Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

ON PULSATION IN THE JUGULAR AND OTHER VEINS.

By T. LAUDER BRUNTON, M.D., F.R.S.

Pulsation in the jugular veins is usually regarded as a sign of tricuspid regurgitation, and therefore of grave import. When I thus speak of pulsation in these veins, I of course exclude the apparent pulsation produced by the motion communicated to them by the pulsation of the carotids, and refer only to pulsatile movements in the veins themselves. Several writers have noticed that pulsations in the jugular veins may occur without any cardiac lesion. Some have attributed these to contraction of the right auricle, while others have supposed them to be caused by the aorta pressing the blood out of the intra-thoracic veins into the jugulars during its distension by the cardiac systole. Some observations which I have made upon jugular pulsation have shown me that it is sometimes due to the distension of the aorta acting in a somewhat different way from that described by Friedrich. I cannot believe that the phenomena I have observed have previously been unnoticed, and I feel quite sure that they must have been already described by older authors, although I have been unable to find an account of them in more recent works. These phenomena consist in apparent pulsation in the left jugular alone, while it is absent from the right. In the first case of this sort which I saw, the apparent pulsation was very marked in the left jugular. On comparing it with the right, I noticed that it also appeared to be much fuller; and when I compressed it just above the clavicle, in order to ascertain whether I could thus stop the pulsation, it filled up very rapidly, and became much distended. This showed that the peripheral vessels by which it was supplied were much dilated, and that blood was flowing very rapidly into it. On compressing the right jugular in a similar manner, it also became very much distended. On relaxing the pressure, it quickly emptied, and when I alternately increased and diminished the pressure, the alternate filling and emptying produced an appearance of pulsation. If it was compressed with the finger simultaneously with each beat of the pulse, an exact imitation of the pulsation observed in the left jugular was produced. It therefore appeared to me that the pulsation in the left jugular was simply due to alternate compression and relaxation of the innominate vein by the aorta during its dilatation and contraction at each beat of the heart. Since my attention has been attracted to this unilateral jugular pulsation, I have observed several cases of it. These have all been females, and all have been more or less anæmic. The following cases may serve as examples :—

Rosana R., æt. 22, cartridge maker, in following her occupation, stands in a close room. About twelve months ago she began to get very pale. She had no fright, but during the course of the last year she has had much worry. The patient is markedly chlorotic; menstruation is regular, but scanty; the bowels are constipated; tongue clean; appetite rather poor. There is an anæmic murmur over the pulmonary cartilage; the cardiac sounds are otherwise healthy. There is apparent pulsation in the left jugular vein, none in the right. When either jugular is compressed, it fills very rapidly. On compressing the right jugular with the finger at each beat of the pulse, apparent pulsation is produced in it. On first beginning to auscultate, the pulsation in the left jugular was very distinct. The heart's action was somewhat excited. As the agitation of the patient subsided, the pulsation in the left jugular diminished, and finally disappeared. It did not return when the patient walked across the room, but she could only be induced to do so slowly.

Digitized by Google

Elizabeth G., æt. 19, is also very pale. For nearly nine months she has had a slight cough, and has been losing flesh. Her appetite is very poor; the bowels are regular; she has not menstruated for the last three months. Percussion sounds are normal. There is a slight click at the end of inspiration over the right infra-clavicular region. The breath sounds are otherwise normal. There is a systolic bruit over the pulmonary cartilage; the heart's sounds are otherwise normal. Pulse, 150, when the patient is standing. The left jugular vein pulsates visibly, but only during expiration. During inspiration the vein empties completely. There is no pulsation in the right jugular, and that in the left is stopped by pressure above the clavicle. It may be imitated in the right jugular by pressure with the finger. There is no distinct venous hum.

Margaret B. came to the hospital complaining of weakness and nervousness. While in attendance, she began to suffer from vomiting, and, a week or ten days after the vomiting commenced, she spat a little blood. Her nose also bled frequently about seven in the evening. There was no abnormal, pulmonary, or cardiac sound. On one occasion, a curious persistent contraction of the jugular vein was noticed at the place where her collar had pressed upon it.

In the case of Rosana R., the pressure exerted by the aorta on the left innominate vein was insufficient to produce the pulsation when the circulation was quiet, but it did so when it was excited by emotion. In that of Elizabeth G., it was insufficient to produce it when the thorax was dilated and the sternum raised by inspiration, but did so when the thorax had collapsed, and the sternum had fallen during expiration. In all of them the peripheral vessels were dilated, so that the vein filled very rapidly during compression, and but for this no appearance of pulsation would have been produced. These few observations may serve to direct attention to a cause of jugular pulsation, which, so far as I can find, is not generally recognised.

There is another venous pulsation which is also omitted from modern text-books, although it is to be found in the older writers. This, however, is not a simulated, but a real, pulsation, occurring in the pulmonary veins, and in the vena cava. Some time ago, Sir Joseph Fayrer and I found that occasionally the pulmonary veins and the vena cava in rabbits might be seen to pulsate rhythmically for a considerable time after the auricles and ventricles had become perfectly still. In one animal, all the cavities of the heart continued to beat for a considerable time after the thorax had been opened. The ventricles then stopped, but the auricles continued to pulsate, as well as the pulmonary veins. The veins and auricles both pulsated at the rate of 119 per minute, but the contractions were not synchronous. The auricles then ceased to beat, but pulsation continued in the pulmonary veins, and the ventricles again commenced, although the auricles remained perfectly quiet. The pulsation of the ventricles was at the rate of eight per minute; while in the pulmonary veins it was at the rate of 46 per minute. Both the superior and inferior vena cava in the same animal were found to be pulsating an hour and forty minutes after the thorax had been opened. From the inferior cava contraction spread like a wave over the right auricle, the ventricle being quiet. But after the auricle had contracted two or three times, the ventricle again commenced to pulsate. These rhythmical contractions of the pulmonary veins, and of the vena cava, occur in animals killed in various ways. Sir Joseph Fayrer and I observed them in animals killed by a blow on the head, by the action of cobra poison, and by the combined use of chloroform, atropia, and physostigma. They do not occur frequently, and the conditions under which they take place are at present unknown, and we are unable to say whether they occur in man at all. But it has been shown by observations on decapitated criminals that the inferior vena cava, as well as the hepatic, portal, and several of the sub-plural pulmonary veins, besides others, are strongly contractile. It seems, therefore, not improbable that such contractions may occasionally occur in the human subject. In one case, as I have already said, Sir Joseph Fayrer and I noticed that the contraction of the pulmonary veins was not synchronous with that of the auricles. The ventricles, at this particular time, were not pulsating, but, had they been doing so, their contractions must needs have been synchronous with those of the pulmonary veins. Supposing that in a case of mitral regurgitation a similar rhythmical contraction should occur in the pulmonary veins, a most powerful obstacle would be opposed to the backward flow of the blood, and the force of the current, driven by the powerful left ventricle into the lungs, would be broken, and the injurious effects it would otherwise produce be greatly diminished. A similar action may be exerted by the vena cava in cases of tricuspid regurgitation.

We have already noticed the persistent contraction which occurred in the left jugular vein in Margaret B., at the point where it had been compressed by the collar. This constriction is an indication of one of the properties possessed by veins which is little regarded in considering the mechanism of the circulation—viz., that of contractility. This property they possess to a very great extent, and it is especially remarked in the smaller veins. In these, the walls sometimes approach each other so closely as to completely obstruct the lumen (?), and altogether prevent the flow of blood through the vein. In them, too, rhythmical pulsations may frequently be noticed. The importance of the venous contractility in reference to the maintenance of the circulation in health and in disease is very great. It is obvious that, if venous radicals contract, they may oppose a resistance to the flow of blood in the capillaries, and by thus increasing the pressure within them may cause more fluid to exude from them into the tissues; while, on the other hand, a rhythmical contraction may forward the onward progress of the blood in the normal condition, and may prevent some of the injurious effects which are usually noticed in tricuspid regurgitation. Everyone who has studied cases of chronic bronchitis must have been struck with the variety of forms in which the obstruction to the circulation manifests itself in them. In one we find considerable œdema, but no albuminuria; in another, great dyspnœa, with signs of pulmonary œdema, although the legs may be very slightly, or not at all, swollen. In the same case you may see the legs begin to swell, and the pulmonary œdema and dyspnœa at the same time diminish. Such an occurrence I have observed in a patient suffering from chronic bronchitis, and who was apparently at death's door from an acute exacerbation of the disease. This patient was obliged to sit upright in bed, gasping for breath; the lips were purple, and all over the lungs there was loud sybillis (?), and rhoncus, with occasionally coarse mucous râles and final crepitation at the bases of both lungs posteriorly. Notwithstanding the interference with the circulation, there was but very slight œdema of the legs. After the administration of an emetic, followed by ipecacuanha and squill, the patient was greatly relieved, but the œdema of the legs increased temporarily. The increase did not, however, last long, and the patient, from the moment of the administration of the emetic, steadily recovered.

The action of drugs upon the veins has hitherto received very little attention, and therefore we are unable at present to bring together pharmacological experiment and clinical observation so as to give us any efficient aid in treatment. But it is probable that before very long we may have some definite knowledge of the action of drugs on the veins, which may help us in many cases, where now we are sadly at a loss in the treatment of those diseases in which venous engorgement plays a prominent part.

THE SULPHUR SPA OF DONEGAL.

By WILLIAM FAUSSETT, A.B., M.B., F.R.C.S.I.,
Clontarf, co. Dublin.

"There can be no question whatever that sulphur waters and sulphur baths do cure, and even better than any other mode of treatment, many diseases of the skin."—See Dr. Kennion, on Harrogate Waters, last edition.

A PAMPHLET, which I published in 1867, on the "Mineral Springs of Lisdoonvarna," had the effect of calling considerable attention to the medicinal value of those waters, and other writers drawing pretty freely on the information therein supplied them, have since confirmed those observations. A very careful and accurate analysis also of their chemical composition, has been made by Messrs. Plunkett and Studdert, who received a commission from the Royal Irish Academy for that purpose. The amount of sulphuretted hydrogen detected by these gentlemen was rather less than that computed by Professor Apjohn, but they discovered a trace of lithia, which however interesting in a chemical point of view, is perhaps too insignificant to have much therapeutic value attached to it as an agent in the cure of arthritic affections. Since the publication of the pamphlet in question, I have visited the several springs of Harrogate, Moffatt, Lucan, and Donegal, and have satisfied myself that compared with Lisdoonvarna the last three are in their action on the human organism, and most probably in their chemical constituents likewise, very similar, though, no doubt, differing to some extent in their actual proportions.

It is remarkable that none of these waters possess aperient or purgative properties, and may, therefore, be judged by some practitioners to be inferior in efficacy and power to the Harrogate sulphur springs.

When, however, we call to mind the fact that chloride of sodium, or common salt, is the principal aperient element in those renowned waters, and that this is a salt of all others which is rarely adopted in prescriptions, the question naturally arises, may not its absence be considered a gain, and may it not be advantageously replaced by some of those in more ordinary use, *e.g.*, a finely pulverised salt, composed of equal parts of sulphates of soda and magnesia? A teaspoonful the dose, added to the spa in the first draught in the morning, will secure the desired effect on the bowels, while the more important action of the mineral is still retained. Dr. Sheil, of Ballyshannon, writes to me to say he had an analysis made of the sulphur spa of Donegal some years ago, by the late Dr. Aldridge, and that it was found to contain sulphur, sulphuretted hydrogen, and sulphates of lime, soda, and magnesia? Waters of this description, however, can never be conveyed to any considerable distance without losing some of their gaseous elements, as no method of corking, sealing, or otherwise securing them, will prevent a certain amount of decomposition; where perfect accuracy, therefore, is aimed at, the analysis must be made at the well's mouth.

The spa of Donegal, from its manifest strength and power, I regard as peculiarly suitable for warm baths, which can always be secured at the spa by giving timely notice to the caretaker. I am satisfied, also, that it is a most active and efficient alterative, removing effete matter from the blood through the emunctories of the skin, the lungs, and the kidneys.

Those several *non*-purgative springs, viz., of Donegal, Moffat, Lucan, and Lisdoonvarna, all act so rapidly and powerfully on the kidneys that in cases where it is desirable to keep these organs at rest, as in albuminuria, Bright's disease, &c., their use is undoubtedly contra-indicated. Again, should there exist an enlargement of the third lobe of the prostate gland, and that the bladder happened to fill up suddenly and rapidly, retention of urine, as I have known happen, would probably be the consequence.

Dr. Hudson, the present distinguished Regius Professor of Physic in the University of Dublin, so well-known for his accurate observation and sound judgment, first called my attention to the virtues of the Donegal spa, of which he seems to have himself had some personal experience.

Having subsequently communicated to him the result of a fortnight's sojourn there last autumn, I had the pleasure of receiving from him the following letter:—

2 Merrion Square, November 29th, 1878.

MY DEAR DR. FAUSSETT,—I am happy to learn that you have visited Donegal with benefit to your health.

I consider that my own health was materially benefited by the internal and external use of the water during a visit I paid to the town some years ago. I have since sent several patients there with satisfactory results from the use of the spa and bath, and I think it much to be regretted on public grounds that these are not made more available, and their capabilities more generally known.

Believe me, my dear Sir,
Very truly yours,
A. HUDSON.

Dr. Faussett.

The old town of Donegal, though impoverished by the want of trade and the absence of a landlord's fostering care, presents some features of interest.

The ruins of an old Castle and fine old Abbey, associated with the memories of by-gone days, call up many interesting reflections to the mind of a thoughtful tourist. The country around is prettily undulated, and in some places tastefully planted. The narrow bay, with its green islands in the distance, and its snug pier for the accommodation of small vessels, always affords abundant opportunities for boating and fishing. Car-hire is exceedingly moderate, and with single, and sometimes tandem, horses, however diminutive in size, an excursionist can manage to visit many places of interest at a very moderate expense. Lough Esk Castle, within three miles of the town, the residence of Mr. Brooks, is a spot of most exquisite beauty, presenting, within a narrow compass, all the elements of wood, mountain, and lake, that can possibly combine to make a landscape lovely. Mr. Brooks himself, who looks a fine exemplification in green old age of a most healthy locality, informed me that some of the neighbouring inhabitants are remarkable for great longevity; in one instance, an humble individual of the poorer farming class, having attained to the extraordinary age of 115. Mr. Brooks appeared to be of opinion that not only sulphur but chalybeate springs must abound in the neighbourhood, owing to the presence of sulphuret of iron ore in the greatest abundance.

The tourist or visitor to Donegal will always find excellent accommodation at Blain's Hotel, where, without any pretension whatever to style, every attention is given to comfort and good wholesome fare, with abundance of meat, fish, and fowl provided, both host and hostess being most attentive to their guests. Mr. Blain, having prior to his residence in Donegal, kept an hotel at Carrick, can afford much useful information as to the readiest mode of reaching that extraordinary region, abounding in scenery of almost inconceivable grandeur and sublimity, unsurpassed, in fact, for magnificence by any other in Europe. The mountain named "Slieve League," having an elevation of nearly 2,000 feet above the level of the sea, is an object which, from its stupendous height, is calculated to fill the mind of the most ordinary observer with wonder and with awe, while the splendid tints and colouring of the naked surface of the rock, when lit up with the sun's rays, present the most gorgeous sight that the human eye can rest upon. The reader will find a graphic description of this wonderful region in Mr. Henry Coulter's valuable and interesting work on the West of Ireland, written by him as the correspondent of *Saunders' Newsletter* in the year 1862, in which he quotes the glowing description of a very able writer from the *Dublin University Magazine* of September, 1866.

The town of Donegal is distant from the railway station

Digitized by Google

of Ballyshannon about twelve miles; cars plying back and forward continually at the rate of sixpence per mile express, or even at a smaller rate with a party.

Clinical Records.

HOPITAL DU MIDI, PARIS.

Amblyopia, symptomatic of Cerebral Syphilisation.

By M. CHARLES MAURIAC,
Physician to the Hospital.

(*Concluded from page 405.*)

The weakness of sight had existed for about nine months, when the eyes of this patient were examined; it was not possible to determine in which eye it commenced, the condition of sight progressively deteriorated, but for some weeks remained stationary.

Many hypotheses might be indulged in, as to the probable cause of the lesion. The following are worthy of notice and comment.

1st. Can we admit that the optic nerves were compressed by a syphilitic exudation, or by a gummatous tumour?

This diagnosis naturally presented itself to the mind. But a tumour so large as to compress both the optic nerves would have also involved the adjacent nerves? We would then have ocular deviation and ptosis of the upper eyelid on one or both sides.

2nd. Would it not be more logical to believe in a syphilitic lesion, having its seat in the corpora geniculata, the tubercular quadrigemina, optic thalami, or the posterior part of the foot of the column of Reil?

Such a lesion would, without doubt, have produced amaurosis, but would it not have been slower, less regular in its process, than in this patient?

Besides, would not other complications have shown themselves?

I may remark, that in this region, in the neighbourhood of the common bundle of all the sensitive and sensorial fibres, it must have been extraordinary, if a morbid production was so circumscribed as only to involve the visior. It must be confessed that one of the most obscure points of cerebral pathology is the real origin of the optic nerves, and the central lesions which may consequently atrophy them. If, with amaurosis, hemi-anæsthesia and hemichorea had existed, we might say, it is certain or probable that the seat of the lesion is in the part posterior of the peduncula. On the other hand, if there had been hemiopia, we might pronounce in favour of a probable lesion of the base touching the optic bandelette.

Right lateral hemiopia, that is to say, abolition of the right half of the field of vision of the right eye, or the right halves of the two retinæ, indicates a lesion of the right bandelette; and *vice versa*, for left lateral hemiopia. As regards temporal hemiopia, or loss of vision in the external half of each eye, it generally arises from a lesion having its seat in the anterior angle of the chiasma. In the patient under notice such lesions had not been observed. Excluding these two hypotheses, we should be led then to admit that the cause existed in some of the centres of innervation in the cortical layer of the hemispheres.

May we not believe, that the disorders of the eye and vision have some affinity of origin with the lesions from which result aphasia and right hemiplegia?

This appreciation would be too vague and hazardous, and I would not have put it forward, if some facts did not come to my support.

In a recent work, my learned colleague and friend, Dr. Luys, amongst many other interesting cases, reports the following—

A woman, æt. 66, lost successively, the sight of the right and left eye, whilst at the same time severe pain came on in left frontal region. She attributed her blindness to excessive work at sewing.

This patient died of some acute disease, and an ophthalmoscopic examination of eyes was not made. On examination of the brain after death the following characteristics were found: The optic nerves were notably atrophied, the right had a greyish tinge. The tubercula quadrigemina and corpora geniculata were also atrophied, similar lesions in optic thalami. But where M. Luys noticed remarkable peculiarities, was in the frontal convolutions. The first and second frontal, about two centimetres above their emergence from the sub-orbital lobe, presented some ulcerations formed by a very notable softening of the cerebral surface. They were surrounded by a very close vascular network, with adherence of the pia mater to the subjacent tissues.

M. Luys adds, that this was the third example he had met with of the coincidence of a general lesion with alteration of sight. Thus the functional suppression of vision had, in the three facts observed by M. Luys, been due to atrophic degeneration of a circumscribed portion of brain, and this was exclusively confined to the frontal convolutions.

Must we not conclude that a close anatomical connection exists between the optic nerves and the grey cells of the frontal lobes, and that this anatomical connection creates between the two parts a functional solidarity, so that when one of the portions is injured, the other shares in the lesion. And since atrophy of the optic nerve carries with it atrophy of the frontal convolutions, may not a reciprocal action take place? Is it not legitimate to suppose that atrophic degeneration of the convolutions may produce amaurotic complications and atrophy of the papillæ?

Was not such the case in this patient? It was evidently the left frontal lobe which had been attacked by syphilitic determination. At the commencement—at the epoch of the attack of aphasia and right hemiplegia—the principal seat of the lesion was the third left frontal. But it is possible, that by little and little, it extended to the neighbouring parts, attacking the centres which are in anatomical relation and physiological solidarity with the optic nerves.

It is a complex question. My patient exemplifies a possible cause of syphilitic amblyopia. In all cases we should not search for the cause in the nervous apparatus of the eye, but rather in the centres from which emanate sensorial innervation. The lesion may be central or peripheral.

Special.

MEDICAL ACTS AMENDMENT BILL.

The Select Committee on the Medical Acts Amendment Bill held a fourth sitting on Friday, June 27th, when the further examination of Mr. John Simon, C.B., F.R.S., P.R.C.S., late Medical Adviser to the Privy Council, was proceeded with by Mr. Wheelhouse, the hon. member for Leeds.

The Oxford Medical School.

Mr. Simon concluded that Oxford afforded only the preliminary scientific education of a medical student, but urged that an eminent distinction must be drawn between the education afforded, and the examination conducted, by the University. In discharging the latter duty outside assistance was sought, and men fully competent to undertake the office of examiner tested the capabilities of candidates for the University degree.

Irish Students.

Mr. Wheelhouse wished to know if the witness had heard any complaints that the period of education had been so reduced in Ireland that students at some places in that country are permitted to qualify in a little over two years. Mr. Simon said he was not aware of any such fact, which if it existed, would indicate a most improper state of things, and he thought that in such a case as this the Medical Council should at once enforce amendment, if it had the power to do so. Neither had he heard that students attending at some Irish educa-

Digitized by Google

tional institutions were not placed on the register, such registration being part of the duty of the branch Council for the country.

THE BRITISH MEDICAL ASSOCIATION

was referred to by Dr. CAMERON, as having very freely criticised the acts of the General Medical Council, which body it expressly charged with refusing to accept extended power of action. Mr. Simon replied that it was historical how the Medical Bill of 1870 had been wrecked, entirely through the attempt of the Association to force the abuse relating to direct representation, but that the General Council were entirely in accordance with the provisions of Lord Ripon's Bill, including that which would have conferred a greatly increased power on the Council. A considerable amount of evidence as to the General Council, which was given, was a mere recapitulation of that already published in abstract in these columns; but on the subject of a

CONJOINT SCHEME,

Mr. SIMON said he did not approve a *single* Board for the three kingdoms. He wished to see a separate Board constituted for each, with a general Board or Council of supervision. From this there might be a right of appeal to the Privy Council. He could not agree with the British Medical Association that progress had been obstructed by the constitution of the General Medical Council, but, on the contrary, felt certain that the Medical Association was itself a prominent obstructive, as evidenced by its conduct in regard to the Bill of 1870. The witness then explained the nature of the opposition stirred up against the Bill, and described it as factious and impetuous, quoting in support of his theory some passages from the defunct *Medical Mirror*. He did not think plebescite votes by distributed papers at all a satisfactory method of ascertaining general opinion; and in regard to direct representation he closely followed Dr. Acland's testimony on the same point. Mr. Simon, while contending that the Council worked well, and will suffer from direct representation of the general practitioner on it, is of opinion that its numbers might be advantageously reduced, and its business thereby expedited. He is convinced that the powers at present vested in the Council are insufficiently large, and thereby its working is so far defective; but this in no way, according to him, affects its constitution. While dissenting from the universal suffrage proposal, he thinks that every man who enters the profession should be able to feel that on attaining a higher grade of qualification in the corporation that has licensed him, he will have a voice in electing the officers of his Society. And as these latter decide the representation on the Council, this choice will indirectly rest with the younger licentiates also.

QUALIFICATION.

Mr. SIMON said he admitted with regret that a great number of practitioners whose names were contained in the Register boasted only a single qualification. Dr. Lush then pointed out that of the six Crown nominees on the General Medical Council, five held only *one* qualification. Mr. Simon, while avowing himself as singly qualified (R.C.S.) said he believed that some of the gentlemen mentioned ought to possess surgical or medical licenses, as the case may be, but that they were accustomed to employ only one or other respectively. In former times, he continued, it was a caution to a man entering on surgery to beware of medicine, and *vice versâ*; all these considerations must be taken into account in discussing the point raised by Dr. Lush.

ROYAL COLLEGE OF PHYSICIANS.

Mr. SIMON said that the Royal College of Physicians claimed, in virtue of an Act of Henry VIII., that its licentiates, members, or fellows might practice equally, medicine or surgery. This right is recognised by the Local Government Board, the Royal College of Physician's diplomas conferring a double qualification on the possessor. Some years ago, he added, the College of Physicians obtained the assistance, since continued, of Fellows of the Royal College of Surgeons, in examination of candidates for its diplomate. No examination exists for the Fellowship of the College.

SCHOOL OF MEDICINE FOR WOMEN.

LORD ABERDARE presided on Thursday at the annual distribution of prizes to students of the London School of Medicine for Women, 30 Henrietta Street, Brunswick Square. Among those present were Mr. Stansfeld, M.P., Mr. G. J. Shaw-Lefevre, M.P., General Waddington, Mr. Hopgood, Prof. Allen Thompson, Dr. Elizabeth Blackwell, Miss M'Laren, M.D., and Miss Louisa Stevenson. The Dean of the School, Mr. A. T. Norton, F.R.C.S., in opening the proceedings, said, that this session terminated the second year of the School since its recognition as a school of medicine in association with the Royal Free Hospital. In all 56 students had entered the School since its foundation, of whom 11 joined in October last. Altogether 11 of these students were, or would be, engaged in medical missionary work. Five ladies who had been partially, and one wholly educated here had been registered as qualified medical practitioners. One lady had come back from Africa in order to obtain a medical degree, had studied at this School, obtained the licence of the King's and Queen's College of Physicians of Ireland, and had since returned to Livingstonia, on Lake Nyassa, to continue her missionary and medical labours. He was glad to say that, of the small number attending the School, 5 were preparing themselves for the medical degrees of the London University. In conclusion, he drew attention to the course of science lectures given at this institution to ladies who wished to complete their studies in such subjects without desiring to become doctors. The prizes were then awarded, the principal prize winners being Miss Prideaux, Miss Marston, Miss Kenealy, and Miss Cradock.

Lord Aberdare congratulated the meeting and all who had the same cause at heart upon the progress made in the movement to place women on a social equality with men in all matters in which such equality was desirable. He alluded more especially to the enlargement of the charter of the University of London so as to admit ladies to all degrees of the University. The Royal Free Hospital, with which this School was connected, had been recognised as a medical school by the Senate of the University of London, so that at last the principal obstacles which had prevented their progress had been effectually removed. He was glad to say that the Medical Acts Amendment Bill had been somewhat improved in its passage through the House of Lords, and he hoped that any objectionable clauses remaining would be removed in the other House. In conclusion, he dwelt upon the great service rendered to this institution and to society by the efforts of those, and of the ladies especially, who had opened a medical career to women.

Mr. Stansfeld, in making a financial statement as honorary treasurer, said that including cash in bank, £744 from subscriptions, and £742 from students' fees, the receipts for the year were £2,197, and the expenditure, including subscriptions to the Royal Free Hospital of £315, amounted to £2,125. After speaking at some length on the financial position of the school, he called attention to the scholarships. Besides their own entrance scholarship, there was one founded by the Birmingham Ladies' Association for the Education of Women, worth £30 a year, and tenable for three years; and another bestowed by the National Association for Promoting the Education of Women—a society having their headquarters at Edinburgh. He also acknowledged a donation of twenty guineas from the Clothworkers' Company. The school was greatly indebted to the hon. secretary, Mrs. Thorne, for her self-sacrificing labours to secure the success of the institution. As to the Medical Acts Amendment Bill, that measure was before a Select Committee, and there was practically no chance that the Bill would pass the House this session. Knowing the amount of professional jealousy—indeed of male jealousy—which the Bill had excited, he was sure that it would be necessary to watch its provisions closely.

Mr. Shaw-Lefevre moved a resolution, declaring the satisfaction of the meeting with the progress made by the school during the year. Mrs. Westlake seconded the motion, which was supported by Mr. Critchett and carried unanimously.

OPENING OF THE PARKES MUSEUM OF HYGIENE.

A NUMEROUS and brilliant company assembled last Saturday at University College, Gower Street, to assist at the inauguration of the Parkes Museum of Hygiene. The Right Hon. R. A. Cross, Secretary of State for the Home Department, presided. He was supported by the Right Hon. Viscount Cranbrook, Secretary of State for India, His Grace the Duke of Northumberland, Earl Fortescue, Cardinal Manning, Sir Thomas Watson, Sir William Jenner, Professor Huxley, the Council and Staff of University College, &c. The right hon

Digitized by Google

gentleman opened the meeting in a few practical and sensible observations on the value of the labours of the late Dr. Parkes, and the importance of the collection which he had had the gratification of inspecting, and which no doubt would directly subserve the studies of officers of health, architects, engineers, and others, on whose special attainments the public health so largely depends, and prove of immense advantage to the public. The collection has been methodically arranged, and select illustrations of very many departments of hygiene are exhibited in sections. Great praise is due to the committee, who have laboured to bring the museum to its present state. It is, however, we need scarcely say, far from complete. Indeed, the committee must have very soon discovered that the term hygiene is capable of very wide application, and therefore, seeing that their space was limited, have mainly confined their efforts to an attempt to illustrate visually the various subjects which are treated of in Dr. Parkes's comprehensive book on Practical Hygiene. The various articles exhibited are carefully arranged in six groups, under the headings of, 1. Engineering and Local Hygiene. 2. Architecture. 3. Furnishing. 4. Clothing. 5. Food. 6. Preservation and Relief. To these a library, which is a very important and necessary addition, has been added, so that in time the Parkes Museum will become a great centre of reference for students and all persons in search of knowledge on hygiene.

For the benefit of those who are specially engaged in sanitary work, a department has been instituted for demonstrating the uses of hygienic apparatus, and this is wisely placed under the direction of Professor Corfield, whilst a curator, Mr. Judge, is placed in charge of the collection generally, and attends on the mornings of Tuesday, Thursday, and Saturday to facilitate their inspection, and answer all inquiries. The committee, it should be known, have received valuable aid from Mr. T. Twining, of Twickenham, whose labours in sanitary matters have extended over many years, and in addition to a donation in money, this gentleman placed at their disposal an useful contribution of museum fittings, together with serial illustrations and a collection of food articles. He also prepared a convenient synopsis of the proposed scope and classification of the museum, and materially assisted in other ways by his extensive experience in matters pertaining to sanitary work.

Her Majesty the Queen has shown her gracious approval of what has been done for the instruction of the public by a munificent donation, and His Royal Highness Prince Leopold, as well as other members of the Royal Family, have given the scheme their cordial support. The Government of this country, as well as that of the United States of America and the City of Brussels, have also contributed various articles and reports; and Sir Joseph Hooker furnished from the Museum of Economic Botany at Kew a useful collection. Altogether, the museum has made a good beginning, but it is manifestly far from being complete. A museum must be a thing of slow growth, and the collection is a mere skeleton of what we hope it will be. "Whether the hopes and intentions of the committee," as the report says, "are to be realised, depends entirely upon the public." Those who have laboured to bring it to its present condition have however so far given a good account of their stewardship, and we feel certain that both funds and materials will be forthcoming to make the Parkes Museum a national and a useful institution, worthy of the important subject which it illustrates, and the great name it bears.

Special Correspondence.

[FROM OUR CORRESPONDENT WITH THE AFGHAN ARMY.]

CHANGES IN THE INDIAN MEDICAL DEPARTMENT.—A recent number of the *N. W. P. Gazette* contains a notification that a Deputy-Surgeon General, Indian Forces, has been placed at the disposal of the local Government, and that this officer will hold henceforth charge of the Civil Medical Department in those provinces. This measure marks a new starting point in medical administration. The civil duties of the Indian Medical Department, which is essentially a military one, will henceforth be severed from the charge of troops. The deputy-surgeons general who superintended civil and military duties alike were often inexperienced in those of the former. This led to much inconvenience, which will be obviated by the new arrangement. The civil surgeons will be now entirely subordinate to the local Government under which they serve. Under the new scheme, inspectors-general of dispensaries will cease to exist. The civil appointments appertaining to the Indian medical service, some of which are very lucrative, are, as a rule, medical charge of jails, civil dispensaries (kept up by the municipalities), rajahs, or rich nawabs, or native noblemen, ordnance department, private practice, which latter depends much upon the local reputation of the surgeon. Some young and active officers of the Indian medical service hold several of such appointments, as well as the charge of a Sepoy regiment.

CHOLERA IN INDIA.—Since the breaking up of the Hurdwar Fair, between 10th and 12th April, cholera, which is stated to have caused several thousand deaths among the Hindoos there assembled, has been brought by them into several stations in the North-west Provinces and the Punjaub. Local outbreaks follow only immediately upon their arrival. It has now appeared at Lukkur, the starting point for Candahar, and through which our returning troops must pass. The sanitary condition of the East is described as bad in the extreme, and in many parts the stench—from decomposing dead bodies and want of due attention to surface conservancy,—as abominable, very favourable conditions for its spread.

RETURN OF THE TROOPS TO INDIA.—It is rumoured that on the conclusion of peace with Yakoob Khan, the greater part of the troops will march back in June to the Plains. Hopes are universally expressed that such a move, which must lead to great hardships, will be avoided.

THE NEW DISEASE.—Surgeon-Major Joseph O'Brien, Civil Surgeon, has published some interesting notes on "Acute Dropsy," from which we gather that the disease may be propagated by contagion and imported. Several instances are given.

DEATHS OF MEDICAL OFFICERS IN INDIA.—We regret to announce the deaths of three surgeons-major of the British service—Drs. Kilroy, Jamieson, and P. J. Clarke. The first occurred at Nainee Tal from cholera. Surgeon-Major Clarke (brother-in-law to Professor Mapother, Vice-President, Royal College of Surgeons in Ireland) died at Dinapore. He entered the service 17th March, 1849, and saw over thirty years' service. Dr. Clarke served in the Crimea, Indian Mutiny, and during a severe epidemic of yellow fever at Barbadoes, for which he received the thanks of the military authorities. He also held the onerous appointment of Recruiting Officer in Dublin, officiating for some time as Surgeon-General and Principal Medical Officer of the Dublin Prison. After a long and laborious service in the army, he was passed over (like Dr. Todd and other well-known officers) by the head of his department on grounds which, to outsiders, appeared flimsy and childish in the extreme. Indeed, we believe some occurred subsequently to his removal from his appointment. Dr. Clarke made a gallant struggle for his rights, but with little result to himself; but we are in a position to state, with the effect of directing special attention to the proceedings of the gentleman in Whitehall Yard, whose popularity gained little by the correspondence which he published. Dr. Clarke leaves many friends among his late brother officers, with whom he was always popular.

CHANGES IN THE ADMINISTRATIVE APPOINTMENT IN INDIA.—With a view to economy, we are in a position to state that, at the termination of our difficulties with Cabul, the question of the dual appointments in the administrative ranks will receive the early attention of the Indian Government—one deputy-surgeon general only being retained in each circle.

SICK AT THE FRONT.—By latest advices from Gandamak we hear more than 600 sick are in the hospital of this division. The Rifle Brigade has most sick in hospital. Since the last news a correspondent writes to us: "The most horrible smells arise in all directions."

PRINCIPAL MEDICAL OFFICER IN INDIA.—Surgeon-General Innes, C.B., has just returned from a tour of inspection of the hospitals at the front. He accompanied the Commander-in-Chief, and is stated to have been pleased at the result of his visit. Up to the present no strain has been put upon the arrangements, which would have been amply tested had the army marched to Cabul.

CHOLERA IN 15TH HUSSARS.—Since the return of the regiment to Meerut from Kandahar, 10 seizures occurred, out of which 8 proved fatal. The admissions were confined to B Troop, who occupied a carriage used by some of the Hurdwar pilgrims in returning to the Punjaub. An investigation into the circumstances is being carried out by the authorities.

DISCOURTESY TO ADMINISTRATIVE OFFICERS IN AFGHANISTAN.—A correspondent of the *Civil and Military Gazette* comments in no measured terms on the discourtesy shown to Dr. Gibbon, Principal Medical Officer, Colonel Hunt, Chief Commissariat Officer, and the Chaplains to the Forces, at Sir Samuel Browne's reception of the Ameer at Gandamak, in not being amongst those specially invited to be present, while several members of the Press were officially invited to be present.

SURGEON-MAJOR PORTER.—Surgeon-Major Porter, late Assistant Professor of Military Surgery at Netley, is at present in charge of the 1st Field Hospital at Jellalabad. His services would no doubt have been appreciated as they deserve had the army advanced to Cabul. The abrupt termination of the campaign has been a disappointment to many officers, who are tired of the monotony of inaction in the Khyber.

SPECIAL CORRESPONDENT OF THE "STANDARD."—Mr. Frederick Boyle, of Ashantee and Bulgarian notoriety, has been getting into scrapes with General Maude for his rather free speaking about the not very creditable affair at Dakka. Mr. Boyle's telegrams were refused, but we understand such absurd restrictions on free comment are likely to be removed. Mr. Boyle has made the Indian public acquainted with his wrongs through the *Pioneer* and *Civil and Military Gazette*.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 2, 1879.

THE MEDICAL COUNCIL WITNESSES BEFORE THE SELECT COMMITTEE.

UP to Friday, the 27th ult., four days had been occupied by the Select Committee on the Medical Acts Amendment Bill in receiving evidence from two witnesses. It is true that the official position of both these gentlemen is sufficiently important to make it advisable to receive whatever testimony they can adduce in support of a measure of reform; but viewing the evidence as it has been reported in our columns, by our own Commissioner, it is impossible to repress a feeling of intense disappointment at the really valueless nature of the work accomplished at a cost of so much valuable time. It took two days of four hours each, for Dr. Acland to wriggle about the definition and meaning of plain, straightforward terms. Eight hours to extract from him the information which, with a ready and spontaneous answer to each pertinent question as it was propounded, might have easily been expressed in a sixth part of the time.

There is little in Dr. Acland's evidence to call for the congratulations of the body over which he presides; and we venture to believe that the General Medical Council will scarcely support him, *en masse*, in his ascription to it of that degree of perfection which brings it only just within the pale of human works.

Though Mr. Simon has been a little less rapturous in his appreciation of the immaculate constitution of the Council, he nevertheless exhibits a most unbending conservatism on the subject of direct representation. The laboured reasoning of both witnesses against a perfectly obvious measure of right and good would have been amusing to see, had the conviction not been forced on the observer that the chief officers of two such important and influential bodies as the General Medical Council, and the Royal College of Surgeons, were thus blind to the signs, and the exigencies of the times. Moreover, it is exasperating to note how grievously wasted the precious time is; a fifth meeting of the Committee will, in all probability, have determined only the conclusion of the examination of two witnesses. At this rate of progress, when can it be hoped that the labours of the Committee will have ceased? Far too late, even now, to admit of any final legislation during the present session, and hence another year must be born ere a move can be made in the direction of purging the profession of the stigma that endangers its prestige.

We are justified in decrying such unsatisfactory evidence as is much of that already tendered. It is reprehensible in a witness to attempt to evade a direct reply to a question set with the object of eliciting information necessary to guide the Committee in arriving at a decision on an essential point; and we cannot speak too severely in reproof of any attempt to shroud round the simple truth with an atmosphere of vague generality. Time is lost thereby; confidence in the witness is rudely shaken; progress is impeded; and no benefit can possibly accrue from such a course, save the paltry satisfaction an individual may experience in having successfully withheld his real opinions, or concealed the real facts that exist.

The evidence of the President of the General Medical Councill was an elaborate, but ill-concealed, *suppressio veri*, an effort to cover the information which was demanded from him in that cloud of diplomatic words which are "made to conceal our thoughts." That of Mr. Simon was the dogmatic assertion of his opinions, marked by an admitted unacquaintance with the facts bearing upon those opinions, and by an almost diametric variance from the views held by the great majority of the profession. Taken together, the testimony of these leaders of the Medical Council has been invaluable to the cause of medical reform, for it must have gone far to satisfy the Select Committee

Digitized by Google

that a Medical Council formed of such material would probably be as impractical as its assailants represent it to be, and, furthermore, that the Crown nomination of members of the Council, being exercised in favour of stilted respectability rather than administrative ability or exhaustive knowledge of medico-educational subjects is misapplied, and needs to be directed into a different groove.

THE MEDICAL PROFESSION.

When the Metropolitan Counties Branch of the British Medical Association met last Wednesday to discuss the subject of the professional education of the general practitioner, they took, we consider, the initiative in an important and much needed reform. Many members were present at the meeting referred to, and Dr. Andrew Clark, the able President of the Branch, explained the object which they had in view. He said that the present system of education was defective, inasmuch as it did not sufficiently provide for the instruction of the student in ordinary practical matters, and that the latter was under the necessity of devoting too much attention to subjects, a knowledge of which was of comparatively little importance to the general practitioner. Among the members who spoke on this occasion we may mention Dr. A. P. Stewart, Dr. Joseph Rogers, Mr. Christopher Heath, Dr. Silver, Dr. Edis, Mr. Sibley, and Dr. Semple; and the result of the meeting was that a Committee was appointed to collect information on the subject from teachers and practitioners, and to report to an adjourned meeting to be held on Wednesday, July 16th.

That the curriculum of study which the student has hitherto had to observe is defective, that the actual work done by him at the hospitals is far short of what it ought to be, and that much valuable time, which ought to be devoted to practical medicine and surgery, is sacrificed to the learning of the collateral sciences, we have long been convinced. No doubt the Committee above-mentioned will, in the course of their investigation into the present state of hospital teaching, find that there is plenty of room for improvement. But if they wish to go to the root of the question, and to find out all the hidden springs of the incompetence so often shown either by the student at his pass examinations, or by the practitioner engaged in practice, we strongly advise them not to collect their information from the teachers and practitioners only, but to interrogate students themselves on the subject. They might also gain many hints from some of the examiners belonging to our several examining bodies, considering that the latter have so many opportunities of knowing in what respect candidates most frequently fail. Probably, for instance, the examiners at the Royal College of Surgeons could give some important information respecting those points of practical surgery in which candidates are apt to display the most ignorance, while similar and valuable evidence might be given by some of those gentlemen who are attached to the examining staff of the Royal College of Physicians, or the Apothecaries' Hall.

The subject for the consideration of the Committee seems to us to divide itself into two parts. First, there is the question as to what amount of time should be devoted to theoretical and practical studies respectively? And, secondly, there is the question whether some of the subjects which now take up a good deal of the students' time at the hospital might not more satisfactorily form a part of his general education? With regard to the ancillary and more theoretical branches of knowledge, the propriety of leaving to private study and periodical examinations, much that is now taught by elaborate lectures is well deserving the careful consideration of those who would make our medical schools more perfect than they are at present. It is, however, in practical instruction, that medical teaching falls so short of the requirements of the present age, and the British Medical Association will have accomplished more than they ever accomplished before, if they can suggest some plan by which no student is allowed to leave the schools until he has given some proof of being tolerably well acquainted with the more *practical* duties of his profession. That school will approach nearest to perfection whose teachers take care that no student shall leave its portals until he is at least *au fait* at the performance of all the minor operations of surgery, at the more common operations of midwifery, and in the use of the various instruments of diagnosis with which both the physician and surgeon are now furnished. The reasons why so many are, on entering the profession, ignorant of the most common matters of routine practice will deserve careful consideration, as well as the best means by which this evil may be remedied. It cannot be denied that too much attention has been of late paid to examining bodies, and to the efficiency of their examinations, while too little attention has been given to that fountain head of medical education, the medical schools.

The question, too, of transferring the study of some of the preliminary subjects, such as chemistry and botany, from the medical to the general schools, is a very important one. We have no doubt that the time will come when this plan will be adopted. For considering that the elements of the natural sciences are already taught in most of our public schools, surely it might be arranged that the subjects above-mentioned form a part of the preliminary general education of the student, so that the time now spent in listening to lectures on these subjects might be devoted to more purely professional studies.

For these and other reasons which we cannot now specify, we gladly support the movement to which Dr. Andrew Clark has given the weight of his authority. We notice, however, that the adjourned meeting of the Metropolitan Branch of the Association is to be held in the course of a fortnight, and wonder how the Committee can expect to collect much information in so short a time.

Notes on Current Topics.

The Harveian Oration.

Dr. Wilks' Harveian Oration at the Royal College of Physicians on Thursday last was an eloquent vindication of the claims of science, and of men of science, on the general interest and appreciation of the public. Wisely abstaining from any tedious demonstration of a technicality, Dr. Wilks treated his auditors to an able and

Digitized by Google

spirited discourse in defence of medicine and "medicine men." Calling attention to the watchword of the College, the command left by Harvey to investigate Nature through experiment, he explained the real meaning of the dictum, and demonstrated the direction of legitimate scientific inquiry. At some length he dwelt on the relation of physiology and medicine, and enforced the conclusion that all present knowledge of the functions of the human organism is at best only tentative, while we can never hope for a full and perfect recognition of the great truths of physiology until such time as these have been unfolded by, and through, the unceasing study of vital activities, normal and morbid. He strongly deprecated the action of the sentimental army, who strive to stay the progress of knowledge on the ground that this should not extend to things that are in their nature sacred. No limit, he urged, can be legitimately placed to the inquiries of man seeking an explanation of the mysteries within himself. In order to attain to absolute information, he is justified in adopting the means that seem to him the most fitting aid to the accomplishment of his purpose; and Dr. Wilks expressed a just indignation towards those writers who exert popular power in diverting the minds of the great unreflecting masses of society to antagonism with the prosecutors of scientific research.

Referring to the admission of women into the profession, Dr. Wilks drew attention to the common fallacy which described a medical practitioner as one who "administered" physic. If this definition of a physician held, there could arise no doubt that a woman is the one most fitted to undertake professional work, but his hearers would recognise the gross error involved in the conclusion, and he could willingly trust the profession at large to exercise the power they held to influence the progress of the movement in favour of the qualification of females, with a conscientious regard for the integrity and nobility of the profession.

The address was characterised throughout by a liberalism in thought, freedom of expression, and a scholarly finish, that serve to make it one of the most interesting and impressive of the orations in commemoration of the great discoverer of the circulation.

On the conclusion of Dr. Wilks' discourse, the Baly Medal, a biennial award for extraordinary research, was awarded to Dr. Charles Darwin, the author of the "Origin of Species," who received an enthusiastic welcome from the assembly.

Dr. Acland upon Irish Conjoint Examination.

By way of illustration of the want of knowledge of the subject, evidenced by the testimony of the President of the General Medical Council given before the Select Committee, we note his reported statement, that "As to conjoint examination, Ireland was equally divided in opinion, rather, perhaps, against than for."

It might have been reasonably expected that the head of the institution which is supposed to regulate medical education would have known—

a. That every licensing body in Ireland was prepared and pledged to co-operate in conjoint examination, save the Queen's University;

b. That the scheme for a conjoint diploma fell through only because the Queen's University refused to co-operate, and because, if the Conjoint Scheme had been completed, that institution would have been at liberty to give Doctorates of Medicine at £5 a-piece, and on a half-price curriculum, while the conjoint examinee would have had to pay £30, and a full-cost education;

c. That, in view of this contingency, the whole of the other licensing bodies were obliged to refrain from examinational reform;

d. That the General Medical Council was at the bottom of this failure, because it neglected to require uniformity of system, which it might have done if it had so pleased.

The Convalescent Home for Dublin.

We greatly regret to observe that the effort made by a few philanthropists to establish a convalescent home for infected patients from Dublin hospitals has failed. At a meeting of the supporters of that proposal, held last week, it was resolved—"That, inasmuch as the efforts of the executive committee to establish a convalescent home for persons recovering from infectious diseases have hitherto proved abortive, owing to the comparatively small sum which has been contributed by the public in aid of the movement, this meeting is of opinion that it is desirable to call upon the Public Health Committee of the Corporation, acting as the Urban Sanitary Authority of Dublin, and in co-operation with the urban sanitary authorities of the suburban townships, to establish a convalescent home such as is contemplated, in accordance with the powers given those sanitary authorities under section 155 of the Public Health (Ireland) Act, 1878. Further, that a sum of £1,000 be contributed out of the funds collected up to the present in aid of the establishment of a convalescent home under the said provisions of the Public Health Act, and that the sanitary authorities in question proceed to found such an institution, subject to the consent of the subscribers."

A medical contemporary says, "What will the Corporation do?" Echo answers, "Nothing." The Public Health Committee of the Corporation have neither initiated nor encouraged this movement (nor, indeed, any other for improving the health of the city). They will be well pleased if sanitarians will only let them alone, and not keep bothering them with nasty vital statistics, or pestering them to do something to save life. "Dublin," say they, "is pretty well, and will get on comfortably enough if you keep never minding the deaths of a few hundred beggar children." It is all the "fault of the weather clerk and the sub-soil of the city, and it is ridiculous to expect us to trouble ourselves about it. Besides, if we acknowledged that Dublin was a pest-hole the public would keep aloof, and then what would become of the lodging-housekeepers and shopkeepers? and, moreover, the owners of tenement-houses would serve us out at the next elections."

We rather think that the promoters of a convalescent home will be more surprised than pleased if the Public Health Committee should accept their offer.

Joseph Lister, Esq., F.R.S., LL.D. (Univ. Dub.)

Mr. Lister visited Dublin on Wednesday last for the purpose of receiving the degree of LL.D., *honoris causâ*, from the University of Dublin, in consideration of his distinguished services to surgery. On the following day he gave a demonstration of his method of antiseptic dressing in the theatre of the Richmond Hospital, in the presence of a large number of surgeons and students. Amongst those present were Dr. Kidd, Professor Bennett, Dr. Robert McDonnell, F.R.S., Dr. Banks, Dr. Ormsby, Mr. Alcock Nixon, Dr. Darby, Messrs. W. Stokes, W. Thomson, W. Thornley Stoker, and A. H. Corley, Surgeons to the Hospital. Mr. Stokes introduced Mr. Lister, who then gave an interesting and lucid description of the method of antiseptic dressing. He urged thoroughness and the closest attention to every detail, observing that it would be much better not to attempt it at all unless it was carried out properly. At the close of the address a vote of thanks was passed to Mr. Lister, on the motion of Mr. Stokes, seconded by Mr. Corley.

Property Disqualification of Poor-Law Guardians.

A rather interesting question, which was recently submitted to the Local Government Board by the Guardians of Omagh Union, has been replied to. The Guardians desired to know if a person deriving any pecuniary benefit from the rates of the union was disqualified for being a member of a dispensary committee within the union. The reply of the Local Government Board to this question states in effect that persons deriving emolument by salary or by superannuation allowance from the rates, or contractors for supplies to the workhouse, are not disqualified for acting as members of dispensary committee, but a member of a dispensary committee who supplies medicines or other goods for the use of a dispensary in his district is liable to a penalty of £50.

Condition of the Thames Water.

One would have thought that the enormous amount of rain we have had this year would have made the water of our rivers purer than it has been for some time, at least so far as the presence of organic matter is concerned. But, according to a recent report of Colonel Bolton, the metropolitan water examiner, this does not appear to be the case. He says that the state of the water in the Thames at Hampton, Moulsey, and Sunbury was indifferent from the 1st May to the 5th; it then became good, and remained in that condition until the 28th, when it became very turbid, and was bad for the rest of the month. The water in the Lea was indifferent during the early part of the month.

St. Andrews Graduates' Association.

The anniversary session of the Association was held at the rooms of the Medical Society of London, on Wednesday last, and the dinner at the Langham Hotel the same evening. Dr. Macintyre, of Odiham, presided. The re-union was of an agreeable character, and the following gentlemen were elected as the Executive for 1879-80:—President of the Council: Dr. Richardson. Honorary Treasurer: Dr. Paul. Honorary Secretary: Dr. Sedgwick. Council: Drs. Cleveland, Day, Dudfield, Holman, Macintyre, Royston, Seaton, Wiltshire, Cooper Rose, G. Bird, Falls, Granville, Kesteven, Mott, Roberts, Stocker Weir, Archibald, Dale, Graves, Henry, Hetley, Iles, Kershaw, Madge, Smith, Prof. Pettigrew, and Mr. Menzies.

Vivisection.

We lately drew attention to the able manner in which Dr. Walker, of Peterborough, exposed the fallacies of the anti-vivisectionists. We are pleased to see that at a recent meeting of the Anti-vivisection Society at Warwick, Dr. John Tibbits was equally successful in contradicting the sensational and calumnious attacks which the agent of that society made upon the medical profession. The result of the meeting at Warwick was the same as that of the "lecture" at Peterborough. The lecturer did not succeed in getting his resolution passed, he met with an amount of opposition he little expected, and the meeting broke up in confusion.

Apropos of this subject, we may remark that in a capital leading article on Dr. Wilks' Harveian Oration, the *Times* did not flinch from noticing the mischief which ensued from the intemperate agitation which has now for some time been going on against this method of experiment. "If we ever," says our contemporary "see an economy of nerve force which would throw all other conceivable economies into the shade, it will be attained by perseverance in the investigations which Marshall Hall and other medical physiologists have commenced, *and which have been so far hindered among ourselves that we must either submit to expatriate our best workers or to receive our knowledge at second hand from the countries of Continental Europe.*"

The Temperance Movement.

In many respects the "Temperance Movement" is moving in a right direction. A few days ago the Earl of Shaftesbury opened at 161 Westminster Bridge Road, the first of a series of cocoa rooms to be opened by Mr. Dockhart in various parts of the metropolis, the object being to provide the working classes with light refreshments in general at a moderate cost. His lordship said it was an admirable movement, and he wished it every success. So do we; and hope that these and similar establishments will prove successful sets-off against the temptations of the public house. Plenty of such places of innocent refreshment and recreation, improved dwellings for the working classes, all possible encouragement to thrift and cleanliness, and a plentiful supply of pure water—these are the most rational means of improving the habits and welfare of the working classes.

Consumption of Opium and Ether by the Public.

Some correspondents, in a recent issue of the *Alliance News*, have been drawing attention to a fact not generally known in this country, namely that in some parts of Ireland the habit of ether drinking exists to a very great extent. Mr. T. W. Russell admits that there is a district in the County Derry—Draperstown—especially where the

Digitized by Google

consumption of ether has been going on for years. It is also stated that "in Tyrone, Antrim, and the parts of Fermanagh adjacent to these counties, ether is largely consumed. Small grocers sell four Winchester quarts weekly to his (the writer's) knowledge." It has also been asserted, but without any foundation whatever, that the habit has increased since the passing of the "Sunday Closing Act."

In the same paper there is a long letter from a correspondent, H. P. G., who, after referring to some remarks we recently made on the subject of laudanum drinking, regrets that the profession does not advocate the same restriction being put upon the sale of alcohol as they would have put upon the sale of opium. "Has not," says H. P. G., "the alcoholic 'demon' been long enough let loose amongst the people? Yet even now the majority of the medical profession do not advocate, but rather oppose, any legislation which will close the several avenues through which this drug is made an article of commerce, rather than a remedy to be prescribed by the physician." The time will never come when either the medical profession or the public will sanction alcoholic liquors being placed on the same footing as opium and other drugs, properly so called. Such a consensus of opinion as would lead to the adoption of that suggestion is not at all likely to happen, as the taste for alcoholic beverages, in some form or other, is too deeply rooted in human nature to admit of their becoming universally restricted to medicinal purposes. But on the other hand the medical profession would gladly see much greater restriction put upon the sale of alcoholic drinks than that which now obtains, for no class of people see more of the physical and moral evils of intemperance than they do. Consequently we hail with pleasure the movement that is now going on in favour of establishing "coffee taverns" for the people, and think that too many inducements cannot be held out to wean the working classes from the public house.

Academie de Medecine.

It is seldom that an election is disputed so warmly as that for the place in the section of hygiene and legal medicine left vacant by the death of Prof. Tardieu. There were seven candidates, but the contest lay between MM. Gallard and Proust, who were placed *ex æquo* on the first line of the list sent up by the committee. At the first ballot they polled equal numbers; at the second, M. Proust obtained thirty-seven to M. Gallard's thirty-six votes; and at the third, when the other candidates were eliminated, M. Proust received forty-six votes and M. Gallard thirty-three.

Arsenical Paper Poisoning.

On more than one occasion we have mentioned the various domestic sources of chronic poisoning by arsenic, but lately the *Sanitary Record* has discovered a fresh one where few would have expected to find one:—"The use of paper collars and cuffs becoming so general, and the great competition in trade, has induced some manufacturers to introduce arsenic into the dressing used to produce that beautiful gloss which seems peculiar to one make of collars, I was induced to analyse some, because a patient of mine had every symptom of arsenical poisoning, and the result was that I obtained 10·4 grains of arsenic in one collar."

Excision of Chancres.

Dr. Auspitz, of the Polyklinik, has tersely and clearly given the results of his experiments on the excision of hard chancres. Of thirty-four cases operated upon, thirty-two remained under observation, and of these thirty-two, eighteen healed without any hardness, and the remaining fourteen healed with hard bases. In three of the thirty-two cases roseola and other general symptoms were present before the operation; two other cases did not remain long enough under observation, and four others exhibited a dubious result. Of the remaining twenty-three, there were fourteen which healed without any hardness and no constitutional symptoms were exhibited up to the time of the last observation; the period of observation varied from four months to twenty. Of the nine cases in which hard bases were left, two showed very slight constitutional symptoms, while the rest showed well-marked constitutional symptoms. Less fully carried out experiments have also been made by Dr. Unna and Dr. Kölliker, and these have shown similar results.

At the meeting of the Select Committee on the Medical Acts Amendment Bill yesterday, the evidence of Dr. Waters, Chairman of the Reform Committee of the British Medical Association, was taken.

We are informed that an examination of candidates for commissions in the British Medical Service, will be held at the University of London, Burlington Gardens, in August next, the date of which will be announced hereafter.

Dr. von Nussbaum, the eminent Professor of Clinical Surgery in Munich, some days ago met with an accident, by which he fractured the external condyle of his left tibia. He has been obliged to transfer his duties as teacher to a deputy.

At the annual meeting of the Society of Arts, held on Wednesday last, the Council announced in their report that they had awarded a silver medal to Mr. Alfred Haviland for his paper on the "Distribution of Diseases Geographically Considered."

The Duchess of Edinburgh has consented to open a bazaar, which will be held on the 1st and 2nd of July, at the Cannon Street Hotel, in aid of the funds for furnishing the new wards for in-patients at the North Eastern Hospital for Children, Hackney.

The rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 34, Madras 33; Paris 25; Geneva 19; Brussels 31; Amsterdam 20, Rotterdam 29; The Hague 26; Copenhagen 26; Christiania 22; St. Petersburgh 39; Berlin 27, Hamburg 28, Dresden 27, Breslau 29, Vienna 30, Buda-Pesth 46, Rome 26, Naples 31, Turin 28, Alexandria 40; New York 24 per 1,000 of the populations. Small-pox caused 26 deaths in St. Petersburgh.

Digitized by Google

The rates of mortality per 1,000 last week in the principal large towns of the United Kingdom, were—Plymouth 11, Oldham 11, Portsmouth 11, Nottingham 12, Leicester 14, Leeds 15, Bristol 16, Brighton 16, Birmingham 17, Wolverhampton 17, Sheffield 18, Sunderland 18, London 19, Salford 19, Liverpool 19, Bradford 20, Glasgow 20, Bradford 20, Hull 22, Newcastle-upon-Tyne 22, Norwich 22, Edinburgh 23, Manchester 25, Dublin 39, including 91 deaths that occurred during the first five months of the year.

The death-rates from the seven principal zymotic diseases last week, averaged 2·7 per 1,000 in the large towns, and ranged from 0·0 in Wolverhampton, and 0·4 in Portsmouth and Leicester, to 3·8 in Salford and 3·9 in Hull. Scarlet fever showed the largest proportional fatality in Salford, Bradford, Hull, and Sunderland; all the 5 fatal cases in Hull occurred in one house, and were of children aged between six months and seven years. Measles caused 104 deaths in London, and only 25 in the nineteen large provincial towns. Three deaths were referred to diphtheria in Manchester, and 3 to enteric fever in Hull. Small-pox caused 12 more deaths in London, 6 in Dublin, but not one in any of the other large towns.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Health of Edinburgh.—The mortality of Edinburgh for the week ending June 21st, shows a decided increase over the preceding week. The deaths amounted to 98, which gives a rate of mortality of 23 per 1,000. There were two solitary deaths from fever and small-pox—that from fever in the Old Town; the other from small-pox in the New. The infection of the latter was traced to an imported case.

Anderson's College, Glasgow.—The annual meeting of the Trustees of Anderson's College, was held in the library of the College on the 23rd June, Mr. J. L. K. Jamieson, president, in the chair. After reading the minutes of last meeting of trustees, and the monthly meetings of the managers, Mr. J. B. Kidston, secretary, gave in the Report of the classes. Mr. Kidston stated that the total number of students attending the College during the year was 2,018, as against 1,784 in the printed list. The vacancies in the list of trustees and managers were filled up, and the present professors' appointments were confirmed.

Death-Rate of Glasgow.—The deaths in Glasgow for the past week were at the rate of 20 per 1,000 per annum, against 19 in the preceding week, and 26, 21, and 22 in the corresponding periods of 1876, 1877, and 1878. The city is therefore in a remarkably healthy state.

Registrar-General's Returns.—The weekly return of births, deaths, and marriages in the eight principal towns in Scotland for the week ending Saturday, June 21st, says, the death-rate in the eight principal towns during the week ending with Saturday, the 21st June, 1879, was 20·6 per 1,000 of estimated population. This rate is 2·9 under that for the corresponding week of last year, and 0·2 above that for the previous week of the present year. The lowest mortality was recorded in Aberdeen, viz., 12·3, and the highest in Leith, viz., 31·9. The death-rate from the seven most familiar zymotic diseases was 3·0 per 1,000. Measles and whooping-cough were the leading epidemics. A male child (imperfectly vaccinated), æt. 8 years and 11 months, died in Edinburgh from small-pox. 104 deaths resulted from acute diseases of the chest, being 7 more than during the previous week.

The Morison Lectures on Insanity.—Dr. Gairdner concluded, last week, his "Morison Lectures" on Insanity. The lectures bore evidence of thought, and were in the main interesting, though certainly rambling and verbose. The lectures were well attended by laymen. Lord Deas, one of the auditors, is understood to have been the judge, who complained, when the lectures were half way through, that the audience had not yet got the promised definition of insanity. The defect was supplied in the last lecture, but with the warning that there could be no exact definition of what was, after all, only a matter of degree. The newspapers seem to have an unfortunate propensity to misquote Dr. Gairdner, and consequently he was obliged to correct the first definition of insanity given by them as his. It now stands thus:—An habitual aberration of the intellect or of the judgment, or an habitual and confirmed want of control over the conduct, such as to diminish or destroy moral responsibility, or to affect the capacity of the individual for the management and disposition of affairs; or, finally, such as to render some degree of control over the person necessary, in the interests either of the individual affected or of society."

Conviction of Medical Students.—It is again our painful duty to record the conviction of three students at the Edinburgh Police Court last week, on a charge of riotous and disorderly conduct. The defendants were William Nicolson, James Milne, and Alfred Honeywell, who pleaded "not guilty." In defence, their solicitor argued that they were victims of the disturbance rather than the creators of it, and several students were called in support of this plea. The evidence, however, of the police was definite, and they were backed by the magistrate, who remarked that he had on more than one occasion observed them, during an epidemic outburst of zeal, which was neither good for themselves nor the public, parading the streets in large bodies, forcing everybody to make room for them, and behaving in a very disorderly manner, even to acts of ungallantry to ladies. He therefore imposed a fine of £5 each, with £5 bail for future good behaviour, or the alternative of twenty days' imprisonment.

Correspondence.

FEES TO MEDICAL WITNESSES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—As the circuits have been announced, I beg to call attention to a flagrant injustice imposed on the medical profession by an arbitrary order of the judges and attorney-general. I allude to a rule by which medical men subpœnaed as witnesses for the Crown are allowed only a maximum fee of two guineas a day, irrespective of distance, with bare railway or other travelling fare, and fifteen shillings for hotel expenses.

Last winter, during severe frost and snow, I was brought to Waterford as witness in an assault case which I had first seen as an act of pure charity. I was labouring under a cold and unfit to leave home. After losing two days, I was shown the printed order, by which the Crown solicitor was restricted to allowing two guineas a day, with the bare travelling and hotel expenses above mentioned.

Dr. Palmer, of Armagh, wrote me word that he was brought from Armagh to Belfast on the same terms, at the same winter assizes. The case occupied several days. Urgent duties obliged him to return home each evening, and re-

Digitized by Google

appear at the opening of the court each morning. For a journey of one hundred miles each day *in such weather*, he could only obtain two guineas a day and the fare of *one journey*.

Had I been brought to Belfast or Londonderry I should have received the same compensation as for going to Waterford. In fact, only the same as a medical man brought in some ten or twelve miles from the country. It is not thus barristers are treated when employed on public duty. *Why should not we meet even-handed justice?*

The consequences of an enforced absence from his field of duty are much more serious to a practising doctor than to any other man. His possible losses cannot be estimated. It is not the fees of the day or of the hour alone which are to be calculated. He may lose for ever professional connections of inestimable value. His status in his sphere of practice may be injured, and irretrievable losses may extend into an indefinite future.

I trust the Irish Medical Association will apply their energies to this great and palpable injustice, an injustice the more flagrant because the injury inflicted is unusually severe.

I am, &c.,

ZACH. JOHNSON, A.M., T.C.D., F.R.C.S., &c.

Kilkenny, June 18th, 1879.

SUPERANNUATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have sometimes noticed in your much-esteemed medical journal communications commenting upon the unsettled state of the superannuation of poor-law medical officers. The old adage, "The nearer my purse, the nearer my heart," applies forcibly to this question.

Now, I think no one would have the hardihood to deny that the present mode of administering superannuation is decidedly objectionable and unsatisfactory; and that being so, I might justly ask, how is it that such an influential body as the dispensary medical officers of Ireland have not this important question settled and sure? At present it is a very great shame to see numbers of medical men, old and hoary in the poor-law harness, working like slaves (for it is nothing short of slavery in most dispensary districts), without a guarantee of one farthing retiring allowance. As to how the work is performed by these gentlemen belongs entirely to another topic. One might say they should resign. Of course they should, and go—where? to the workhouse, if you like. There are numerous districts in Ireland where the dispensary officer does not make over fifty pounds annually from private practice, and this, added to the salary from his appointments, make about the sum of one hundred and sixty pounds. Deduct from this the cost of his man and trap and house rent, and we have the large sum of about eighty pounds for himself and family to live upon. Besides, he is expected to be very charitable. Now, sir, this is the very man who is called upon to retire into private life after his days of usefulness are over, and to live upon his amassed wealth, for wealthy he must be.

Let us ask the question, what arguments could be raised against a non-contingent superannuation? Is it because we are not educated? Is it because our work is light and our appointment a sinecure? Is it because we have no responsibility? Is it because we are worthless members of society and not at all useful? The answer is, certainly not. Well then, I think no body of men ever had a better case, and why stand we all the day idle? We have seen how certain grievances of other professional gentlemen have of late occupied public attention, but I assert that our claims in this matter are paramount to all others.

As to the remedy for this grievance, I shall not say a word, but leave it to the hands of more competent gentlemen.

Should these few suggestions be the means of causing the subject to be taken up and successfully dealt with, the effect would be to make glad the hearts of many. For I can well imagine with what comfort we all would discharge our dispensary duties, if, after a certain servitude, or disabled through declining health, we were satisfied that a living was before us in the evening of our days. *Longius non progrediar.*

I am, &c,

HUGH MCHARRY, Medical Officer.

Belfast Dispensary, June 19th, 1879.

LATRINE ACCOMMODATION FOR WOMEN AND CHILDREN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I am pleased to see, from your last issue, that Dr. James Stevenson, Medical Officer of Health for Paddington, has given his attention to a letter from the Ladies Sanitary Association regarding the "wants" of females in particular, in London and our large provincial towns. The subject is one of most important consideration, and requires to be handled with great delicacy and tact, of which I am sure Dr. Stevenson is capable. The Ladies Sanitary Association, some months back, addressed themselves to the Marylebone Vestry Board, for assistance on the subject of latrines. The letter was referred to the Sanitary Committee, myself in particular as the medical member, and I made several suggestions "how to begin" to solve the difficulty, which appeared feasible, also recommending an answer to be sent to the Ladies Committee, requesting further communication from them on certain points. I regret to say we have not again heard from them, though months have passed since they were written to. The Vestry Sanitary Committees of this parish are most willing and anxious to give every support in the matter, that I beg to assure the ladies of.

It is nearly fifteen years since I mooted the question myself in several journals, but no one seemed inclined to act with me regarding urinals and street private latrines. It must come to an action before long, and I shall be pleased to consult with any medical health officer on that business.

I am, Sir, &c.,

J. MCGRIGOR CROFT, M.D., M.R.C.P.,
Late Staff Surgeon to H.M.'s Royal Army and Hospitals, Guardian and Vestryman of the Parish of Marylebone.

Mandarin Villa, St. John's Wood,
June 25th, 1879.

THE INJECTION OF HOT WATER IN POST-PARTUM HÆMORRHAGE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The above subject being still in its infancy—and to Dr. Atthill, of Dublin, is due the credit of having first given it the initiative in the treatment of post-partum hæmorrhage—I consider it a duty to him, as well as to the profession generally, to record the facts of a case which came under my observation in the month of April last, where every means hitherto used in the arresting of post-partum hæmorrhage failed, and as a last resource, the injection of hot water was resorted to, with, as the result proved, the most signal success.

The facts are these:—I was summoned, on the morning of the 26th April, to attend a lady taken ill in her third confinement. She gave birth to her first child (a son) abroad about ten years ago, and, as far as I can learn, the labour was natural. I attended her on the 15th January, 1877, when she gave birth to a second son, the labour being tedious, but normal in every respect. She again became pregnant in March, 1878, but aborted in two months, which was followed by considerable hæmorrhage, yielding, however, readily to styptics and rest. She again conceived in June, from which period to the above time she enjoyed excellent health. On my arrival at 11 a.m. I found, on examination, the presentation natural, and labour progressing most favourably, and which terminated in an hour by her giving birth to a large, well-developed, male child. The placenta came away in ten minutes, after which there was then firm contraction. In the meantime I gave a drachm of Long's ext. of ergot, with 30 m. of Batley, and applied the binder. Thus far there was no symptom present to indicate the approach of hæmorrhage; the pulse fell to 76 after delivery, and remained so; the countenance was placid, and she exhibited none of that restlessness and nervous excitement, which symptoms usually precede the invasion of an attack of post-partum hæmorrhage.

Having sat by the patient's bed-side for three-quarters of an hour, examining the napkins consecutively every ten minutes, I was about to take my departure, feeling satisfied that all was right, when she informed me there was "something coming," whereupon I again examined, and found her in a pool of blood. I forthwith opened the binder, and upon placing my hand over the uterus found it greatly distended,

Digitized by Google

irregular in shape, flabby, and tilted upwards and forwards. Having emptied it of its contents I endeavoured to excite contraction by cold applications, &c., and, further, gave two drachms of ergot, with half-a-drachm of Batley. These failing, I again pressed away all clots, and injected 4 oz. liq. fer. per. fort. diluted in 6 oz. cold water, with Higginson's syringe, passing the pipe well up to the fundus. I was now hopeful that the hæmorrhage was effectually checked, having ceased for some minutes, but to my chagrin it once more set in, coming away in a continuous bright-red stream. On examining the uterus I found it exactly in the same condition as before—immensely distended, doughy, irregular in contraction, and exceedingly tender to the slightest pressure.

It now became manifest that matters were assuming their worst proportions, and I resolved to give Dr. Atthill's hot water treatment a trial, with the following result.

Having administered what stimulants, &c., I considered necessary, and my patient having plucked up a bit, I for the last time emptied the uterus of its contents, and injected slowly and gently about a gallon and a-half of hot water, temp. 96°, with my right hand, supporting the uterus with the left. The water returned greatly discoloured for some time, which disheartened me not a little; however, it gradually became clearer and clearer, until one-half of the quantity finally returned as injected.

The uterus now contracted firmly and evenly; the patient expressed herself greatly relieved and comfortable from the soothing effects of the warmth to the uterus. It was with some slight difficulty I removed the pipe, which was firmly grasped by the cervix and the vaginal walls.

Hoping, Mr. Editor, that you will consider the above humble statement worthy of insertion in your highly-influential journal,

I am, Sir,

Your obedient servant,

CHAS. G. LYSTER.

Kilkenny, June 12, 1879.

CROUP AND DIPHTHERIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—There is no disputing the fact that by logic one can prove almost anything, however preposterous or absurd, should the principles of right and wrong not have been taken into serious account. *Apropos* of this, who has not heard of the famous syllogism:—A mouse is a mono-syllable; but a mouse knaws, therefore a mono-syllable knaws. That Dr. Semple is an adept in dialectics, there cannot be a doubt; but he will pardon me when I say that he revolves in a kind of vicious circle, and mainly endeavours to entrap his opponent in the same vertex. Dr. Semple freely admits that croup and diphtheria are different, but that laryngo-tracheal diphtheria and the "so-called" membranous croup are identical. This, I affirm, is a distinction without a difference. Dr. Semple imagines that by changing the form of an idea, and clothing it in a new garb, he can strengthen his own position, and baffle, if not disarm, his opponent at the same time. But I would ask seriously, does diphtheria lose its nature and character by the mere fact of its extending to the larynx and trachea? Or, in other words, does it cease to be diphtheria? I maintain that it can no more divest itself of its true name and nature by locality, than can the leopard change his spots. I admit with Dr. Semple that laryngo-tracheal diphtheria is always a membranous croup; but the converse, that a membranous croup is always laryngo-tracheal diphtheria, I do not admit. The terms, in fact, are not convertible. Dr. Semple thinks they are. Herein lies the fallacy to which I alluded, and trust, fully exposed in my previous letter. Then again, if membranous croup be always diphtheritic, why not also comprise other diseases attended by the exudation of false membrane, peritonitis, pleurisy, and pericarditis; for example, in the same category? But more, if membranous croup and diphtheria be one and the same disease, or, to put it more pointedly, if membranous croup be always diphtheritic, why not invariably adopt the same general method of therapeutic treatment as we do when diphtheria attacks other portions of the body? This, I fancy, the most sanguine unicist would not venture to attempt; and by the mere fact of changing his tactics, as regards treatment, he concedes a tacit, yet cogent, acknowledgment of the non-identity of both affections.

Towards the close of his communication, Dr. Semple is emphatic in stating that "there is no difference between the false membrane of laryngeal diphtheria, and that of the so-called croup, the matter being now conclusively settled." This opinion, however, is far from being universally, or even generally, adopted (and, I think, for very substantial reasons) as many, including myself, consider them physically and histologically dissimilar. The false membrane of diphtheria, if examined closely (it does not require a magnifying glass for this purpose) will be found to present numerous red spots and lines, which are not mere blood-stains, being imbedded in its substance, and which are the rudiments, or starting points, of minute blood-vessels, showing, at once, an abortive attempt at organisation, and the intimate connection by which the membrane had been united to the subjacent mucous tissue. This I have never observed in the exudation of true croup. Another fact of considerable importance in relation with this subject is, that tube-casts or cylinders are never thrown off by the expulsive efforts of coughing or vomiting in diphtheria, whereas they are occasionally so in true croup.

Before concluding, I am sorry to have to allude to a matter of a personal nature. Dr. Semple expresses a "doubt whether I have followed the inquiries and discussions that have lately taken place on the subject." Now, why should he think so, I am really at a loss to divine. The only probable reason I can conjecture is, that I differ with him, *toto cælo*, on the topic under consideration, but this should be no valid pretext for condemning me so hastily as he does. Surely, Dr. Semple would not feel flattered, much less complimented, were I to say that he only followed the inquiries and debate in so far as professional opinion happened to chime in with his own peculiar views, and yet the assertion, had I given utterance to it, would not be a whit more gratuitous and uncalled for than the one in question. I regret very much that I cannot agree with him; but he will believe me when I say that this arises from no factious spirit of opposition, but rather from a firm, deep-rooted conviction that my views of the subject are right, and that his are wrong. I must thank him, however, for kindly referring me to his own writings and papers, as also to the published Report of the Committee on Membranous Croup and Diphtheria, which I have not as yet seen.

I am, &c.,

BERNARD KELLY, M.D.

Rotherhithe, S.E., June 26th, 1879.

THE FLORENTINE ACADEMY OF MEDICINE, AND THE CROUP AND DIPHTHERIA QUESTION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As the resolutions passed by the Florentine physicians after a careful study of a most terrible visitation of diphtheria in and about Florence from 1860 to 1870 are of great importance, I think it only right to quote the exact words in which the chief resolution is framed.—"La massima parte de'fatti che si riferiscono alle passate epidemie non che quelli raccolti nel corso della epidemia attuale dimostrano che la forma crouposa e la forma difterica si consociano e si succedono in maniera da apparire come fasi e modalità in ragione di tempo e di sede d'uno stesso processo morboso."

Now Dr. Prosser James understands Italian as well as I do, and I would ask him or any other Italian scholar whether the above passage represents croup and diphtheria as two different diseases? It clearly states that the *croupous form* and the *diphtheric form* of disease are so mixed up together that they appear to be only *phases and modifications of one and the same morbid process.* Dr. James candidly admits that he quotes from memory, and I have the actual passage before me, and he must admit, I think, that his memory has been treacherous.

The other point referred to by Dr. James in reference to what is called "primitive croup," is discussed and decided with equal clearness, and I can assure him that the question as laid down in the Italian Report is, "whether there exists a true, primitive, laryngo-tracheal and localised croup?" and the Academy decided that "the occurrence of this primitive, pseudo-membranous croup is very rare, but that it does exist." Its existence, as Dr. James well knows, was fully recognised by Bretonneau, and it is described in all modern French books on diphtheria as the "croup d'emblée."

I am, &c.,

R. H. SEMPLE, M.D., F.R.C.P.I.

8 Torrington Square, June 28th, 1879.

London: Blackie and Son, 49 and 50 Old Bailey, E.C. 1879.

1. Dr. Shoemaker's papers are of a useful and practical nature, and the one on Rosacea we can especially recommend to all interested in dermatology.

2. We all know the dangers of our sewers, and if we do not know them, in the face of the work recently published by T. Pridgen Teale, F.R.C.S., the blame must rest on our own indifference to health.

It is easier, perhaps, to point out an evil than to suggest a remedy. But we have remedies without end. Innumerable patents have been taken out, professing to solve the problem of keeping our houses healthy, by preventing the entrance of sewer gas. A large number of these patents have been lamentable failures, householders have been deceived, for they have proved "delusions and snares."

To Leeds we are indebted for a Pictorial Guide to Sanitary Defects; to Leeds we are again indebted for a pictorial guide to remedy these defects. Upon the first work we were able to pronounce an unequivocal opinion, as a success. Upon the second work by Mr. Copley Woodhead, we are not in a position to give a similar verdict, though we may allow the author to set forth his own claims.

In the preface he tells us that he was induced to study the subject, as some years ago the whole of his numerous family (eleven) were severely attacked with a disease of a zymotic class, and that, after many experiments, he devised a simple scheme by which sewer gas may be prevented from entering a house. He next passes in review the formation of sewer gas, and raises some very grave objections, against water-valves or ordinary syphon traps placed outside a house, against gully-traps, and traps placed inside a house, against bell-traps, against the junction of house-drains with one's neighbours', and against the use of tubes and pipes carried to the eaves of houses and buildings, into the flues of chimneys or otherwise, intended to ventilate house-drains and main sewers. In reference to Stott's system, he says:—"It has also been proposed to ventilate our sewers into factory chimneys or furnaces, but this mode can never, at any time, be efficient. Because of the numerous openings into sewers and drains, the air would, in this instance, be drawn in at the first opening nearest the chimney or furnace, and the rest of the sewers and drains would still remain full of sewer air."

After some further objections, we have at p. 27 an elaborate explanation of the author's system, which is too long to introduce here, and which could not be understood without the excellent explanatory diagrams accompanying it. We must consequently refer our readers to Mr. Woodhead's pamphlet, the price of which is only two shillings. His plan comes well-recommended, and he is able to bring forward a number of practical testimonials to its efficacy, from householders who have tried it—amongst whom we may mention Marshall and Snelgrove, and Claudius J. Wheelhouse, Esq., F.R.C.S., Leeds—and from architects who have approved of his theoretical explanations.

3. This unpretending little volume is particularly designed for the use of the American medical student. More attention has been directed to the chemistry of therapeutics than to that of pharmacy, and physiological chemistry has been specially dealt with. The whole work is arranged in a series of questions and answers which are, in general, clear and succinct. In a small work of some two hundred pages, it would be unreasonable to expect any thorough exposition of the subject with which Dr. Wilthaus deals, but it is possible that the student may find it of some assistance in refreshing his memory after studying larger manuals.

4. This book is designed to aid the student in acquiring a practical knowledge of botany. Two charts of the natural orders are given, in which the distinguishing characters of the plants are reduced to a minimum, and as the pronunciation of botanical terms is acknowledged to be by no means uniform, the accentuation of both the English terms and the Latin words from which they are derived, is given. A list of the plants most easily obtained during each month in the year, and which will best illustrate the various types and peculiarities of each natural order is added, so that the student may study those plants which flower in the winter, autumn and spring, but cannot be obtained during the usual botanical course, viz., from May to July. The work commences with two diagrams, showing the parts of flowering plants. These diagrams are next explained, then directions are given for the examination of plants microscopically and otherwise. We can heartily recommend Mr. Holme's Note Book, and feel confident that it will prove invaluable to the industrious student in botany.

5. In the present volume, the general principles of organic chemistry are discussed; thus we have the distinctions between organic and inorganic substances; organic analysis and empirical formulæ; the methods for determining the rational formulæ of organic substances; the estimation of nitrogen, the halogens, sulphur, arsenic and phosphorus in organic matter; organic substitution; the theory of compound organic radicals; the hydrides of organic radicals; the distillation of coal; the alcohols; the ethers; the aldehydes; organic acids; the anhydrides; the alkaloids or organic bases; organo-metallic compounds; identification of organic substances; oils, fixed and essential, &c. The book terminates with a description of the apparatus needed in determining the subjects discussed in its earlier pages, and a number of exercises are appended, together with numerous papers set at the examinations of the Science and Art Department, with answers, from 1868 to 1878.

The author has evidently bestowed considerable pains upon his undertaking, and it is probable that the student aspiring for honours may derive valuable assistance from a perusal of Mr. Clement's Manual, but to the ordinary run of students, we are afraid the work will prove of little or no advantage.

Medical News.

Royal College of Surgeons of England. — The following having passed the required examination received the diploma in Dental Surgery at the last meetings of the Board of Examiners:—H. J. Alexander, C. N. Brameld, V. G. Carranza, W. H. Chalcraft, S. Cook, W. G. Daish, E. L. Dudley, C. King, J. H. M'Call, F. H. Newton, S. W. Nunn, J. L. F. J. Pike, D. M. Small, F. J. Thorman, W. G. Weiss. Two candidates failed to satisfy the Board, and were referred for six months.

Queen's University in Ireland.—At a meeting of the University held on the 23rd June the following degrees were conferred by the Vice-Chancellor, Sir Dominic J. Corrigan, Bart., M.D.:—

Doctor in Medicine.—Wm. James Cowden, Joseph Crowley, Thomas Dorman, Thomas P. Madden, Chas. Magill, Robert Mitchell, Alexander Sharpe, Jacob Thos. Shipsey, John Simpson, William Smyth, Horace R. Townsend, James Wilson, Wm. Mussen Young.

Master in Surgery.—Joseph Crowley, Thomas Dorman, A. Oswald Geoghegan, Gilbert Kirker, Thos. P. Madden, Charles Magill, John M'Kinlay, Robert Mitchell, Alexander Sharpe, Jacob Thos. Shipsey, John F. Tuohy.

Diploma in Midwifery.—Joseph Crowley, Gilbert Kirker, Daniel Riordan, John Simpson, William Smyth, Horace R. Townsend, John Wilson.

Prejudicial Action of Chlorate of Potash.

In a paper read before the Medical Society of the State of New York, Dr. Jacobi calls attention to what he considers the dangers of large doses of this medicine. The dose for a child two or three years old, should not be larger than half-a-drachm in twenty-four hours. He is convinced that large and repeated doses of this drug have proved "dangerous and even fatal in a number of instances, producing one of the most dangerous diseases—acute nephritis." We have not had much experience of very large doses of chlorate of potash, but there may be some truth in Dr. Jacobi's statement, and, at all events, it will be as well to bear it in mind.

On the Prevention of Fatal Accidents from Using Anæsthetics.

Dr. Simonin gives, in the *Revue Méd. de l'Est*, 5 année t. x, No. 9, p. 263, the following three observations, which may be considered as very important if attended to.

1. Progressive peripheric insensibility, especially in the temporal region and the cornea.

2. The condition of the muscles and the jaws; the former must be in a complete state of relaxation, and the jaws closed. The adductor muscles of the lower jaw, therefore, form an exception to the rule, by being in a state of trismus.

3. The state of the pupil, which must be contracted, while the respiration becomes more normal, having been much quickened during the stage of excitement. All these phenomena are very important; they are synchronous, and must be carefully observed, as well as respiration and circulation.

If the three symptoms cited should not appear coincidently, they must be carefully watched for in various stages of the anæsthesia, because they are sure to appear at a given moment.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Mr. W. T. Walters.—The next examination for commissions in the Army Medical Service will be held at the University of London in August next. We understand the exact dates are not yet fixed, but if you watch our advertising columns during July you will be able to obtain the necessary information.

Mr. J. Stone.—We can only give you the same answer.

Pater.—Gant's, Bryant's, or Erichsen's "Surgerys" are the best; the first-named is probably the most complete, more particularly in special subjects.

Dr. C. S. Davis, New York.—We cannot further increase our Exchange List, it is already too extensive for adequate service, and the "Index Medicus" answers every purpose in the direction of which you speak.

HYDROPHOBIA IN LANCASHIRE.

To the Editor of the Medical Press and Circular.

Sir,—John Milner was not under my care, I merely saw him upon the invitation of one of the practitioners who attended. I believe no line of treatment was, or could have been, adopted in his case, as his parents having first summoned several medical men independently to see him, then removed him into the country to be beyond medical interference. My assistant who saw him is not qualified (from pecuniary reasons), but has been fifteen years in the profession, ten of the fifteen with me, and was acting under my specific instructions."

Yours, &c.,

John Holden, M.R.C.S.

[This letter affords an excellent instance of the prevalent feeling about the uselessness of attempting to cope with hydrophobia, and as we see, it extended both to doctor and patient's friends. It also shows how difficult it is to deal with the question of unqualified assistants. We have always advocated the importance and necessity of employing qualified men as assistants, and we need not now reopen the subject. We would recommend to Mr. Holden a small pamphlet by Dr. Offenberg—"Gcherite Hundswuth beim Menschen."—Ed.]

Dr. C. B.—We object to make our columns the record of Dr. George Beaney's "munificent gifts," his dinners, or his doings. Our correspondent not being "behind the scenes" is of course unaware of the nature of the communications we are constantly receiving from Melbourne, both in public journals and private letters.

Dr. David McEniry.—Your letter will appear in our next.

Anxious.—The preparation is not a patented one, you can get it made up at any first-class chemists.

Mr. D. L. E.—A review of your book is in type awaiting space for insertion.

Dr. J. A. H.—With pleasure.

M. Betagh.—No dates were given by our correspondent as to the length of time the poison remained latent in the bitten children before its effect showed itself. The point is important, and we will endeavour to ascertain.

G. A. O.—To receive fees, under any circumstances, from, or on behalf of, a dispensary patient, is directly contrary to the regulations, and renders the recipient liable to dismissal. A present given after treatment had terminated might, perhaps, be accepted, if not demanded or suggested by the doctor.

VACANCIES.

Ballycastle Union, Croagh Dispensary.—Medical Officer. Salary, £100, with fees, and £20 as Sanitary Officer. Election, July 11.

Birmingham, Children's Hospital.—Non-Resident Surgeon. Daily attendance required. Salary, £60, with partial board. Applications to the Medical Board.

Brecon Infirmary.—Resident House Surgeon. Salary commencing at £120. Applications to the Secretary on or before July 10.

Dudley, the Guest Hospital.—Resident Medical Officer. Salary, £120, with board. Applications to the Secretary on or before July 7.

Dundalk Union, Carlingford Dispensary.—Medical Officer. Salary, £100, with fees, and £25 as Sanitary Officer. Election, July 10.

Dunfanagha Union, Falcaragh Dispensary.—Medical Officer. Salary, £100, with fees, and £10 as Sanitary Officer. Election, July 16.

Hospital for Women, Soho Square, London.—Assistant Physician and a House Physician. Full particulars of the Secretary.

Narberth Union.—Medical Officer for No. 2 District. Salary, £35, with £10 as Medical Officer, and the usual fees. Applications to the Clerk before July 19.

Oldcastle Union, Crossakiel Dispensary.—Medical Officer. Salary, £120, with fees, and £15 as Sanitary Officer. Election, July 11.

Shillelagh Union, Coolattin and Clonegal Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, July 11.

Shillelagh Union Workhouse.—Medical Officer. Salary, £90, and £10 as Consulting Sanitary Officer. Election, July 11.

Wilts County Lunatic Asylum.—Assistant Medical Officer. Salary, £110, with board. Applications to Dr. Cooke, at the Asylum, Devizes.

APPOINTMENTS.

Alford, C. E., M.R.C.S.E., Medical Officer and Public Vaccinator for the No. 7 District of the Yeovil Union.

Bastable, D. H., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer for the Rosliston District of the Burton-on-Trent Union.

Blake, R. M., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer for the Ravensdale Dispensary District of the Dundalk Union, co. Louth.

Bleakley, A. S., M.B., M.Ch. Univ. Dub., Medical Officer to the Blessington Dispensary, Naas Union.

Dalies, J., M.R.C.S.E., Medical Officer for the No. 2 District of the Bath Union.

Dudgeon, J. M., M.B., C.M., Medical Officer and Public Vaccinator for the Parish of Comrie, Perthshire.

Graham, A., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for the Parish of Currie, Edinburghshire.

Juler, H. E., F.R.C.S.E., Demonstrator of Anatomy at St. Mary's Hospital Medical School.

Ryan, Dr., Medical Officer to the Oulert Dispensary, Enniscorthy Union.

Stafford, T. E., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the West Deeping District of the Stamford Union.

Deaths.

Atkinson.—On June 18, at the Queenstown General Hospital, Henry Seymour Atkinson, L.S.A.L., the Resident Medical Officer, aged 27.

Baxter.—On June 16, at Dundee, Peter M. Baxter, L.R.C.S.Ed.

Chorley.—On June 21, at Maghull, Liverpool, Marmaduke Wilmer Watkins Chorley, M.R.C.S.E., aged 83.

Goodall.—On June 15, at Bournemouth, Alexander Goodall, M.D., Staff-Surgeon R.N., aged 39.

Gray.—On June 18, at Kirkcaldy, Fifeshire, Andrew Gray, L.R.C.S.Ed., aged 60.

Hemsted.—On June 12, at Bath, Henry Hemsted, F.R.C.S.E., late of Speenhamland, Berks, aged 72.

Hooper.—On June 14, at Staunton, Worcestershire, Thomas Hooper, Surgeon, aged 84.

Lochrane.—On June 21, at Middletown, co. Armagh, Jane, the wife of Edward Lochrane, L.R.C.S.Ed., aged 79.

Moffatt.—On June 22, at Kelvingrove Street, Glasgow, Robt. Moffatt, M.D., aged 24.

Snowden.—On June 16, at Gateshead, John P. Snowden, M.R.C.S.E., aged 38.

Treharne.—On June 20, at Bournemouth, John Treharne, M.B., C.M., B.Sc.Ed., aged 32.

Whitla.—On June 26, at Monaghan, James Whitla, L.A.H., aged 35.

Wood.—On June 10, at Shrewsbury, Samuel Wood, F.R.C.S.E., F.S.A., Consulting Surgeon to the Salop Infirmary, aged 67.

Wylie.—On June 16, at Errol, Perthshire, James Wylie, L.R.C.P.Ed., aged 69.

THE DIPHTHERIA OUTBREAK OF LAST SPRING IN N.W. LONDON. (a)

By T. MORTON, M.D. Lond., &c.

The outbreak of diphtheria to which I wish to call your attention presented some features of unusual interest, and through the official inquiry of which it was the subject, it has been the means of securing at least one important addition to our knowledge of the disease, and putting us upon a new track, which may not improbably lead to further and still more important discoveries.

Mr. W. H. Power's Report of his inquiry made for the Local Government Board, to which I have just referred, is of so recent a date, and attracted so much attention at the time of its publication in December last, that much of what I have to say, being necessarily a reproduction of the Report, will be already familiar to many of my hearers. I have reason to believe, however, that, widely as Mr. Power's conclusions have been noticed, comparatively few have actually read his Report, or are in a position to appreciate the facts upon which his conclusions are based, or the steps by which they were reached.

My principal object will be to place you in this position, by narrating unofficially the history of the epidemic (of which I happened to see a good deal), and enabling you to follow and criticise the lines of thought along which Mr. Power was led by the facts which he so industriously collected.

This will necessarily raise the whole question of the etiology of diphtheria, upon which, together with the allied subjects of its prevention, and its relation to other diseases, I hope a really useful discussion may arise.

The map compiled by Mr. Power, which by the courtesy of Her Majesty's Stationery Office I have been able to place in the hands of members, shows, at a glance, one leading feature of the outbreak, its curious limitation in area. 230 out of the whole 264 cases are crowded within a circle of half-a-mile radius, and all, with scarcely an exception, within one of a mile. Those who know the neighbourhood will also recognise how comparatively good a class of dwellings they occurred in, and how remarkable an immunity adjoining districts of really poor houses in Kilburn Park and Portland Town enjoyed.

The outbreak was almost as curiously limited in point of time. The whole 264 cases are comprised within the four months, March, April, May, and June, 1878, but within these four months the four weeks ending June 25th, form, as it were, an inner circle, in which no less than 78 out of the 118 invaded households were first attacked, and no less than 46 of these households, including 111 persons, in one week. It was this sudden outburst which first attracted attention to the epidemic, and, but for it, the much larger aggregate of cases spread over the other weeks would probably never have been dragged to light and brought into focus. Finding towards the end of May that I had under treatment at one and the same time 25 cases of a disease of which for years I never saw an example, and of which even of late years it was rare to see above two or three in a year, I wrote to the Local Government Board suggesting an inquiry. Others did the same, and at last, and only, I believe, then through the personal intervention of Professor Huxley, whose household was attacked, and who happened to be a friend of Mr. Sclater-Booth's, Mr. Power was set to work, and his inquiries resulted in bringing to light 264 cases in 118 households, grouped in point of place as shown on the map, and in point of time as follows:—

In the first week, ending March 9th, two persons in two households.

THE DIPHTHERIA OUTBREAK OF LAST SPRING IN N.W. LONDON. (a)

By T. MORTON, M.D. Lond., &c.

The outbreak of diphtheria to which I wish to call your attention presented some features of unusual interest, and though the official inquiry of which it was the subject has been the means of securing at least one important addition to our knowledge of the disease, and putting us upon a new track, which may not improbably lead to later and still more important discoveries.

Mr. W. H. Power's Report of his inquiry made for the Local Government Board, to which I have just referred, [illegible] time, and attracted so much attention at the time of its publication in December last, that much of what I have to say, being necessarily a reproduction of his Report, will be already familiar to many of my hearers. I am [illegible] to believe, however, that, widely as Mr. Power's conclusions have been noticed, comparatively few have actually read his Report, or are in a position to [illegible] the facts upon which his conclusions are based, or the steps by which they were reached.

My principal object will be to place you in this position, by [illegible] the history of the epidemic (of which I happened to see a good deal), and enabling you to follow and estimate the lines of thought along which Mr. Power was led by the facts which he so industriously collected.

We shall incidentally [illegible] the whole question of the [illegible] of diphtheria, upon which, together with the allied subjects of its prevention, and its relation to other diseases, I hope a really useful discussion may arise.

The map compiled by Mr. Power, which by the courtesy of Her Majesty's Stationery Office I have been able to place in the hands of members, shows, at a glance, one leading feature of the outbreak, its curious limitation in area. 230 out of the whole 264 cases are crowded within a circle of half-a-mile radius, and all, with scarcely an exception, within one of a mile. Those who know the neighbourhood will also recognise how comparatively good a class of dwellings they occurred in, and how remarkable an immunity adjoining districts of really poor houses in Kilburn Park and Portland Town enjoyed.

The outbreak was almost as curiously limited in point of time. The whole 264 cases are comprised within the four months, March, April, May, and June, 1878, but within these four months the four weeks ending June 25th, form, as it were, an inner circle, in which no less than 78 out of the 118 invaded households were first attacked, and no less than 46 of these households, including 111 persons, in one week. It was this sudden outburst which first attracted attention to the epidemic, and, but for it, the much larger aggregate of cases spread over the other weeks would probably never have been dragged to light and brought into focus. Finding towards the end of May that I had under treatment at one and the same time 25 cases of a disease of which for years I never saw an example, and of which even of late years it was rare to see above two or three in a year, I wrote to the Local Government Board suggesting an inquiry. Others did the same, and at last, and only, I believe, then through the personal intervention of Professor Huxley, whose household was attacked, and who happened to be a friend of Mr. Sclater-Booth's, Mr. Power was set to work, and his inquiries resulted in bringing to light 264 cases in 118 households, grouped in point of time as shown on the map, and in point of [illegible]

In the first week [illegible] two house[illegible]

irregular in shape, flabby, and tilted upwards and forwards. Having emptied it of its contents I endeavoured to excite contraction by cold applications, &c., and, further, gave two drachms of ergot, with half-a-drachm of Batley. These failing, I again pressed away all clots, and injected 4 oz. liq. fer. per. fort. diluted in 6 oz. cold water, with Higginson's syringe, passing the pipe well up to the fundus. I was now hopeful that the hæmorrhage was effectually checked, having ceased for some minutes, but to my chagrin it once more set in, coming away in a continuous bright-red stream. On examining the uterus I found it exactly in the same condition as before—immensely distended, doughy, irregular in contraction, and exceedingly tender to the slightest pressure.

It now became manifest that matters were assuming their worst proportions, and I resolved to give Dr. Atthill's hot water treatment a trial, with the following result.

Having administered what stimulants, &c., I considered necessary, and my patient having plucked up a bit, I for the last time emptied the uterus of its contents, and injected slowly and gently about a gallon and a-half of hot water, temp. 96°, with my right hand, supporting the uterus with the left. The water returned greatly discoloured for some time, which disheartened me not a little; however, it gradually became clearer and clearer, until one-half of the quantity finally returned as injected.

The uterus now contracted firmly and evenly; the patient expressed herself greatly relieved and comfortable from the soothing effects of the warmth to the uterus. It was with some slight difficulty I removed the pipe, which was firmly grasped by the cervix and the vaginal walls.

Hoping, Mr. Editor, that you will consider the above humble statement worthy of insertion in your highly-influential journal,

I am, Sir,

Your obedient servant,

CHAS. G. LYSTER.

Kilkenny, June 12, 1879.

CROUP AND DIPHTHERIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—There is no disputing the fact that by logic one can prove almost anything, however preposterous or absurd, should the principles of right and wrong not have been taken into serious account. *Apropos* of this, who has not heard of the famous syllogism:—A mouse is a mono-syllable; but a mouse knaws, therefore a mono-syllable knaws. That Dr. Semple is an adept in dialectics, there cannot be a doubt; but he will pardon me when I say that he revolves in a kind of vicious circle, and mainly endeavours to entrap his opponent in the same vertex. Dr. Semple freely admits that croup and diphtheria are different, but that laryngo-tracheal diphtheria and the "so-called" membranous croup are identical. This, I affirm, is a distinction without a difference. Dr. Semple imagines that by changing the form of an idea, and clothing it in a new garb, he can strengthen his own position, and baffle, if not disarm, his opponent at the same time. But I would ask seriously, does diphtheria lose its nature and character by the mere fact of its extending to the larynx and trachea? Or, in other words, does it cease to be diphtheria? I maintain that it can no more divest itself of its true name and nature by locality, than can the leopard change his spots. I admit with Dr. Semple that laryngo-tracheal diphtheria is always a membranous croup; but the converse, that a membranous croup is always laryngo-tracheal diphtheria, I do not admit. The terms, in fact, are not convertible. Dr. Semple thinks they are. Herein lies the fallacy to which I alluded, and trust, fully exposed in my previous letter. Then again, if membranous croup be always diphtheritic, why not also comprise other diseases attended by the exudation of false membrane, peritonitis, pleurisy, and pericarditis; for example, in the same category? But more, if membranous croup and diphtheria be one and the same disease, or, to put it more pointedly, if membranous croup be always diphtheritic, why not invariably adopt the same general method of therapeutic treatment as we do when diphtheria attacks other portions of the body? This, I fancy, the most sanguine unicist would not venture to attempt; and by the mere fact of changing his tactics, as regards treatment, he concedes a tacit, yet cogent, acknowledgment of the non-identity of both affections.

Towards the close of his communication, Dr. Semple is emphatic in stating that "there is no difference between the false membrane of laryngeal diphtheria, and that of the so-called croup, the matter being now conclusively settled." This opinion, however, is far from being universally, or even generally, adopted (and, I think, for very substantial reasons) as many, including myself, consider them physically and histologically dissimilar. The false membrane of diphtheria, if examined closely (it does not require a magnifying glass for this purpose) will be found to present numerous red spots and lines, which are not mere blood-stains, being imbedded in its substance, and which are the rudiments, or starting points, of minute blood-vessels, showing, at once, an abortive attempt at organisation, and the intimate connection by which the membrane had been united to the subjacent mucous tissue. This I have never observed in the exudation of true croup. Another fact of considerable importance in relation with this subject is, that tube-casts or cylinders are never thrown off by the expulsive efforts of coughing or vomiting in diphtheria, whereas they are occasionally so in true croup.

Before concluding, I am sorry to have to allude to a matter of a personal nature. Dr. Semple expresses a "doubt whether I have followed the inquiries and discussions that have lately taken place on the subject." Now, why should he think so, I am really at a loss to divine. The only probable reason I can conjecture is, that I differ with him, *toto cœlo*, on the topic under consideration, but this should be no valid pretext for condemning me so hastily as he does. Surely, Dr. Semple would not feel flattered, much less complimented, were I to say that he only followed the inquiries and debate in so far as professional opinion happened to chime in with his own peculiar views, and yet the assertion, had I given utterance to it, would not be a whit more gratuitous and uncalled for than the one in question. I regret very much that I cannot agree with him; but he will believe me when I say that this arises from no factious spirit of opposition, but rather from a firm, deep-rooted conviction that my views of the subject are right, and that his are wrong. I must thank him, however, for kindly referring me to his own writings and papers, as also to the published Report of the Committee on Membranous Croup and Diphtheria, which I have not as yet seen.

I am, &c.,

BERNARD KELLY, M.D.

Rotherhithe, S.E., June 26th, 1879.

THE FLORENTINE ACADEMY OF MEDICINE, AND THE CROUP AND DIPHTHERIA QUESTION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As the resolutions passed by the Florentine physicians after a careful study of a most terrible visitation of diphtheria in and about Florence from 1860 to 1870 are of great importance, I think it only right to quote the exact words in which the chief resolution is framed.—"La massima parte de'fatti che si riferiscono alle passate epidemie non che quelli raccolti nel corso della epidemia attuale dimostrano che la forma crouposa e la forma difterica si consociano e si succedono in maniera da apparire come fasi e modalità in ragione di tempo e di sede d'uno stesso processo morboso."

Now Dr. Prosser James understands Italian as well as I do, and I would ask him or any other Italian scholar whether the above passage represents croup and diphtheria as two different diseases? It clearly states that the *croupous form* and the *diphtheric form* of disease are so mixed up together that they appear to be only *phases and modifications of one and the same morbid process.* Dr. James candidly admits that he quotes from memory, and I have the actual passage before me, and he must admit, I think, that his memory has been treacherous.

The other point referred to by Dr. James in reference to what is called "primitive croup," is discussed and decided with equal clearness, and I can assure him that the question as laid down in the Italian Report is, "whether there exists a true, primitive, laryngo-tracheal and localised croup?" and the Academy decided that "the occurrence of this primitive, pseudo-membranous croup is very rare, but that it does exist." Its existence, as Dr. James well knows, was fully recognised by Bretonneau, and it is described in all modern French books on diphtheria as the "croup d'emblée."

I am, &c.,

R. H. SEMPLE, M.D., F.R.C.P.I.

8 Torrington Square, June 28th, 1879.

Literature.

SHORT NOTICES.

(1). "Ring-worm in Public Institutions. Rosacea." By John Shoemaker, M.D. Philadelphia: Collins. 1878.

(2). "The Dangers of our Sewers and House-drains." By Copley Woodhead, M.R.C.S. Leeds: Goodall. 1878.

(3). "Essentials of Chemistry, Inorganic and Organic, for the use of Students in Medicine." By R. A. Wilthaus, A.M., M.D., Professor of Chemistry in the Medical Department, University of Vermont; formerly Associate Professor of Chemistry and Physiology in the Medical Department, University of New York; Member of the Chemical Societies of Paris and Berlin, &c. New York: Williams, Wood, and Co. 1879.

(4). "Holmes' Botanical Note Book; or, Practical Guide to a knowledge of Botany." By E. M. Holmes, F.L.S., Curator of the Museum of the Pharmaceutical Society of Great Britain, Late Lecturer on Botany at Westminster Hospital. London: Christy and Co. 1878.

(5). "A Manual of Organic Chemistry, Practical and Theoretical. For Colleges and Schools, Medical and Civil Examinations, and especially for elementary, advanced, and honours students at the classes of the Science and Art Department, South Kensington." By Hugh Clements, of H.M. Civil Service, President of the Amateur Mechanic's Workshops Association, London, and Lecturer on various Sciences at St. Thomas's, Charterhouse, and several other Science Institutions in London. London: Blackie and Son, 49 and 50 Old Bailey, E.C. 1879.

1. Dr. Shoemaker's papers are of a useful and practical nature, and the one on Rosacea we can especially recommend to all interested in dermatology.

2. We all know the dangers of our sewers, and if we do not know them, in the face of the work recently published by T. Pridgen Teale, F.R.C.S., the blame must rest on our own indifference to health.

It is easier, perhaps, to point out an evil than to suggest a remedy. But we have remedies without end. Innumerable patents have been taken out, professing to solve the problem of keeping our houses healthy, by preventing the entrance of sewer gas. A large number of these patents have been lamentable failures, householders have been deceived, for they have proved "delusions and snares."

To Leeds we are indebted for a Pictorial Guide to Sanitary Defects; to Leeds we are again indebted for a pictorial guide to remedy these defects. Upon the first work we were able to pronounce an unequivocal opinion, as a success. Upon the second work by Mr. Copley Woodhead, we are not in a position to give a similar verdict, though we may allow the author to set forth his own claims.

In the preface he tells us that he was induced to study the subject, as some years ago the whole of his numerous family (eleven) were severely attacked with a disease of a zymotic class, and that, after many experiments, he devised a simple scheme by which sewer gas may be prevented from entering a house. He next passes in review the formation of sewer gas, and raises some very grave objections, against water-valves or ordinary syphon traps placed outside a house, against gully-traps, and traps placed inside a house, against bell-traps, against the junction of house-drains with one's neighbours', and against the use of tubes and pipes carried to the eaves of houses and buildings, into the flues of chimneys or otherwise, intended to ventilate house-drains and main sewers. In reference to Stott's system, he says:—"It has also been proposed to ventilate our sewers into factory chimneys or furnaces, but this mode can never, at any time, be efficient. Because of the numerous openings into sewers and drains, the air would, in this instance, be drawn in at the first opening nearest the chimney or furnace, and the rest of the sewers and drains would still remain full of sewer air."

After some further objections, we have at p. 27 an elaborate explanation of the author's system, which is too long to introduce here, and which could not be understood without the excellent explanatory diagrams accompanying it. We must consequently refer our readers to Mr. Woodhead's pamphlet, the price of which is only two shillings. His plan comes well-recommended, and he is able to bring forward a number of practical testimonials to its efficacy, from householders who have tried it—amongst whom we may mention Marshall and Snelgrove, and Claudius J. Wheelhouse, Esq., F.R.C.S., Leeds—and from architects who have approved of his theoretical explanations.

3. This unpretending little volume is particularly designed for the use of the American medical student. More attention has been directed to the chemistry of therapeutics than to that of pharmacy, and physiological chemistry has been specially dealt with. The whole work is arranged in a series of questions and answers which are, in general, clear and succinct. In a small work of some two hundred pages, it would be unreasonable to expect any thorough exposition of the subject with which Dr. Wilthaus deals, but it is possible that the student may find it of some assistance in refreshing his memory after studying larger manuals.

4. This book is designed to aid the student in acquiring a practical knowledge of botany. Two charts of the natural orders are given, in which the distinguishing characters of the plants are reduced to a minimum, and as the pronunciation of botanical terms is acknowledged to be by no means uniform, the accentuation of both the English terms and the Latin words from which they are derived, is given. A list of the plants most easily obtained during each month in the year, and which will best illustrate the various types and peculiarities of each natural order is added, so that the student may study those plants which flower in the winter, autumn and spring, but cannot be obtained during the usual botanical course, viz., from May to July. The work commences with two diagrams, showing the parts of flowering plants. These diagrams are next explained, then directions are given for the examination of plants microscopically and otherwise. We can heartily recommend Mr. Holme's Note Book, and feel confident that it will prove invaluable to the industrious student in botany.

5. In the present volume, the general principles of organic chemistry are discussed; thus we have the distinctions between organic and inorganic substances; organic analysis and empirical formulæ; the methods for determining the rational formulæ of organic substances; the estimation of nitrogen, the halogens, sulphur, arsenic and phosphorus in organic matter; organic substitution; the theory of compound organic radicals; the hydrides of organic radicals; the distillation of coal; the alcohols; the ethers; the aldehydes; organic acids; the anhydrides; the alkaloids or organic bases; organo-metallic compounds; identification of organic substances; oils, fixed and essential, &c. The book terminates with a description of the apparatus needed in determining the subjects discussed in its earlier pages, and a number of exercises are appended, together with numerous papers set at the examinations of the Science and Art Department, with answers, from 1868 to 1878.

The author has evidently bestowed considerable pains upon his undertaking, and it is probable that the student aspiring for honours may derive valuable assistance from a perusal of Mr. Clement's Manual, but to the ordinary run of students, we are afraid the work will prove of little or no advantage.

Medical News.

Royal College of Surgeons of England. — The following having passed the required examination received the diploma in Dental Surgery at the last meetings of the Board of Examiners:—H. J. Alexander, C. N. Brameld, V. G. Carranza, W. H. Chalcraft, S. Cook, W. G. Daish, E. L. Dudley, C. King, J. H. M'Call, F. H. Newton, S. W. Nunn, J. L. F. J. Pike, D. M. Small, F. J. Thorman, W. G. Weiss. Two candidates failed to satisfy the Board, and were referred for six months.

Queen's University in Ireland.—At a meeting of the University held on the 23rd June the following degrees were conferred by the Vice-Chancellor, Sir Dominic J. Corrigan, Bart., M.D.:—

DOCTOR IN MEDICINE.—Wm. James Cowden, Joseph Crowley, Thomas Dorman, Thomas P. Madden, Chas. Magill, Robert Mitchell, Alexander Sharpe, Jacob Thos. Shipsey, John Simpson, William Smyth, Horace R. Townsend, James Wilson, Wm. Mussen Young.

MASTER IN SURGERY.—Joseph Crowley, Thomas Dorman, A. Oswald Geoghegan, Gilbert Kirker, Thos. P. Madden, Charles Magill, John M'Kinlay, Robert Mitchell, Alexander Sharpe, Jacob Thos. Shipsey, John F. Tuohy.

DIPLOMA IN MIDWIFERY.—Joseph Crowley, Gilbert Kirker, Daniel Riordan, John Simpson, William Smyth, Horace R. Townsend, John Wilson.

Prejudicial Action of Chlorate of Potash.

In a paper read before the Medical Society of the State of New York, Dr. Jacobi calls attention to what he considers the dangers of large doses of this medicine. The dose for a child two or three years old, should not be larger than half-a-drachm in twenty-four hours. He is convinced that large and repeated doses of this drug have proved "dangerous and even fatal in a number of instances, producing one of the most dangerous diseases—acute nephritis." We have not had much experience of very large doses of chlorate of potash, but there may be some truth in Dr. Jacobi's statement, and, at all events, it will be as well to bear it in mind.

On the Prevention of Fatal Accidents from Using Anæsthetics.

Dr. Simonin gives, in the *Revue Méd. de l'Est*, 5 année t. x, No. 9, p. 263, the following three observations, which may be considered as very important if attended to.

1. Progressive peripheric insensibility, especially in the temporal region and the cornea.

2. The condition of the muscles and the jaws; the former must be in a complete state of relaxation, and the jaws closed. The adductor muscles of the lower jaw, therefore, form an exception to the rule, by being in a state of trismus.

3. The state of the pupil, which must be contracted, while the respiration becomes more normal, having been much quickened during the stage of excitement. All these phenomena are very important; they are synchronous, and must be carefully observed, as well as respiration and circulation.

If the three symptoms cited should not appear coincidently, they must be carefully watched for in various stages of the anæsthesia, because they are sure to appear at a given moment.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Mr. W. T. Walters.—The next examination for commissions in the Army Medical Service will be held at the University of London in August next. We understand the exact dates are not yet fixed, but if you watch our advertising columns during July you will be able to obtain the necessary information.

Mr. J. Stone.—We can only give you the same answer.

Pater.—Gant's, Bryant's, or Erichsen's "Surgerys" are the best; the first-named is probably the most complete, more particularly in special subjects.

Dr. C. S. Davis, New York.—We cannot further increase our Exchange List, it is already too extensive for adequate service, and the "Index Medicus" answers every purpose in the direction of which you speak.

HYDROPHOBIA IN LANCASHIRE.

To the Editor of the Medical Press and Circular.

Sir,—John Milner was not under my care, I merely saw him upon the invitation of one of the practitioners who attended. I believe no line of treatment was, or could have been, adopted in his case, as his parents having first summoned several medical men independently to see him, then removed him into the country to be beyond medical interference. My assistant who saw him is not qualified (from pecuniary reasons), but has been fifteen years in the profession, ten of the fifteen with me, and was acting under my specific instructions."

Yours, &c.,

John Holden, M.R.C.S.

[This letter affords an excellent instance of the prevalent feeling about the uselessness of attempting to cope with hydrophobia, and as we see, it extended both to doctor and patient's friends. It also shows how difficult it is to deal with the question of unqualified assistants. We have always advocated the importance and necessity of employing qualified men as assistants, and we need not now reopen the subject. We would recommend to Mr. Holden a small pamphlet by Dr. Offenberg—"Goberite Hundswuth beim Menschen."—Ed.]

[illegible].—We object to make our columns the record of Dr. George Beaney's "munificent gifts," his dinners, or his doings. Our correspondent not being "behind the scenes" is of course unaware of the nature of the communications we are constantly receiving from Melbourne, both in public journals and private letters.

Dr. David McEniry.—Your letter will appear in our next.

Anxious.—The preparation is not a patented one, you can get it made up at any first-class chemists.

Mr. D. L. E.—A review of your book is in type awaiting space for insertion.

Dr. J. A. H.—With pleasure.

M. Betagh.—No dates were given by our correspondent as to the length of time the poison remained latent in the bitten children before its effect showed itself. The point is important, and we will endeavour to ascertain.

G. A. O.—To receive fees, under any circumstances, from, or on behalf of, a dispensary patient, is directly contrary to the regulations, and renders the recipient liable to dismissal. A present given after treatment had terminated might, perhaps, be accepted, if not demanded or suggested by the doctor.

VACANCIES.

Ballycastle Union, Croagh Dispensary.—Medical Officer. Salary, £100, with fees, and £20 as Sanitary Officer. Election, July 11.

Birmingham, Children's Hospital.—Non-Resident Surgeon. Daily attendance required. Salary, £60, with partial board. Applications to the Medical Board.

Brecon Infirmary.—Resident House Surgeon. Salary commencing at £120. Applications to the Secretary on or before July 10.

Dudley, the Guest Hospital.—Resident Medical Officer. Salary, £120, with board. Applications to the Secretary on or before July 7.

Dundalk Union, Carlingford Dispensary.—Medical Officer. Salary, £100, with fees, and £25 as Sanitary Officer. Election, July 10.

Dunfanagha Union, Falcaragh Dispensary.—Medical Officer. Salary, £100, with fees, and £10 as Sanitary Officer. Election, July 16.

Hospital for Women, Soho Square, London.—Assistant Physician and a House Physician. Full particulars of the Secretary.

Narberth Union.—Medical Officer for No. 2 District. Salary, £35, with £10 as Medical Officer, and the usual fees. Applications to the Clerk before July 19.

Oldcastle Union, Crossakiel Dispensary.—Medical Officer. Salary, £120, with fees, and £15 as Sanitary Officer. Election, July 11.

Shillelagh Union, Coolattin and Clonegal Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, July 11.

Shillelagh Union Workhouse.—Medical Officer. Salary, £90, and £10 as Consulting Sanitary Officer. Election, July 11.

Wilts County Lunatic Asylum.—Assistant Medical Officer. Salary, £110, with board. Applications to Dr. Cooke, at the Asylum, Devizes.

APPOINTMENTS.

Alford, C. E., M.R.C.S.E., Medical Officer and Public Vaccinator for the No. 7 District of the Yeovil Union.

Bastable, D. H., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer for the Rosliston District of the Burton-on-Trent Union.

Blake, R. M., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer for the Ravensdale Dispensary District of the Dundalk Union, co. Louth.

Bleakley, A. S., M.B., M.Ch. Univ. Dub., Medical Officer to the Blessington Dispensary, Naas Union.

Dalies, J., M.R.C.S.E., Medical Officer for the No. 2 District of the Bath Union.

Dudgeon, J. M., M.B., C.M., Medical Officer and Public Vaccinator for the Parish of Comrie, Perthshire.

Graham, A., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for the Parish of Currie, Edinburghshire.

Jules, H. E., F.R.C.S.E., Demonstrator of Anatomy at St. Mary's Hospital Medical School.

Ryan, Dr., Medical Officer to the Oulert Dispensary, Enniscorthy Union.

Stafford, T. E., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the West Deeping District of the Stamford Union.

Deaths.

Atkinson.—On June 18, at the Queenstown General Hospital, Henry Seymour Atkinson, L.S.A.L., the Resident Medical Officer, aged 27.

Baxter.—On June 16, at Dundee, Peter M. Baxter, L.R.C.S.Ed.

Chorley.—On June 21, at Maghull, Liverpool, Marmaduke Wilmer Watkins Chorley, M.R.C.S.E., aged 33.

Goodall.—On June 15, at Bournemouth, Alexander Goodall, M.D., Staff-Surgeon R.N., aged 39.

Gray.—On June 13, at Kirkcaldy, Fifeshire, Andrew Gray, L.R.C.S.Ed., aged 60.

Hemsted.—On June 12, at Bath, Henry Hemsted, F.R.C.S.E., late of Speenhamland, Berks, aged 72.

Hooper.—On June 14, at Staunton, Worcestershire, Thomas Hooper, Surgeon, aged 84.

Lochrane.—On June 21, at Middletown, co. Armagh, Jane, the wife of Edward Lochrane, L.R.C.S.Ed., aged 79.

Moffatt.—On June 22, at Kelvingrove Street, Glasgow, Robt. Moffatt, M.D., aged 24.

Snowden.—On June 16, at Gateshead, John P. Snowden, M.R.C.S.E., aged 38.

Treharne.—On June 20, at Bournemouth, John Treharne, M.B., C.M., B.Sc.Ed., aged 32.

Whitla.—On June 26, at Monaghan, James Whitla, L.A.H., aged 35.

Wood.—On June 10, at Shrewsbury, Samuel Wood, F.R.C.S.E., F.S.A., Consulting Surgeon to the Salop Infirmary, aged 67.

Wylie.—On June 16, at Errol, Perthshire, James Wylie, L.R.C.P.Ed., aged 69.

Original Communications.

THE DIPHTHERIA OUTBREAK OF LAST SPRING IN N.W. LONDON. (a)

By T. MORTON, M.D. Lond., &c.

The outbreak of diphtheria to which I wish to call your attention presented some features of unusual interest, and through the official inquiry of which it was the subject, it has been the means of securing at least one important addition to our knowledge of the disease, and putting us upon a new track, which may not improbably lead to further and still more important discoveries.

Mr. W. H. Power's Report of his inquiry made for the Local Government Board, to which I have just referred, is of so recent a date, and attracted so much attention at the time of its publication in December last, that much of what I have to say, being necessarily a reproduction of the Report, will be already familiar to many of my hearers. I have reason to believe, however, that, widely as Mr. Power's conclusions have been noticed, comparatively few have actually read his Report, or are in a position to appreciate the facts upon which his conclusions are based, or the steps by which they were reached.

My principal object will be to place you in this position, by narrating unofficially the history of the epidemic (of which I happened to see a good deal), and enabling you to follow and criticise the lines of thought along which Mr. Power was led by the facts which he so industriously collected.

This will necessarily raise the whole question of the etiology of diphtheria, upon which, together with the allied subjects of its prevention, and its relation to other diseases, I hope a really useful discussion may arise.

The map compiled by Mr. Power, which by the courtesy of Her Majesty's Stationery Office I have been able to place in the hands of members, shows, at a glance, one leading feature of the outbreak, its curious limitation in area. 230 out of the whole 264 cases are crowded within a circle of half-a-mile radius, and all, with scarcely an exception, within one of a mile. Those who know the neighbourhood will also recognise how comparatively good a class of dwellings they occurred in, and how remarkable an immunity adjoining districts of really poor houses in Kilburn Park and Portland Town enjoyed.

The outbreak was almost as curiously limited in point of time. The whole 264 cases are comprised within the four months, March, April, May, and June, 1878, but within these four months the four weeks ending June 25th, form, as it were, an inner circle, in which no less than 78 out of the 118 invaded households were first attacked, and no less than 46 of these households, including 111 persons, in one week. It was this sudden outburst which first attracted attention to the epidemic, and, but for it, the much larger aggregate of cases spread over the other weeks would probably never have been dragged to light and brought into focus. Finding towards the end of May that I had under treatment at one and the same time 25 cases of a disease of which for years I never saw an example, and of which even of late years it was rare to see above two or three in a year, I wrote to the Local Government Board suggesting an inquiry. Others did the same, and at last, and only, I believe, then through the personal intervention of Professor Huxley, whose household was attacked, and who happened to be a friend of Mr. Sclater-Booth's, Mr. Power was set to work, and his inquiries resulted in bringing to light 264 cases in 118 households, grouped in point of place as shown on the map, and in point of time as follows:—

In the first week, ending March 9th, two persons in two households.

(a) Read before the Harveian Society of London, April 3, 1879.

Digitized by Google

In the second 12 in 5 households,
„ third 4 in 2
„ fourth 6 in 5
„ fifth 2 in 2 fresh households,
and one in a household previously attacked.
In the sixth 3 in 2 fresh households,
and one in a household previously attacked.
In the seventh 6 in 2 fresh households,
and one in a household previously attacked.
In the eighth 10 in 6
„ ninth 18 in 10
„ tenth 20 in 7
„ eleventh 111 in 46
„ twelth 37 in 15
„ thirteenth 15 in 8
„ fourteenth 9 in 3
„ fifteenth 6 in 3 fresh households.

It was thus evident that some morbific influence had been operating over a limited area, and during a limited time, with an intensity which began rapidly to increase about the beginning of May, and culminated about the middle of the month, afterwards subsiding even more rapidly. The problem was of course to distinguish and identify this influence.

Direct infection from case to case, and conveyance of the poison by sewer gas, have hitherto been the only recognised modes of propagation of diphtheria, and the latter is rather recognised than established. Water is also an object of suspicion, more from the analogy of other zymotic diseases than from any observed facts. As for water, the affected area formed part of a very large district served by one water company, the West Middlesex, in the rest of which there was little or no diphtheria; while the idea of direct infection, as for instance through school attendance, was out of the question when 111 persons, not all of them children, and scarcely any of them of the class frequenting National schools, were stricken in one week. Besides, Mr. Power ascertained that only in 21 per cent. of the cases had the first sufferer in a household attended school within a week before being attacked.

With regard to sewer gas, however, strong reason for suspicion undoubtedly existed. Let me here again refer to the map. No one can look at it without seeing that the bulk of the cases are comprised within the space coloured yellow, and called "special sewage area," corresponding, as you see, to the greater part of the inner circle, and extending into the outer only to the north, where there are as yet few inhabitants. The two large branches of sewer draining this area, having diameters respectively of 6 ft. × 5½ and 6 ft. × 5, coalesce to form a trunk having, for reasons best known to the Metropolitan Board of Works, a diameter of only 4½ feet for some distance (450 feet). This defect, which is only now being remedied, must necessarily have caused increased pressure of gas upon the house-drains—never in the best neighbourhoods very efficiently trapped—of the dwellings connected with the sewers, whenever they were fuller than usual. An excessive rainfall on April 10th and 11th had, in fact, resulted in the choking of the channel at the constricted part, and the flooding of basements on the line of one of the branches.

It was, therefore, most natural that the public opinion of the district, and especially the parochial mind—which is the constituted guardian of the public health, and is conscious of its ignorance of anything connected with public health, except sewers—should have unhesitatingly referred the epidemic to this state of sewers. And I believe Mr. Power was for some time rather inclined to the same opinion, especially as he found that the cases seemed to have a tendency (shown in the map in several places) to group themselves on short lines of sewers having dead ends.

The most obvious explanations of natural phenomen are not, however, always, or even usually, the true ones and there remained the not inconsiderable number of case in the rest of the inner, as well as those in the outer, circle, to be accounted for. Besides, it was not easy to see how a sewer obstruction in the first half of April could account for an outbreak of diphtheria in the middle of May, unless the disease when conveyed in this way, required a very much longer incubation period than it is known to have when taken by direct infection.

On the occasions when typhoid fever has been disseminated by means of milk, it has been found to occur in outbursts such as this, but I doubt if this analogy would have been sufficient to prompt a thorough investigation of the question of the agency of milk in this instance had it not been for a fortunate accident. Mr. Power is good enough in his Report to give me credit for having first suspected the milk, but if there is any priority, it should rather belong to another member of this Society, Dr. Platt, who had reported to him, and at once appreciated the importance of, a remark made by a milk carrier to a patient of his. The man was discussing the prevalence of diphtheria in the neighbourhood, which he said must be very great, "for they had got it at half the houses he served, and he only served one house in Hamilton Terrace, and they had got it there." Following up this clue among our own cases, we soon found that, although perhaps half of them were supplied by this man's master, a large number dealt with another shop in St. John's Wood. The thread seemed, however, to be recovered again on my ascertaining that the first-named dealer, whom we may call Mr. A., obtained the whole, and second, whom we may call Mr. B., a large part of his supply from one and the same cow-keeper. This man, who was a patient of mine, behaved very well, and, at a word from me, at once discontinued—at considerable inconvenience and expense to himself—the use of an underground tank, whose existence in his yard, though only supposed to be used for watering the cows, I considered a source of danger. It had occurred to Dr. Platt and myself that although the inside of the tank was cemented, some injurious matter might have found its way into it on the occasion of the flood in April, when a mews, opening into his yard, but on a lower level, was flooded with sewage.

It is curious that the closing of this tank coincided very closely in point of time with the subsidence of the outbreak, but I do not believe, in view of the further facts which I shall cite, that it had anything to do with it.

We now come to the more serious and systematic investigation into the milk question, which Mr. Power was induced to make by the case of suspicion which thus existed in regard to it.

He found that the sheds of the cow-keeper to whom I have referred, and whom he calls Mr. X., yielded daily about eighty barn gallons of milk, of which forty-seven were retailed by Mr. A., who sold no other, and twenty-four by Mr. B., who had also another shop, not in St. John's Wood, but in Kilburn, where he retailed milk from a different source. The remainder of Mr. X.'s yield, a varying quantity, went to eight other small dealers in rather low neighbourhoods.

Mr. A. and Mr. B. both would, from the situation and extent of their businesses, have a large number of their customers resident within the inner circle, and it was therefore to be expected that, whatever was the cause of the outbreak, a large number of their customers would be attacked.

Mr. Power found that Mr. A. supplied 236, and Mr. B. 237 of the 2,700 households in the inner circle, that is about a fifth of all the households between them, so that if milk had no effect they should have had 19 out of 98 affected households between them, the other 79 being divided among the various milkmen who supplied the other 2,227 households. In fact, however, Mr. A. had 37, Mr. B. 31, and all the other milkmen only 30 between them, a difference of 143 per thousand against 13 per thousand, or 11 to 1.

In the outer ring, containing about the same number of households, of which they supplied between them about

Digitized by Google

100, things were much the same; these hundred households were hit twelve times as hard as anybody else.

We must not forget, however, the existence of the sewage area, as the whole matter might conceivably be explained by their customers being found to reside in very large proportion on that area, and being hit so hard in consequence of so residing. What do we find, however? The sewage area contained 2,300 households, out of which they supplied 430, less than a quarter; out of the 430, 64 were invaded, or 148 per thousand; out of the remaining 1870, only 22, or 11 per thousand—a difference of 13 to 1 among persons under exactly similar conditions as regards sewerage.

It seems to me impossible after this for any candid mind to avoid the conclusion that the real cause of mischief resided in the milk and not in the drains.

Individual instances are far less to be trusted than broad figures such as I have just quoted, but they are often more striking and serve well to illustrate them. I may, therefore, quote a few instances, such as the following:—

In Upper Hamilton Terrace, Mr. A. had, as we already know, one customer, Mr. B. nine. Mr. A.'s customer, and four of Mr. B.'s were attacked, making 5 out of the 6 households attacked in this street of 35 houses. In Marlborough Place, containing 18 houses, Mr. B. supplied 4. Of these 3 were attacked and no others in the street. In Abercorn Place, of 35 houses, Mr. B. had two customers; one of them was attacked and nobody else. In Holtham Road, of 17 houses, Mr. A. supplied one, which was the only house attacked in the road. In Alexandra Road, of 195 houses, Mr. A. supplied 15, of which 5 were attacked, out of 8 which suffered in all.

It is time now that we turned to the other affected households, such as these three in the Alexandra Road, which did not deal with Mr. A. or Mr. B. They number 44 in all, but 17 of them had their milk from retailers not wholly innocent of relations with Mr. X. the cow-keeper. I shall return to them presently. The other 27 houses certainly did not receive any of his milk, but it does not follow that some of the inmates may not. Some of them were supplied from Mr. B.'s second shop, from which none of Mr. X.'s milk was supposed to go out; but it is very likely that when the supply ran short, some would be transferred from the shop in St. John's Wood. Again, one house where I lost a case was almost next door to Mr. A., and no other milk shop near. The family did not deal with him, but I suspect they often ran in for some extra milk. Another young fellow, whose attack I was rather puzzled to account for, proved to be in the habit of going out on his bicycle before breakfast, and refreshing himself with half-a-pint of milk when he met Mr. A.'s man on his rounds. Another was very fond of milk, and ran into Mr. A.'s shop to drink some when he had been having his hair cut just opposite. Then, little children often go out to tea, which consists of milk and water, in one another's nurseries; and finally there is the ordinary propagation of diphtheria by direct infection, which is constantly going on amongst us, and would be likely to be much more active than usual at this time from the multiplication of opportunities of infection.

I said the other seventeen households were not wholly innocent of relations with Mr. X. Four of them dealt with the small retailers above referred to, into whose stock the balance of his yield went. The other thirteen were supplied by a man whom we have not yet heard of, called M. by Mr. Power, who is in a large way of business as a milk-seller near the Adelaide Road. Week after week, through March and April, one, two, one, four, one, and again one of his customers were struck, until seven had suffered in the inner and six in the outer ring, and this at a time when there was so little diphtheria in the district, that only 18 houses had been attacked in the inner and 8 in the outer ring at all. So that the ratio of attacks among his customers—who by reason of the situation of his business were not very numerous in the district—must have been far too large as compared with others to be accidental or insignificant.

There was thus some ground for suspecting that diphtheria had followed the track of Mr. M.'s milk-pails before it attached itself to those of Messrs. A. and B.; and that is all we should have been justified in affirming but for the relations already hinted at, which were found to exist between Mr. M. and Mr. X.

It seems that Mr. X., besides his cowsheds at Kilburn, with which we are already familiar, carries on a distinct and separate business as a dairy farmer at Muswell Hill. The two businesses are miles apart, and though they have a common owner, each has a separate staff, and there is nothing else in common between them, except that cows are generally purchased for both from the same source, and that hay from the farm goes to both sets of cows, and grains from the same brewery.

The yield of the farm is about 54 barn gallons daily, and of these Mr. M. contracts to take 9. As, however, he distributes, in addition to this, milk from other sources to three or four times the amount, we have no right, without further evidence, to accuse the Muswell Hill portion of his supply any more than that from the the other sources, merely because mischief had been traced to cowsheds at Kilburn, belonging, it is true, to the same man, but quite distinct in all other respects.

Accordingly Mr. Power, nothing daunted by the ever-widening range of his inquiry, set to work to follow up the rest of the 54 daily gallons. Nineteen were found to go to a dealer at Fortis Green, ten to another at West Islington, two and-a-half to another at Colney Hatch, and thirteen to New End, Hampstead.

Is it not very striking to find that at Fortis Green and neighbourhood a serious prevalence of diphtheria and throat illness excited in April last considerable attention and no little alarm? Locally, the outbreak was attributed, I need hardly say, to sewer emanations; but the result of an inquiry by the medical officer of health of the district did not support this theory. This gentleman found that the diphtheria had been pretty equally distributed over a district served by "three perfectly distinct and unconnected lines of public sewers." Subsequently, by personal inquiry in the district, conducted broadly on lines similar to those adopted in the Kilburn inquiry, Mr. Power was able to satisfy himself that for the above and for other reasons, sewers might here be excluded; and that other ordinarily ascribed causes of diphtheria, such as water supply, personal communication of the healthy with the sick, and the like, might in the majority of instances also be set aside. But the circumstances in regard of milk service were at least suspicious. Milk he found had been distributed to the several hundred houses of the district mainly by two retailers residing near together; one, Mr. N., who obtained a considerable proportion of his total supply from Mr. X.'s Muswell Hill business, the other a tradesman whose supply was altogether different.

From the middle of March to the end of June, 27 households in all were invaded. Of these 19 obtained their milk supply from Mr. N.; and further, of 17 households invaded during the first three weeks of the outbreak, all but three were so supplied, and these three exceptions are in their way noteworthy. The first was a youth employed by Mr. N. in his milk business, but living in St. James's Lane. The second was a brother to this youth, living in a separate household near at hand; and the third was a young woman—I believe I should be justified in saying *his* young woman—living in a house next door to that in which the youth himself resided.

Taken by itself, the evidence tending to implicate the Muswell Hill milk that is afforded by examination of the circumstances of throat illness in and about Fortis Green is pretty strong. But taken in conjunction with that adduced respecting similar association at the same time of throat illness with the milk supply of Mr. M. in

Digitized by Google

St. John's Wood, it acquires much additional force. The facts that need to be insisted on are as follows:—In two localities so widely separated, and so utterly differently circumstanced, except in this one matter of milk service, as St. John's Wood and Fortis Green, diphtheria attacked almost simultaneously customers of retailers supplying the particular milk, continued to attack such persons with similar but moderate force for several weeks, and then again simultaneously in both places ceased to attack them.

At West Islington Mr. Power was not able to make personal inquiry, as he did at Fortis Green, but he ascertained that the only three fatal cases of diphtheria recorded in the district in March and April corresponded in point of time with the Fortis Green cases, and occurred in households supplied by the milkman who took the ten gallons from Muswell Hill.

At Colney Hatch, again, of six households invaded in April and May, four were served by the milkman who had relations with Mr. X, and only two by other milkmen.

At New End, Hampstead, where the neighbourhood is populous and continuous with the metropolis, Mr. Power was not able to do more than satisfy himself that the only households, two in number—fatally invaded in March—both obtained milk from the retailer who took some of the Muswell Hill milk.

The evidence from each of these last three localities is not in itself of course very strong, but it has considerable force as a whole from the improbability of diphtheria occurring simultaneously in three centres so far apart, except from some common cause, and it serves strongly to corroborate Mr. Power's conclusion that "the milk supplied to retailers by Mr. X from his Muswell Hill business was in March and April, an essential factor in the causation of diphtheria, just as milk supplied to retailers from his Kilburn business was in May and June similarly though much more seriously effective."

Few, I think, of my hearers will decline to follow Mr. Power as far as this, though some may not consider the evidence about the Muswell Hill farm quite as complete and decisive as that about the Kilburn cow-sheds.

When, however, we try with him to follow the scent a stage further, and hunt down the mysterious agent whose activity was was developed, first at Muswell Hill in March and April, and then transferred to Kilburn in May and June, we traverse a more difficult line of country, and I can hardly expect to take the whole field with me over such leaps as it is necessary to take. And yet the scent certainly seems to lead in one direction, and one only. To drop metaphor, Mr. Power was led by his inquiries at Kilburn and Muswell Hill to exclude one by one all the various conceivable modes in which the diphtheritic poison could with any probability have been introduced into the milk after it had been drawn from the cow.

A good many of them are excluded by the requirement —which can alone satisfy the conditions of the problem —that they should be in continuous operation for several weeks, first at Muswell Hill and then at Kilburn. Not a person at either place had had anything like sore throat, or been transferred from one business to the other. The water at neither place was absolutely secure from foul soakage; but at Muswell Hill it was drunk with impunity by the household, while at Kilburn the question of its purity is almost put out of court by the circumstance that the milk furnished to Messrs. A. and B. was fetched by them in their own churns, which were cleansed at their respective places of business. No cow-sheds are free from the chance of careless fouling of utensils by refuse litter, &c., but this would only be an occasional thing, and would not explain the course of events which we have followed.

The question of absorption of poisonous matters through the air hardly arises in the absence of any pre-existing cases of diphtheria in the premises or their immediate neighbourhood. Besides, milk is never standing long enough at either place to absorb much, as quick despatch is of the essence of a milk business pure and simple, into which the production of cream or butter does not enter.

CONTRIBUTION TO THE STUDY OF THE OSSEOUS TUMOURS ON THE EXTERNAL AUDITORY MEATUS.

By Dr. DELSTANCHE, fils, Brussels.

Translated, by permission of the Author, from the "Mémoires Courronnés et Autres Mémoires," de l'Académie Royale de Médicine de Belgique,

By JAS. PATTERSON CASSELLS, M.D., M.R.C.S., Lond.,

Fellow of the Faculty of Physicians and Surgeons; Surgeon to the Glasgow Dispensary for the Diseases of the Ear; Aural Surgeon to the Glagow Royal Infirmary; and Lecturer on Aural Surgery in the Royal Infirmary School of Medicine, Glasgow.

Among the pathological changes that take place in the ear, there is none in which study leaves so much unrevealed as in the case of exostosis of the external auditory meatus. The writings relative to this affection which the medical literature of the last thirty years contain, far from throwing light on the subject, seem in the end to render it more obscure.

In order to show that this is no exaggeration, it is only necessary to state how many contradictory opinions exist in regard to the nature, form, and frequency of osseous tumours of the external auditory meatus, and their treatment.

The existence even of this affection has been questioned by Bonnafont (in the first edition of his treatise on "The Diseases of the Ear," 1860.) Notwithstanding that publication, however, so soon as our distinguished *confrère* was convinced of his error, he was one of those who contributed the most to make these morbid productions known, and to perfect their treatment. The facts which brought Bonnafont to contradict his former statements, and which he made the subject of a very remarkable communication to the Academy of Medicine of Paris, appeared to convert many incredulous persons. Thus our surprise was very great when, on glancing over a recent work by Erhard (of Berlin) our eyes fell upon two paragraphs, of which the following almost literal translation preserves the sense most rigorously:—

"It is not yet peremptorily demonstrated that exostosis and hyperostosis can, once the period of ossification of the membranous meatus is finished, be developed in the bone itself, as the consequence of certain primary pathological causes. The two external auditory meatuses, varying more or less in every individual, it follows also that unilateral contraction can easily occasion illusions.

"It is not yet proved that syphilis, in this relation, exercises a specific influence. We meet, it is true, hyperostosis, in cases of inveterate otorrhœa, whose commencement dates from infancy, but I have never seen it developed at a more advanced age."

We confess that, after having read and re-read these lines attentively, the only ones that Erhard has dedicated to the subject that we are engaged on, we still hesitate to regard them as the real thoughts of the author after having sought for another interpretation more in conformity with the generally received ideas—the ambiguity of the text justifying our reserve — although we are unwilling to admit that one of the most celebrated specialists of Germany has not had occasion in his long experience of the

Digitized by Google

affections of the ear to assure himself of a fact about which very little is known, although the examples of it are very common according to the best authors, among whom we may name Von Trœltsch.

But if Erhard allowed it to be seen clearly that his scepticism in regard to exostosis of the internal auditory meatus did not extend to these tumours which have a congenital origin, the thing could, perhaps, be explained, but the care which he takes to warn us against illusions which the difference of the diameter of the two meatuses could give rise to, then his silence on the subject of exostosis, while he mentions in another part the existence of hyperostosis in certain cases of chronic otorrhœa, as observed by himself, scarcely agrees with such a supposition. However, it is only curiosity that prompts an explanation, because the fact of the existence of congenital exostosis of the external ear has already been too well established to gain advantage from the further discussion of it. What is of more importance for us to note in the lines of Erhard is that he not only contests the etiological connection which should exist, according to some authors, between certain morbid constitutional states—notably the syphilitic diathesis—and the tumours in question, but he questions the development of these tumours themselves, if not absolutely, at least after the period of ossification. We will examine the value of those opinions in the course of this *mémoire*.

In the present state of the science of otology, it would be premature to try to find out if the various peoples of Europe were all equally susceptible to exostoses of the external auditory meatus; or rather, if the proportion of the latter, in a given number of individuals, were subject to notable differences according to race and geographical situation. In fact, however, the study of the affections of the ear is neither so advanced nor sufficiently generalised to furnish the degree of certitude which is indispensable to such a statistic. Also, the elements of comparison which we could produce at this present time would only lead to erroneous deductions. It has been, however, ascertained that the greatest number of cases of this affection has been found in those countries where otology has mostly, and for the longest time, attracted the attention of scientific men, as in England, Germany, Austria, and France; whilst we know nothing of what concerns the southern nations of our continent.

Be that as it may, the investigations of Professor Seligmann (of Vienna) show that Europeans are far from being so subject to exostosis of the canal of the ear, as are certain races of American Indians, among whom the custom of lengthening the skull artificially, still prevails.

Out of six cases of "Siticacas" thus deformed, Seligmann has five times met with the anomaly in question; but he adds that he has not found an instance of it in the skulls of another American tribe, the "Avares;" although their skulls are identically deformed. The enormous proportion of exostosis of the ear observed in the "Siticacas," cannot then be attributed to the manipulations to which their heads are subjected, but rather to a predisposition of race. Besides, Welcker, from whom the preceding details are borrowed, has also met with osseous excrescences in North American Indians, whose skull is not deformed, as well as in the natives of the Marquesas Islands—a fact, which would tend to prove that the transatlantic peoples are more inclined to exostosis of the ear, than the races that inhabit our continent; for of all the skulls of the Caucasian race that have been examined by Welcker, none presented a trace of this affection, although their number was greater than that of the skulls of foreign origin.

Of all the tumours that were formerly confounded under the name of exostosis, the only ones, according to Nélaton, that have a right to the name, are those that are the result of an abnormal and partial expansion of the tissue of a bone, or the deposition of new matter upon some circumscribed part of its surface. They are all uniformly composed of osseous tissue of normal character. Thus *cellular* exostoses are constituted by an osseous areolar tissue, which envelops a thin plate of compact osseous tissue; the others, ivory exostoses, are entirely formed of a compact bony tissue of considerable density.

Schwartze is of opinion that the spongy or compact state of the exostoses expresses different phases in the development of the new growth; that, for example, an exostoses, which at first is spongy, can pass into the ivory state. He believes, also, in the possibility of inverse transformation. This opinion is equally shared in by Virchow and Nélaton.

The intimate structures of the exostosis of the auditory meatus, which Toynbee has been able to study, were all formed of compact osseous tissue; and we do not believe that we are mistaken in attributing to this circumstance, the dread which Toynbee had of removing these tumours by operation. The numerous facts, till now, not only attest that such an aversion was uncalled for, but they show, besides, that the osseous tumours of the auditory meatus—those at least, which, by their volume, call for the active intervention of skill—belong almost always to the cellular form, and offer, in consequence, greater facility to surgical treatment, than if it were a question of operating upon compact osseous tissue.

But if these conditions, which are propitious to the success of the operation, be met with in most cases, it is necessary to guard against concluding that the cellular exostoses of the ear exceeds in number those that are compact, because, as has already been remarked by Nélaton, "the generally slow growth of these tumours seem to be in proportion to their density." It follows that cellular exostoses develop with more rapidity than the others, and reach more easily to a size, which renders their removal from the meatus necessary.

Exostoses of the external auditory meatus are generally seen under the form of peaked or elliptical projections, with a smooth or slightly undulated surface, whose extreme hardness suffices to distinguish them from other tumours that could be developed in the same place.

They have usually a wide base, which instead of being clearly defined, is imperceptibly lost in the neighbouring osseous tissue. They are rarely pedunculated, as in the case Kramer speaks of, where a "polypus was suspended, in the form of a stalactite, from the superior wall of the auditory meatus, and which was so hard that the sharpest knife could not cut it." It is a strange thing, that the only pedunculated exostoses observed by v. Trœltsch also, sprang from the superior wall of the osseous canal of the ear, in the immediate neighbourhood of the tympanum. As to sessile exostoses, they may arise from any part of that canal, but according to the facts observed, till now, they seem often to originate on the posterior wall, less frequently on the superior and exceptionally on the anterior, unless, there be at the same time, in that last case, one or more analogous productions on the other walls.

They have a marked tendency to develop themselves simultaneously in the two ears, although cases, where they are only on the one side, are much more frequently met with, according to our experience. We do not agree in that point with v. Trœltsch, who has seen them almost always in both meatuses, but Wilde says expressly, that he has rarely observed bilateral exostoses; and the cases ascertained by Bonnafont, corroborate, in their turn, the opinion that we have formed in regard to that point.

In cases of bilateral exostoses, the parts of insertion of the tumours exactly correspond in the two meatuses, and they have, further, a certain analogy in form, and sometimes even in dimension. As is well known, this law of symmetry does not hold constantly, even with exostoses of the external ear.

Although these osseous excrescences rarely attain to a large size in the auditory meatus, yet they are sometimes developed so as to efface the lumen of that canal, and it is to be noticed that this complete occlusion is much oftener caused by one tumour than by the meeting of several. Indeed, when two exostoses spring up opposite each other and their tops meet, they almost always reciprocally impede their ulterior development, and the space comprised

Digitized by Google

on each side, between them and the periphery of the canal, remains permeable. It also happens that there may be three tumours, situated side by side, each occupying an equal segment, or nearly so, of the circumference of the canal, and only leaving in the centre of the latter a triangular orifice. This disposition of these tumours may be likened in appearance to the aortic valves, or to those of the pulmonary artery.

Multiple exostoses are usually developed in the neighbourhood of the membrana tympani, while single exostoses spring up nearer the entrance of the meatus, and then it is often necessary to draw the auricle aside in order to see them.

The intimacy of the relations existing in the canal of the ear, between its periosteum and the integument, which constitute here a single membrane, gives, as a necessary consequence, a cutaneous lining to the osseous tumours of that canal without interposition of other elements; contrary to what is usually observed for analogous growths, in other parts of the body. The skin, also, which covers the surface of the exostoses of the meatus adheres strongly. It is almost always smooth, stretched, thin, and entirely hairless, even on the parts where, in the normal state, the hairs are found. It borrows, also, from the underlying bone, a characteristic aspect, which has been compared to that of polished ivory.

Such is the appearance which these tumours present in examination when the tissues of the meatus are neither irritated nor inflamed. When, however, the parts are inflamed from any cause whatever, the surface of the tumours presents a more or les dark red colour, according to the degree of hyperæmia.

When the affection is complicated with otorrhœa, the integumental envelope of the exostosis may become thick and spongy and granular.

Whilst v. Trœltsch insists upon the extreme sensibility of these tumours when touched, most observers, on the contrary, mention as one of their most remarkable peculiarities, their insensitiveness, as they can be touched, and even struck with some force, without causing pain. According to us, both of those contradictory affirmations contain truth; because if it be true that the exostoses, situated less deeply in the canal of the ear, are open to manipulation, it is exactly the opposite for those seated in the neighbourhood of the membrana tympani, or which are found in immediate contact with that membrane. These latter seem to be very sensitive to the slightest touch, but whether they participate in the extreme sensibility of the neighbouring membrana tympani, or that the latter feels the *contre-coup* of the shock, which one makes upon the tumour in examination, is difficult to say. Moreover, the walls of the external auditory meatus become more sensitive as one approaches the membrana tympani. Why, then, does the sensibility of the exostoses not vary equally according to the part of the canal where it has sprung up?

Nothing is positively known about the circumstances which occasion or favour the appearance of the osseous tumours in the external auditory meatus; but for want of certain ideas on this subject, the field of hypothesis has been greatly worked by authors. According to the opinion of Toynbee, also shared in by v. Trœltsch, the abuse of alcoholic liquors and exciting food is not without some influence on the growth of these tumours. Hence the almost absolute exemption from this affection of females who are by nature less given to excesses, and particularly to those of the table. Is it necessary to acknowledge the truth of the cause here stated? We doubt it for our part. First, because our personal observations, having been almost exclusively confined to persons of the male sex, do not permit us to share in the opinion of our *confrères*. Then, because the latter has not been justified, as far as we know, by any of the cases of exostoses of the external ear, observed till now in the female.

The influence of heredity appears less disputable. It is, according to Schwartze, the only predisposing cause which deserves to be accepted, without reserve, in regard to exostosis of the ear (*loc. cit.*, p. 41). One of the most remarkable cases which evinces, says Nélaton, the influence of this cause, is reported by Boyer. It is the case of Madame Pélerin, who was herself affected with several exostoses, and whose father, brothers, sisters, nephews, and children bore similar tumours. It is true that it is not a question here of exostoses of the external ear; but for all that the example is none the less convincing, because no one will dispute the identity of the nature of these morbid growths, at whatever part of the skeleton they are seen. For this reason, we believe, to be able also to include among the causes of the exostoses of the auditory meatus, this general predisposition to the formation of these growths. To this state, spoken of by Nélaton, whose nature is unknown, it is necessary to attribute, at least, the appearance of these osseous tumours in the meatus of any one who is the subject of such growths, in some of the other bones of the skeleton, and that we have reason to expect these growths in the meatus in such cases, is well shown by statistics. (C. O. Weber.)

Dr. L. B. (author of an Observation on the Exostoses of the Auditory Canal, the *résumé* of which will be found further on) seems disposed to admit that a mechanical irritation continued for a long time on any part whatever of the osseous auditory meatus, can give rise, at that place, to an osseous tumour. Such a supposition seems to us probable, as Virchow has shown that local injuries to a bone can give rise to an osteoma.

According to some authors (including Wilde and Rau), the exostoses of the external auditory meatus originate in an ostitis or a periostitis according to others; they are only observed in syphilitic subjects, and constitute a tertiary manifestation of that disease, such is Triquet's idea. Others, with Toynbee, regard their origin as the effect of the gouty or rheumatic diathesis.

J. Gruber, although not sharing exclusively the ideas of Triquet and Toynbee, in regard to the origin of those growths, considers that such states may have an influence on their production. In respect to the syphilitic diathesis, he has been frequently able, with certitude, to ascribe the development of osseous tumours in the external ear, to this cause; for example, when they are present in persons still a prey to syphilitic affections of the bones, or who have previously suffered from it.

Such observations have not influenced v. Trœltsch, since he still persists, in the last edition of his "Treatise," to doubt it, yet without expressing an opinion himself on the cause of the growths in question. According to him, the *rôle* played by the gouty diathesis is still problematic; besides, he has never observed, in the subjects of exostoses of the external meatus, the presence of arthritic deposits on any part of the body whatever, and not even on the auricle which, according to Garrod, would be one of the most likely parts of the body in which to find the manifestations of a gouty diathesis (*loc. cit.*, p. 125).

Our own experience does not give us sufficient authority yet to take part in the debate. Nevertheless, the numerous observations which we have made enable us to exclude rather than to admit any ætiological connection whatever between the rheumatismal or the gouty diathesis and exostoses of the external ear, and to attach in most cases their origin to a chronic inflammation of the walls of the auditory meatus, sometimes primary, sometimes consecutive, to an analogous lesion of the middle ear.

A CASE OF IMPASSABLE STRICTURE OF THE URETHRA—BOUTONNIERE OPERATION—CURE.

By W. F. TEEVAN, B.A., F.R.C.S.,
Surgeon to the West London Hospital, and Surgeon to St. Peter's Hospital.

JOHN Y——, æt. 53, superintending boatswain of the Bombay Dockyard, was admitted into St. Peter's

Digitized by Google

Hospital, on September 25, 1874, having been recommended to me by Mr. Kesteven.

History.—Thirty-three years ago, gonorrhœa, followed by a long gleet, both treated by injections. Twenty-five years ago retention, after a plunge in the sea, relieved by metal catheter. Twenty-four years ago African fever. Eighteen years ago ordered, with 60 men, to take possession of an opium storehouse at Patna, from which the opium had just been removed. Patient and fifteen men slept in the storehouse, and the very first night six of the men, including the patient, were seized with retention. There was only a dispenser with the detachment, who gave them some chloroform internally, which did no good. The patient suffered from retention for ninety-six hours, at the end of which time urine began to dribble away. Ever since that period the patient's stream of urine has been small and twisted. Two years ago attacked with ague, then fever, then dysentery. One year ago dribbling of urine came on. At first, it only occurred in the day, but afterwards, he was affected both night and day. For a long period has suffered from spasm whenever he wanted to make water. In December, 1873, was invalided to England. January 17, 1874, arrived in this country, and at once went to Brighton, where his dysentery got well; but after the first fortnight, he was attacked with swelling and pain in the perinæum. Sent for a surgeon, who opened the perinæal abscess, from which a large quantity of pus escaped; urine also dribbled away from the wound, which completely healed up before he left Brighton in April. His surgeon then made several attempts to pass various instruments, but did not succeed. The day the patient came to town he was seized with retention, and went to a hospital, where the surgeon, failing to pass a catheter, had him put under chloroform, introduced a fine metal catheter into his bladder, drew off the urine and left in the instrument. The patient states that although the catheter was passed into the bladder it did not go there by the natural route, and so great was the agony caused by the presence of the instrument, that it had to be removed after six hours. He was in the hospital for four months, during which period various attempts were made to pass different instruments without success, and as he was again attacked with dysentery, and was in very feeble health, he went again to Brighton. He got rid of his dysentery down there, but suffered so much from spasm and straining, that he came up to town last September, and placed himself under my care.

State on admission.—Patient is a strongly built man, but has lost flesh, and is now in very feeble health. The expression of his face is careworn, and indicative of much suffering. His penis is enveloped in a number of small towels to protect his thighs from the urine which dribbles away. The dribbling, however, is not continuous, and about every hour he is seized with spasm and urgent desire to micturate. After straining for some minutes very violently, during which period he becomes purple in the face, he manages to squeeze out a few drops of urine. His water is a collection of urine and much pus, together with some disintegrated blood. The perinæum shows the cicatrix that resulted from the abscess, and his urethra is much thickened all the way down. The stricture is situated 4¾ inches from the meatus externus.

I kept the patient at rest on his back, and applied leeches to the perinæum to allay the great irritation that existed. Every other day I passed different kinds of instruments—soft and metal—down to the stricture, but I never succeeded in even finding the entrance to the stricture.

On October 12, Mr. Knott put the patient thoroughly under the influence of ether, and I then tried to pass various instruments, but without success. I also gave a fair trial to the following plans, all of which failed.

Firstly. Mercier's plan of passing a tube, as large as the urethra will take, down to the stricture, and having filled it with fine olivary whalebone bougies, to endeavour to pass each one separately. I look upon this as the most valuable of all plans.

Secondly. Cazenave's plan of ice in the rectum.

Thirdly. Sœmmering's method of injecting the urethra with oil to distend the walls and open up the mouth of the stricture.

Fourthly. Mr. Thomas Smith's plan of getting the patient to make water at the moment you are trying to pass the instrument. Although it failed in this particular instance, I must say I have found it succeed in other cases where everything else had failed, and I look upon it as a most valuable measure.

Fifthly. The potassa fusa. I applied this four times, and although it did not enable me to pass an instrument, it completely cured the patient of his dribbling and spasms.

He is profuse in his praises of the caustic, for it cured him of his spasm, and bestowed on him a dry bed at night, and a dry pair of breeches in the day—luxuries to which he had long been a stranger.

It will thus be seen that I had delayed operating, as I considered the man in such bad health, that it would be well, if possible, to avoid any such measure, except as a last resource. As, however, the man's leave of absence was expiring, I determined to operate, and accordingly did so on December 7, in the presence of Dr. Wachtel, of Berlin, Dr. Lane, of San Francisco, Dr. Vanderver, of Albany, Dr. Lovejoy, of Boston, and others.

When the patient was fully under the influence of ether, I tried for the last time, without success, to pass various instruments. I then introduced a straight grooved steel director down to the stricture, and opened the urethra for one inch and a half above the stricture. The edges of the wound being kept well apart with hooks, I set to work with fine olivary whalebone bougies to find the entrance to the stricture, and after a few minutes, I managed to pass one of them into the bladder, as I thought. Now come the modifications introduced, I believe, by me. Where had the bougie gone to? To settle this question I took a fine silver catheter, open at both ends, with a slit in its convexity, and having passed it over the bougie, I slid it along the bougie and withdrew the latter, when urine issued from the catheter. I then introduced a tenotome into the groove, and having placed my left forefinger in the rectum, I completely divided the stricture without enlarging the original external wound. A full sized olivary elastic catheter was then passed all the way from the meatus externus into the bladder, and left there till late that night. Three days after the operation the patient got up for a few hours. Seven days later the wound was quite healed. Seven days afterwards the patient left the hospital quite well, and able to pass 25 catheter with ease for himself.

Special.

HYDROPHOBIA IN LANCASHIRE.

On account of the interest aroused by the publication of our article, June 18th, on this outbreak, and the numerous inquiries received for fuller details, Mr. John Rigby, M.R.C.S., of Preston, who was called in to see one of the deceased victims, has kindly supplied us with the following report:—

Beatrice Watson, aged 5 years and 9 months, a fine little girl, in appearance and growth looking considerably older, was bitten by the Rev. G. R. G. Pughe's mastiff bitch about 5 p.m., on Wednesday, April 16th, 1879. I saw her about an hour after the infliction of the bite, and found that it had caused an extensive and deep lacerated wound of the right side of the face, of somewhat crescentic form, making a flap of a very large portion of the cheek, and extending through the right labial angle into the mouth. I was told there had been a considerable amount of bleeding from the wound, but when I arrived this had almost ceased.

The wound was washed thoroughly with warm water strongly charged with Condy's Fluid, and brought together by five sutures and strips of adhesive plaster, and covered with lint saturated with the same fluid. During the first

Digitized by Google

week there was a considerable amount of swelling of the side of the face, and the wound suppurated freely. There was also, for two or three days, a moderate degree of febrile disturbance. The wound was syringed daily with Condy and water, and covered with lint as at first. After the first week the healing process went on rapidly, and by the sixteenth day the wound was entirely cicatrised with the exception of two small points where two of the sutures had been inserted, the girl's general health being at this time quite satisfactory, and she was going about and amusing herself outdoors. This favourable condition continued until the evening of Saturday, the 10th of May. When I called to see her in the afternoon of that day, she was out of doors playing with her young companions, and seemed perfectly well. The two unhealed points before mentioned were still there, but they had become very minute.

Late on Sunday night, May 11th, the father of the child came to my house stating that she had not seemed so well since the previous evening, when she manifested considerable reluctance to have her usual weekly bath, of which she had always previously been very fond. Since that, he said, she had been restless and fretful. I questioned him very closely as to any symptoms of difficulty of swallowing, but he said there was no difficulty in this respect. Thinking, therefore, and hoping, that she might be suffering only from the effects of a feverish cold, I prescribed a diaphoretic and sedative mixture, and said I would see her next morning. When I called in the morning I was informed that she had had a very restless night, and that very little medicine had been taken in consequence of great difficulty of swallowing having come on. I was also told that she had complained a good deal of pain in the right side of the face in the situation of the wound, and on examination I found appearance of recrudescence, at the two points previously mentioned. They looked livid and more open, and there was an ichorous-looking discharge from them. From this time the usual symptoms of hydrophobia rapidly developed. A striking feature of the case was the remarkable hyperæsthesia of the facial cutaneous surface; a slight puff of the breath on her face at once produced a severe paroxysm of laryngeal and pharyngeal spasm, and a manifestation of horror and deprecation that was painful to witness, although when I blew upon her bare arm only no such result followed, at least this was the case on Monday the 12th. On account of the great difficulty of swallowing, the attempts to give food and medicine by the mouth were discontinued, and the treatment afterwards was the administration every three or four hours of nutritive enemata, to each enema chloral hydrat., gr. x.; potass bromid, gr. x.; and morph. hyd. gr. ½, were added. Under this treatment she obtained many hours' remission of dreadful suffering, but forebodings as to the result were only too surely realised. The treatment, though alleviative, was not curative, and the poor child succumbed from exhaustion at 11 p.m. of Wednesday, May 14th, four weeks and a few hours after being bitten. There was no post-mortem.

Monday, May 12th, 1879.—Temp., 10.30 a.m., 100 2-5ths; pulse 140; 4.30 p.m., temp. 100 2-5ths, pulse 140; 10 p.m., temp. 99 2-5ths, pulse 114. Tuesday, May 13th.—Temp. 10 a.m., temp. 100 2-5ths, pulse 140; 7.30 p.m., temp. 100 3-5ths. After this no accurate observation was recorded.

Department of Lunacy.

PROFESSIONAL RESPONSIBILITY.

A CASE involving an important medical issue came under the consideration of the Marylebone County Court on the 24th ult. Dr. Edwards, of Hyde Park, was consulted in reference to a lady who had been of unsound mind for a year, and in whom the symptoms were rapidly increasing, and, in addition to the mental excitement, she practised self-abuse to such an extent that an ulcerated mass had formed around the labia and clitoris from the introduction of certain foreign bodies into the vagina. This diseased tissue, acting as an irritant, excited a desire to masturbate, and Dr. Edwards, after consultation with Dr. Alfred Meadows, decided to remove it. He informed the family of the nature of the proposed operation (which was not, however, clitoridectomy). As a result of the operation the masturbation ceased, and the patient improved in every respect, both mentally and bodily. Some time after it was decided to place her under certificate in a private family, Dr. Edwards visiting her once a fortnight, and acting as her medical attendant, under the Lunacy Act. He continued his visits until it was found desirable to transfer the patient to an asylum. Fees had been paid from time to time, and the patient, now passing out of the care of Dr. Edwards, the amount of his claim up to this time, which had been previously agreed to by the family, was naturally sent to the relatives. To his astonishment, it was disputed, and a counter claim set up by the solicitor of malpractice in performing the operation, and so causing the patient to become chronically insane. No mention of this was made until after a lapse of one year from the operation, when notice of it was given to Dr. Edwardes through a solicitor. At the hearing of the case the chief questions which arose were what the effect of such an operation upon the mental state of a person would be, and whether it would be justified by the circumstances of the case. Many medical witnesses were in court prepared to testify as to the propriety of the operation. The judge evidently from the first entertained a strong opinion. Dr. Meadows was called and sworn, but the solicitor threw up the case, which, in our opinion, ought never to have been brought into court. Dr. Edwards had done everything in his power for the patient committed to his charge. He had not performed any operation without first consulting with Dr. Meadows, and after communication with the family. He had acted quite professionally, and the Judge endorsed this view in the highly complimentary manner in which he addressed him at the termination of the case.

RESTRAINT IN INSANITY.

WE have received a very comprehensive and interesting pamphlet by Dr. Bodington on the above subject. He is an advocate for restraint, and endorses the opinion so often expressed by some authorities that it is far better to adopt restraint in cases of acute mania than to allow the patient to struggle violently. There is much truth in what Dr. Bodington says, that where the "non-restraint system" is adopted much cruelty and brutality is liable to be practised by the attendants as soon as the superintendent's back is turned. We are reminded that scarcely a week passes without reading of the "ill-treatment of a lunatic." This is generally the case when the "non-restraint system" is carried out and the patient struggles. Dr. Bodington's views are, that mechanical restraint is humane and safe, because its instruments are free from caprice, temper, "impatience, irritability, vindictiveness, passion, or tyranny, because they can neither threaten, strike, nor throttle, nor kneel on the chest, nor crush the ribs, nor shatter the breast-bone. Thus, mechanical restraint is, as now contended, not only a humane and safe means of protecting the patient, but it is calculated to obviate and abolish the cruelties and brutalities that spring out of the practice of manual restraint."

It is not generally known that mechanical restraint is

Digitized by Google

still adopted to a considerable extent in the asylums of Jersey and in some of the institutions in France, especially in a large asylum situated at Dinan, on the coast of Normandy. Restraint, if used with moderation, is useful in some instances to protect patients from the violence of attendants, and which frequently cannot be avoided in states of excitement. Nevertheless, it is open to great abuse when left to attendants who, as in France, are at liberty to use it at their discretion.

CHLORAL HYDRATE IN THE TREATMENT OF INSANITY.—Two cases of considerable interest connected with the administration of chloral have recently come under our observation. In one instance the chloral was taken in one dose of 200 grains, and in the second case in four doses of 60 grains each at intervals during the day. In the first instance symptoms of coma instantly supervened, whilst in the latter those of acute mania gradually followed after the last dose had been taken, both ultimately ending in complete recovery. We have also had under our observation patients who suffered from "chloral mania," where the craving was as excessive as it is in obstinate dipsomania. We regard such cases as incurable.

THE SIZE OF THE BRAIN.—M. Broca has been investigating the size of the brain in the two sexes. According to him, the brain of women, and consequently their intellectual faculties, are not only inferior to those of men, but the difference tends to increase with the progress of civilisation. M. Gustave Lebon, writing on the same subject, remarks that if the relative inferiority of the brain of women of the present day is more marked than it was in the prehistoric period, the brain of men has also become inferior to that of their prehistoric ancestors. He states that the skulls found in the "Caverne de l'Homme Mort" measured, according to M. Broca himself, 1,606 cubic centimetres in men, and 1,507 in women, the difference being 100. In contemporary Parisians the male skull measures, on average, 1,558 cubic centimetres, and the female skull 1,337, the difference being 221. This difference of the human brain is not only confined to the sexes, but it increases between the inferior and superior races. In men and women of the same height M. Lebon says the difference is 172 in favour of the male brain.

CIRRHOTIC INDURATION OF LUNG—SUPERVENTION OF CAPILLARY BRONCHITIS IN OPPOSITE LUNG—REMARKABLE VASCULAR ENGORGEMENT OF CEREBRAL HEMISPHERE.

By BEVAN LEWIS, L.R.C.P. Lond.,
West Riding Asylum, Wakefield.

A. H., æt. 39, admitted suffering from an attack of excitement, with delusions. The mental symptoms presented nothing very unusual. Upon physical examination the left lung was found to be consolidated, and she was in a greatly reduced condition. It was ascertained that she had been intemperate, and had lived a dissolute life.

Shortly after admission she developed symptoms of acute bronchitis of the capillary form. The dyspnœa became most urgent and distressing, and the expectoration copious and muco-purulent. Evidence of most serious circulatory obstruction was afforded by the unusually deep cyanotic aspect of the face, the rapid development of anasarca, the puffy eyelids, and local œdematous infiltration over decumbent parts. There were no profuse sweats, and the temperature rarely rose above 100° Fahr. This condition was maintained unrelieved for a month, during the whole of which period her mental condition was one of constant and profound torpor. She could only momentarily be roused to reply to questions, and then immediately sank into a semi-comatose condition. On one occasion she was bled to the extent of eight ounces with only temporary relief to the urgency of her symptoms. Occasionally the distress of breathing was alleviated for a few hours, and then it was found that she was perfectly clear and rational as to her mental state. She died two months after admission.

It was found upon post-mortem examination that the left lung was firmly adherent posteriorly by old fibrous bands, was shrunken, collapsed, and had undergone fibroid induration. It sank in water, and weighed but 358 grammes. The right lung gave evidence of acute bronchitis. As regards the brain, it was found that throughout the whole of the left hemisphere the vessels of the white matter were enormously distended, and so closely aggregated as to assume the appearance of thousands of miliary hæmorrhages. All parts of the white matter and the ganglia at the base were similarly involved. Here and there distinct hæmorrhages had occurred, and the coalescence of two or three miliary hæmorrhages had apparently ensued. The same condition was observed in the right hemisphere, with the addition of distinct white softening of the medullary portion of the occipital lobe. The cortex was free from lesions, but was greatly injected. The cerebellum showed similar conditions to the cerebral hemispheres.

THE FUTURE OF HYGIENE.

THE Parkes Museum of Hygiene, which has just been thrown open to the public, has a much greater significance than most people are aware of. It is one of the signs of the times we live in. It points to a goal which we are all endeavouring to reach, although we may not succeed in the attempt; and it is one phase of a movement which is highly creditable to the wisdom and foresight of those distinguished sanitarians who have done so much towards establishing hygiene as a science, and gaining for it the respect and support of the State. We purpose, therefore, to leave for a while medical reform and select committees, and college elections, and all that, to speculate on a subject in which people of all shades of opinion should feel no little interest. It is not well

Digitized by Google

to keep the mind too much bent upon theevents of the passing hour, as the use we make of the present will be the more profitable the more we think of the possibilities of the future.

If we take a comprehensive view of what has been called preventive medicine, we shall be disposed to regard it as one of those minor evolutionary forces which, physically speaking, may have, or are even now having, no little influence over the destinies of mankind. The doctrine of evolution, which has been so laboriously worked out by one of the most gifted scientists of the present day, and which has met with the approval of the bulk of the medical profession, has not even, in a humanitarian point of view, deserved all the abuse which has been heaped upon it. This doctrine, as the reader well knows, teaches us that all the higher species of animals, including man himself, have not been distinct and separate acts of the Creator, but are the results of a gradual and more perfect development of the lowest forms of animal life; that the structure of living beings became in the course of time more complicated and more perfect in form and in function; and that this evolution, which has been the work of countless ages, is still going on. Now, admitting for the moment that evolution is something more than a mere theory, that it is beyond dispute a law of Nature, the question that will probably occur to most thoughtful minds is, Whether this evolution has, in man, in his present state, reached its acme of perfection? whether, in fact, it has now gone as far as it can go, or whether there is not, in virtue of a still higher development, a brighter future before mankind, a future in which man's physical, moral, and intellectual well-being is far above what it has been, or what it is now? To this question the theologian may answer "Yes," and then he will perhaps add, "but it must be in another world." The naturalist, however, who equally with the divine may think that with God all things are possible, does not despair of this world becoming the abode of a superior and more happy race of beings than that by which its most civilised portions are now inhabited. If we contrast the past with the present, we shall be warranted in saying that this evolution towards a higher standard in the physical and moral condition of mankind has already made a beginning. The gradual removal of the more active causes of disease; the average increase in the length of human life; the diminution of pauperism and crime, even under conditions most favourable to pauperism and crime; the education and social improvement of the poor; the remarkably humane feelings which now obtain not only between man and man, but between man and beast; the greater reluctance which nations now show to submit their quarrels to the arbitrament of the sword; these maybe a sign that man is still in some measure subject to that law of progressive development which has hitherto characterised the animal creation.

Among the agencies now at work in effecting an improvement in the physique, and even in the intellectual and moral status of our race, hygiene may occupy a high position. Hygiene has been very aptly defined as the "art of preserving health, of prolonging life, and of showing how the human species may be perpetuated and developed in the greatest perfection." The prospect, therefore, which lies before it is magnificent and immense. The advancement of this science is undoubtedly the most admirable outcome of modern medicine. From a utilitarian point of view, and with regard to the possible effects upon the future of mankind, all other departments of medicine are, comparatively speaking, insignificant. Indeed, it must be admitted that, with the exception of operative surgery, curative medicine is, comparatively speaking, a failure, and the general consciousness and tacit admission of this fact is one reason why hygiene has made so much progress within the lastfew years, and is now attracting so much attention both from the profession and from the public.

Hygiene was not altogether neglected by the ancients, as the works of Hippocrates will show. But it is only within a recent period that it has been studied as a distinct science or has had any marked effect upon the health and mortality of the people. For a long time the profession did not attach much importance to the old adage that "prevention is better than cure." Preventive medicine was almost wholly ignored by them, while their treatment of disease was of so heroic and perturbating a nature as to expose the science of medicine to ridicule and contempt, and to lead to a reaction which is, perhaps, as culpable as the practice it displaced. We may, however, say that in England the first rudiments of the science of hygiene begun with the rude measures of prevention which were adopted during the plagues and epidemics of the 16th and 17th centuries. At a later period we have Howard purifying the jails, Jenner discovering vaccination, and Sir George Baker the cause of Devonshire colic; while it first took its position as a branch of study by the State, when the first great and comprehensive measure, the groundwork of sanitary legislation, was passed, namely, the Public Health Act of 1848.

Since then, Hygiene has done great things among all classes of society, in various spheres of human industry, and in all departments of the public service. As Dr. Guy well observes:—"It follows the child to school; the labourer and artisan into the field, the mine, the factory, the workshop; the sick man into the hospital; the pauper into the workhouse; the lunatic to the asylum; the thief to the prison. It is with the sailor in his ship, the soldier in his barrack, and the emigrant in his new home beyond the seas." Yet, if from a theoretical point of view we contemplate the possible results of the progressive advancement of this science, we can only regard t as being at present in its infancy. Plenty of pure water and pure air for the poorest in the land, a clean and healthy home for every one, and temperance in every home; no larger populations than the means of subsistence are able to support; the physical pains and miseries of mankind reduced to a minimum; disease of rare occurrence; premature deaths chiefly the result of accident; longevity increased; physical and mental health—the *mens sana in corpore sano*—the birthright of all; and the gradual development of a race of men as physically, mentally and morally superior to us as we are to the lowest savages of whom we have any knowledge—this is a dream of the sanitarian, the realisation of which is far from being impossible. It must, however, be admitted that the obstacles to be overcome before this Utopian

Digitized by Google

age can be reached are as difficult as the prospect is enchanting. The deadly legacies left to us by our forefathers—hereditary disease, must be cancelled or effaced, the lust of power, and the lust of wealth must be kept within due bounds, the bonds of sympathy between the rich and the poor must be of a closer nature than they are now, many bad and inveterate habits must be reformed, and many long-standing prejudices overcome. Education, in the widest sense of that term, must be universally extended; the laws of health must be the future catechism of the child; and every individual must be to himself or to his offspring what a conscientious officer of health should be to society at large. We are, unfortunately, too often reminded that it is one thing to teach the public, and another to get them to practise what is right. It is now many years since Jenner showed mankind how small-pox might be entirely stamped out. That if the practice of vaccination and re-vaccination were thoroughly and generally carried out this disease would come to have only an historical interest, is a truth almost as certain as a mathematical axiom. And yet it is only lately that this country was visited by a great and very fatal epidemic of small-pox; and even now a well-organised society is doing all in its power to prejudice the public against vaccination. The prevalence, moreover, of temperance among all classes of society, the regulation of the passions, and the rooting up of all those dirty habits which have in all ages and in all countries characterised the persons and dwellings of the poor, and which are such a prolific source of disease—all this must be necessarily a work of time.

Then, again, while there are many diseases which the sanitarian has proved to be preventible, and the occurrence of which is to be entirely imputed to the improvidence of man; there are also many and fatal diseases, the causes of which are still obscure, but which future investigations may show to be equally preventible.

Independently, moreover, of these and other obstacles to "man's estate" being cultivated to the extent to which it is capable, and which are more or less under his control, he may have to contend with influences over which he has no control whatever. We allude to those conditions of his environment which he can neither foresee nor prevent, and can only partially resist. Hitherto, man's environment has only slightly and partially interfered with the development of his species, while, according to the views of Darwin and his followers, external physical causes have, in conjunction with the so-called laws of heredity and adaptation, greatly contributed to the development of the rest of the animal creation. Are we sure, therefore, that the physical changes through which this globe is destined to pass, and is, indeed, now passing, will be as favourable to the future development of the human species, as they have been in ages gone by? May they not, on the contrary, be such as to prove a barrier to any great advancement in the physical and moral condition of mankind? We hope not; but still these are contingencies which should not be lost sight of by those who would speculate on the future of humanity. As for thousands of years the various cosmic agencies which have been at work, have rather fostered than interfered with the gradual evolution of the human species, so we hope that for thousands of years yet to come man is destined to receive at the hands of his Creator a still higher development. Nor can we, in conclusion, expect that the laws of "natural selection" and of "heredity" can in our case operate to the extent they have operated in the evolution of the animal world. Natural selection has doubtless been a great factor in the origin of species, but its free operation in respect of man is beset with a thousand counteracting influences. How these influences, these disturbing causes, can be best removed, and how the principles of natural selection, adaptation, and heredity can be brought to bear upon the more perfect perpetuation and developement of the human species, is one of the most difficult problems the hygienist will have to solve. That, however, the problem may at last be solved, we may entertain some hopes, and at all events it is a problem to the solution of which we may all legitimately aspire.

Notes on Current Topics.

The Habitual Drunkard's Bill

has passed both Houses, and needs only the Queen's assent to make it law. It is an admirably conceived measure, and most creditable to Dr. Cameron, its author.

Appropriately to the occasion we may quote a statement made by Dr. Crothers, the Secretary of the American Association for the Cure of Inebriates. Dr. Crothers says:—

The narrow prejudice and ignorant opposition have only served to bring out more prominently the principles upon which Inebriate Asylums are founded, and behind all the clamour and sneer there is an under current of facts (increasing every year) pointing distinctly to these asylums for a solution of the many problems of inebriety.

Of over thirty inebriate asylums established in this country during the past quarter of a century, only four have suspended and gone out of existence.

Considering that they were all experimental, and working without experience or precedent, and without the sympathy and co-operation of the public, their success may safely challenge comparison with any other charity of the age.

It is a well recognised fact that the asylum treatment of inebriety is more difficult than that of insanity, and had these asylums not met a necessity as imperative as quarantine stations for infectious diseases, or hospitals for the insane, they would have all failed long ago.

Within two years a very significant movement has begun, which is the commencement of a great revolution of public opinion in regard to asylums.

There has been opened in this country within this time over a thousand temporary lodging houses and eating rooms for inebriates—places where the poor, homeless victim, after he has signed the pledge, can be taken and cared for until he is able to go out sober, and help himself.

Some of these places have five or six beds, others less. Most of them are free. Some charge a few cents and trust the inebriate to pay. Many of them are connected with temperance coffee rooms, and are scarcely known. Some of the temperance eating rooms have the names of benevolent persons who will give a room and bed to any poor worthy inebriate who is making an effort to get well.

The value of one day's restraint in these homes will bring the most positive proof of the greater good coming from a longer time, with more perfect care and attention.

If good food and quiet rest will help to overcome the

Digitized by Google

diseased impulse, it is only a step to realise the value of months of such surroundings, and the possibility of permanent recovery.

These homes are rapidly increasing, and following the track of the great revivals, and they are literally the first efforts of the masses to treat inebriety by rational means. From every one will go out an influence that will far transcend the individual good they can accomplish.

This is undoubtedly the beginning of a great inebriate asylum movement, which shall provide hospitals and homes for this class.

The public are ripe for some practical methods of reaching this disorder. A small number of asylums are at work, like the videttes of an advancing army. Practical men, both in and out of these asylums, recognise the possibility of making all this vast tide of inebriety support itself in hospitals sustained by law and public sympathy. All the indications are unmistakable, that behind this noise and confusion will be seen the reign of law and growth of homes and hospitals that shall meet the demand of the inebriate. The medical profession are also agitating this subject, and from all sides come the most cheering proofs that the work of our Association is scarcely begun.

The New Infirmary at Holloway.

The opening, last Saturday, of this institution by the President of the Local Government Board, was an important event, considering how much general hospitals are wanted in some quarters of the meiropolis, and that the hospital in question has cost upwards of eighty thousand pounds, and has room for six hundred and twenty beds. It is to be hoped that before long more general hospital accommodation will also be provided for the crowded districts of the Eastern and other portions of the metropolis. It is well known that in the large populous districts stretching on all sides towards the suburbs of London, there are but four general hospitals, only one of which—the London Hospital—can be called a large one. We need scarcely remark how much hospital reform is just now attracting the attention of the profession, and of those outside the profession who are interested in the administration of our great public charities. Hospital and dispensary relief is at present in a transition state. The gravitation of hospitals and dispensaries towards the west and more wealthy portion of the metropolis, the unnecessary increase of special hospitals, the overcrowding of the out-patient room, the want of selection in affording relief, and the dearth of providing dispensaries, these are some of the evils to which attention is now being very properly directed. One great question connected with this subject is, Should we look for any assistance from the State? Or are the governors and managing committees of the various hospitals backed up by the help of the press and the parties or associations which have specially interested themselves in the matter, alone sufficient to cope with the difficulties in the way of effecting a thorough and efficient reform in the administration of our medical charities? The subject is being taken up not only by the medical, but also by the lay, press, and no doubt decided steps will soon be taken to remedy the evils complained of.

The ceremony of laying the first stone of the new wing of the Royal Hospital for Incurables, West Hill, Putney Heath, by the Prince and Princess of Wales took place yesterday.

Three Deaths from Sewage Poisoning.

The alleged death of three boys from sewage poisoning is rather a startling revelation in these days of sanitary inspectors and medical officers of health. The evidence showed that the deceased boys were suddenly taken ill with pains in the head and vomiting, and died after a few hours' illness. The local medical men were unable to determine the cause of death, and the coroner accordingly communicated with the Home Secretary, who made an order for two experienced pathologists to make a post-mortem examination and analyse the stomachs. Dr. Thomas Stevenson, of Guy's Hospital, examiner in forensic medicine and chemistry, said he had submitted the contents of the stomachs to a chemical and microscopic examination. He found no vegetable or other irritant poison, and there was nothing to account for the cause of death. Mr. Thomas Bond, lecturer on forensic medicine at the Westminster Hospital, said that a post-mortem showed an entirely negative result as to poison having been swallowed by the boys. He was of opinion that the cause of death was blood poisoning from the sewage. He had examined the earth closets, and found them in a very bad condition. We should think they must have been in a very bad condition, and it is certainly a remarkable coincidence that three boys should have been simultaneously taken ill, and all three died from the effects of sewage poison. We suspect that the sanitary surroundings of the poorer inhabitants of North Hyde, Heston, cannot be very good, and it is to be hoped that the medical officer of that district will remove the suspicion, which will be naturally attached to its sanitary condition, by issuing a satisfactory report of the other parts of the district.

An Athlete's Maxim on the Preservation of Health.

It appears that the great Canadian sculler, Hanlan, has been giving a correspondent of a daily newspaper his opinion of the most profitable way (in a health point of view) of passing one's existence. In the first place he very wisely eschews both alcohol and tobacco, which for the last three years he has entirely foresworn. "I eat," he also says, "wholesome food, take regular and moderate exercise, avoid violent exertion, and generally strive to cultivate a cheerful state of mind, in order that sweet sleep may follow my daily work." His advice with regard to drinking and smoking is unexceptionable, and well would it be were it followed by every one of his class. It should, however, be borne in mind that he is a Canadian, and if there is any country in the world where alcoholic stimulants are unnecessary, and even injurious, to health, that country is Canada. Were Hanlan to live long in this trying climate, of which we are now having such a dismal illustration, we suspect that he would rather alter his opinion on the alcoholic question, and make some allowance to the working classes of this country on account of the climatic temptations to which they are exposed. The best point of the great sculler's utterances is the importance he attaches to "a cheerful state of mind." There can be no doubt that this is frequently the secret of people enjoying good health; but then, on the other hand, it is as often a *symptom* as a cause of good health. If we were asked what frame of mind is most conducive to health

Digitized by Google

and longevity, we should say that equanimity, which Horace so well decribes when he says,

"Sperat infestis, metuit secundis,
Alteram sortem bene præparatum
Pectus."

This is a frame of mind which we may all endeavour to preserve whether we are ill or well.

The Abuses of the Patent Medicine Trade.

At the last meeting of the Council of the Pharmaceutical Society of England, one of the members of the Council moved to refer to a committee the wide-spread abuses of the patent medicine trade. He said it was evident to all that the sale of poisons under the cover of the patent medicine stamp was a growing evil. He heard the other day that a grocer's assistant was asked what was the dose of chlorodyne, and replied a tea-spoonful. When the Pharmacy Act of 1868 was obtained, it was to all intents and purposes an Act for regulating the sale of poisons, but if anyone were able to sell poison upon affixing a patent medicine stamp to it, evidently the Act was of little or no use. He was told that in the country wholesale houses sent out two-ounce bottles of laudanum by the gross with a stamp on, and that opium itself was also sold in this way. Tincture of aconite was sold by grocers under a stamp, and in fact if any adventurous quack chose to put up the dilute hydrocyanic acid of the Pharmacopœia, under a stamp, and say that two or three drops were to be taken in water in case of sickness, it might be done with impunity. The time had come when this matter should be considered, for it was never intended that grocers, tailors, and others should become the vendors of poisons. If the spirit of the Act were to be carried out, those who knew something about medicines should alone sell these things. The very fact that a person had to go into a special shop in order to purchase a poison was to a certain extent a safeguard; but if people were able to get it at any ordinary shop, the use of poisons would become so indiscriminate that a Parliamentary commission or inquiry would be the probable result.

The Spermatorrhœa Trade in Australia.

In the *Australian Medical Journal* for December 1878, just received, appears an amusing and instructive correspondence in reference to the removal of Dr. Blair's name from the lists of the Medical Society of Victoria, Australia. Dr. Blair, it appears, was placed in charge of the practice of Mr. J. G. Beaney, during that gentleman's absence in Europe, that fact being notified to the public by advertisements and circulars. Thereupon, a person who signs himself Henry Herbert Saunders, and hails from Dunedin, in New Zealand, writes to Dr. Blair, detailing his suffering from all the symptoms of spermatorrhœa, and asking for secret advice. To his note he receives reply from Dr. Blair, requiring, as is usual in this line of business, a sample of urine and a preliminary analysis fee of £3 3s., to which Saunders responded by sending—not his own urine, *but a mixture of thirty drops of the urine of a perfectly healthy old lady aged sixty-four*, with a small bottle of water. His answer from Dr. Blair states that he had made "a careful examination, with the result of satisfying himself that the case will require careful and prolonged treatment," and that his fee would be *sixty-five pounds*.

This correspondence, together with a packet of medicine directed in Dr. Blair's handwriting, having been forwarded by Saunders to the Medical Society, Dr. Blair was asked for an explanation, and at once resigned his membership of the Society after a debate deciding to let him go. The affair goes a long way to illustrate the method by which money is made by a certain class of practitioners in Australia and elsewhere.

A Psychological Plea.

The defence made by the clergyman who has just been found guilty of assaulting his servant, a girl of sixteen, is enough to draw a smile from the psychologist, who is perhaps not aware of the ingenious manner in which one of the facts of his science may be turned to account. The defendant had no witnesses—the assault being declared to have taken place on a night when his wife was away from home—and he was thus driven into a speculative defence, with the object of accounting for the delusion under which the prosecutrix laboured. In the first place, he alleged that the girl was a somnambulist, and next that, being thus subject to "unconscious cerebration" of a powerful kind, she dreamed the events to which she had deposed. Instances are not unknown of dream incidents leaving a vivid impression of reality upon the waking brain, and it is just possible that a charge of this kind might be brought against a perfectly innocent person. The defendant took advantage of what little he knew of cerebral physiology, but the jury did not give any credit to the plausible theory he set up, and the consequence was, he has been sentenced to twelve months' hard labour.

Conversazione at the Royal College of Physicians.

The *conversazione* at the Royal College of Physicians is one of those entertainments in which many of the Fellows and their friends find an agreeable relaxation from the work which their professional engagements impose upon them. As it is, the bow of the medical practitioner is not so often unstrung as it ought to be, and were it not for this and other ways of diverting his thoughts from the current in which they have been running all day, his health would inevitably suffer from that mental strain which incessant occupation would necessarily entail. We therefore generally find that there is always a very good assembly on these occasions, and that if some of the gentlemen who are invited stop away, it is because some other engagement of business or of pleasure has a prior claim upon their attention. Although the *conversazione* was well attended, there was, perhaps in consequence of the inclemency of the weather, an absence of that heat and oppression which are usually felt on those occasions. Among the guests who were introduced to the President, Dr. Risdon Bennett, we noticed Sir Thomas Watson, Sir W. Gull, Sir Henry Thompson, Sir James Paget, Mr. Erichsen, Dr. Sieveking, Dr. A. S. Stewart, Dr. Harrington Tuke, Dr. Crichton Browne, Drs. Wilks, Dickenson, Russell Reynolds, Bristowe, Wilson Fox, &c. Among the articles exhibited, a series of micro-photographs

Digitized by Google

attracted much attention. These were arranged as transparencies on a screen, and illustrated various stages in the development of blood corpuscles. Dr. Richardson exhibited his improved sphygmograph and Professor Hughes's audiometer. There were also several other novelties of a scientific or medical nature, numerous microscopic preparations, and several interesting oil paintings and water-colour drawings.

Poisoning by Calomel.

Dr. A. Brochin lately communicated to one of the French medical societies the case of a patient who was nearly poisoned through taking by mistake a large quantity of calomel. The patient was a young woman who, in consequence of a slight sore throat, went to a chemist for some *pastilles* of chlorate of potash. Instead of chlorate of potash, these pastilles contained calomel, of which she took so large a quantity that for months she was in imminent danger of losing her life, while her constitution has been so damaged that it is doubtful whether she will ever be able to resume her ordinary avocations. We cannot here give the details of this interesting case; suffice it to say that it shows how careful chemists should be in dispensing medicines, with regard to which any mistake may arise. Pastilles, lozenges, and similar preparations are certainly very convenient and palatable forms of exhibiting medicines, but they are preparations in the dispensing of which much caution should be exercised.

Medical Students before the Select Committee.

The *Students' Journal* puts in a claim that a representative medical student should be heard in evidence before the Select Committee, and suggests a public meeting of students for the purpose of organisation. The proposition will no doubt be received with obloquy by the Medical Council party, and by the highly respectable gentlemen who consider themselves "the leaders of the profession," but to us it seems to be a practicable and useful suggestion. The views and interests of medical teachers, qualifying bodies, or medical reformers—all of whom will be heard before the Committee—are by no means identical with those of the students, and we are conscious that an intelligent and observant student would be able to tell the Committee much which it is not likely to hear from these classes of witnesses. For instance, no one could speak as to the reduplication of lectures, or as to the want of classification of students for teaching purposes, with so much force as a student; and no one could give more useful hints regarding the amendment of methods of examination than he whose whole mind was devoted to that subject. The difficulty would be to find a student who was competent to speak to anything beyond the limit of his own little world, and the necessity which would arise for examining a witness from the schools of each division of the kingdom. Nevertheless, the proposition strikes us as being worthy of consideration.

The annual distribution of prizes to the students attached to St. Thomas's Hospital will take place to-morrow, at 3 o'clock; Mr. Alderman McArthur, M.P., has kindly undertaken the duties.

The Palatable Administration of Castor Oil.

Castor oil is such a valuable aperient that we are surprised that pharmaceutists have not discovered some effectual means of disguising its disagreeable flavour. Taking it in the form of an emulsion, in capsules, and on the surface of coffee, spirits, hot milk, &c., have all been tried, but none of these methods is quite satisfactory. Owing to the bulk of the medicine it is inconvenient and indeed difficult to form it into ordinary sized pills, and consequently the so-called castor-oil pills contain very little of that medicine, and are often adulterated with croton oil. Dr. Starke, of Berlin, recommends (*Berlin Klin. Wochenschrift*) the oil to be mixed with coarse brown sugar until a thick paste is formed, a little cinnamon powder being added to give the mass a pleasant taste. He finds this plan uniformly successful with children. To adults he gives the oil in the form of a bolus, made with one part of compound liquorice powder to two of oil.

Effects of Inhaling the Oil of Turpentine.

In order to determine the physiological and pathological effect of inhaling this drug, M. Poincarre (in a paper read at the French Academy) examined and interrogated 282 workmen who were constantly in contact with it in the course of their work, besides which he kept for seven, eight, twelve, and sometimes sixteen months, animals in a place strongly charged with vapour of turpentine. The symptoms complained of by the workmen were, headache, unsteadiness of gait, irritability of temper, a feeling of pricking in the eyes, shedding of tears, feebleness of vision, especially in artificial light, frequent attacks of coryza and of cough, granular irritation of the pharynx and larynx, vomiting, and various complaints in the stomach. After a time, however, these symptoms were only noticed when the hours of work were prolonged, or the workshop badly ventilated. Some men were obliged to take to another occupation. The physiological effects of inhaling the drug are of a transient nature, and appear to be incapable of causing any serious disease. With regard to the experiments which were made on animals, nothing very remarkable occurred unless they inhaled sufficient turpentine to cause death.

The results obtained by this investigation scarcely compensated for the trouble taken by M. Poincarre in making it. As a rule, experiments made with drugs on healthy animals do not afford much information as to their therapeutical action in states of disease. There are reasons for believing that the inhalation of turpentine is beneficial in certain forms of phthisis, chronic bronchitis, &c., although in a healthy subject its inhalation may only give negative results. That small doses of turpentine will arrest hæmoptysis and some other forms of hæmorrhage, will not be disputed by any one who has had experience of this drug in these cases, but we doubt whether physiological experiment will throw much light upon the *modus operandi* of turpentine as a hæmostatic agent.

The School Board and Moral Education.

It will be generally admitted that, if the health and social condition of the working classes are to be improved by the compulsory education now in

Digitized by Google

force, moral teaching must go hand-in-hand with instruction in the subjects ordinarily taught in schools. It was, therefore, well that, at a recent meeting of the School Board at Birmingham, the Education Committee submitted a draft circular to teachers respecting moral instruction. It was recommended that, after midsummer, two lessons a week of half an hour each be given to the children, the subjects including obedience to parents, honesty, truthfulness, modesty, temperance, courage, kindness, perseverance, frugality, thrift, government of temper, courtesy, unselfishness, and kindred moral duties. The lessons were to be of a conversational character, and should be enforced by illustrations drawn from daily life. After a long discussion, it was decided by nine votes to four to send the circular to the head masters and mistresses of the Board schools.—We should not only advise that this plan be adopted at all the Board Schools, but that a similar system be carried out with regard to the instruction of the children in the first elements of sanitation, such as might be taught by a short catechism on the subject of cleanliness, exercise, pure air, early rising, food and clothing, temperance, &c.

Action of Cholagogues.

Among the conclusions arrived at by Prof. Rutherford, from his experiments on the cholagogue action of remedies, are the following :—That castor oil, croton oil, sulphate of magnesia, chloride of ammonium, sodium bicarbonate, potassium bicarbonate, &c., have no effect on the biliary secretion ; that taxracum, colchicum, aloes, rhubarb, senna, jalap, sulphates of potash and soda, &c., are feeble cholalogues ; and that podophyllin, enonymin, sanguinarin, ipecacuan, colocynth, sodium phosphate, nitro-hydrochloric acid, the benzoates of sodium and ammonium, sodium salicylate, and corrosive sublimate, are decided cholagogues. Enonymin (a resin from *Enonymus atropurpurens*) in doses of two grains, sanguinarin (¼ to 1 gr.), iridin (1 to 5 gr.) sodium benzoate and salicylate (10 to 20 gr.), and ammonium phosphates seem to be the drugs best capable of increasing the secretion of bile. It may, however, be questioned whether we can place much reliance upon the conclusions that are drawn from experiments upon the lower animals with respect to the action of certain drugs upon the human liver. With the exception that little or nothing is said about the cholagogue action of calomel or blue pill, there is scarcely any fact above-mentioned that has not already been established by clinical evidence. Secretion of bile, however, is only one of the functions of the liver, and no doubt there is still much to learn about the action of remedies upon this important gland—much too, that may be learnt from such excellent researches as those which Dr. Rutherford has so ably conducted.

Hypodermic Injection of Morphia in Asthma.

M. Huchard having (says the *London Medical Record*, March, 1879) carefully studied the effects of, and objections to, the use of morphia in asthma, has come to the conclusion that in the most intense attacks of asthma the hypodermic injection of morphia will cause immediate relief. He even goes so far as to affirm that if these injections are repeated, they will, by cutting short each attack at its beginning, succeed in rescuing the economy from this spasmodic habit, and thereby cure the disease. With regard to the different forms under which asthma can show itself, he compares pathological facts with the results which have been obtained from the therapeutical study of preparations of morphia, and in this way succeed in explaining facts which he had learned empirically from clinical experience. In another part of his work M. Huchard recommends the hypodermic injection of morphia in other cases of dyspnœa, such as cardiac asthma or uræmic dyspnœa ; and he also dwells upon the different results produced by morphia preparations according as they are given hypodermically or by the mouth. He sums up his exhaustive study of the subject by remarking that morphia makes one breathe freely.

It is very probable that partly from fear of checking the bronchial secretion, and partly from fear of the drug acting injuriously upon the brain and respiratory centres, morphia has not been given so freely in asthmatic attacks as it might be, stramonium, datura tatula, and one or two other medicines being the favourite remedies. We should therefore advise those who have much to do with this disease, which is as troublesome to the doctor as it is distressing to the patient, to follow M. Huchard's advice, and in certain cases to give a fair trial to the hypodermic injection of morphia.

Murchison Memorial.

The two Murchison Memorials are now blended into one. The amalgamation took place on the 30th June, at a meeting presided over by Dr. Risdon Bennett, President of Royal College of Physicians. A Clinical Scholarship has been decided upon as the main part of the scheme. This is to be awarded alternately in Edinburgh by the University of Edinburgh ; and in London (it is anticipated) by the Royal College of Physicians, open to students of all metropolitan schools. £300 of the sum collected is to go for a local memorial, such as a bust, at St. Thomas's Hospital. It is expected that about £2,000 will be raised. The Executive Committee are the following :—Mr. Lister, Dr. Burdon-Sanderson, Dr. Quain, Dr. Farquharson, Dr. Rolfe, Mr. Chilton, Sir Joseph Fayrer, Mr. Sibley, Dr. Bristowe, Dr. A. P. Stewart, Mr. T. D. Acland, Dr. Van der Byl, Mr. Hyde Hills, Dr. Russell Reynolds ; with Dr. Dyce Duckworth and Dr. D. Greenfield, Hon Secs., and Dr. Potter, Hon. Treasurer. Subscriptions will be received by either of the Hon. Secs. or by the Treasurer.

Vivisection.

For the enlightenment of the general public, and in order to avoid all possibility of such legislature interference as in England, the authorities of the medical faculties in the universities of Basle, Berne, Bown, Dorpat, Erlangen, Freiberg, Halle, Heidelberg, Leipzig, Prague, Vienna, &c., have united in issuing for general circulation and instruction, a card defining what is meant by vivisection, and citing a few of the chief physiological and pathological advances which have directly and indirectly resulted from the prosecution of this plan of investigation.

The late Dr. Tilbury Fox.

At a meeting of the Board of Management of St. John's Hospital for Diseases of the Skin, held on July 1st, the following vote of condolence was unanimously passed :—

"The Board of Management of St. John's Hospital beg to express to Mrs. Tilbury Fox their deep sympathy with the irreparable loss she has sustained by the death of her husband, who was one of the earliest medical officers of the hospital. They regret the early death of one who had already done so much for pathology, and to whom so brilliant a career had opened. They trust that this expression of sympathy for her loss and that which dermatological science has sustained will be accepted in that kindly feeling which has suggested it."

The Home Secretary, very wisely we think, has instructed the police to keep an eye on such establishments as advertise to receive infants. There is unquestionably a good deal of slow child murder carried on unobtrusively in some of these "homes."

A grand fancy fair is now being held at the Royal Albert Hall in aid of the funds of the French Hospital in London. The Prince of Wales and other members of Royal family have visited the fair, which if sufficiently successful, will enable the committee to increase the accommodation of the hospital.

Bad weather appears to be general from all points of the compass. By telegram we learn that a tornado has passed over the States of Iowa, Minnesota, and Wisconsin, by which twenty-five persons were killed, many buildings destroyed, and the railway traffic interrupted.

Dr. Thorne Thorne, in his official report to the Local Government Board on the recent outbreak of enteric and scarlet fevers at Penistone, expresses a decided opinion that the conditions so well known to be associated with the prevalence of enteric fever, namely, conditions favouring the excremental poisoning of air breathed or of water drunk, are very widely prevalent in Penistone.

Dr. W. J. Hepburn, of York Street, Dublin, was last week elected to the Vacant Surgeoncy of the Meath Hospital, Dublin, in room of the late Dr. Robert Persse White. Dr. Hepburn is a Fellow of the College of Surgeons of Edinburgh, and a Licentiate of the College of Physicians in Ireland, and the Author of communications on Irreducible Scrotal Hernia, and recently had temporary charge of the Westmoreland Lock Hospital.

The rates of mortality per 1,000 last week in the principal large towns of the United Kingdom, were—Nottingham 12, Portsmouth 13, Brighton 14, Leicester 15, Oldham 15, Birmingham 16, Sheffield 16, Bristol 16, Norwich 17, Hull 18, London 18, Edinburgh 18, Plymouth 18, Glasgow 19, Bradford 19, Manchester 19, Leeds 20, Salford 21, Liverpool 22, Wolverhampton 24, Sunderland 25, Newcastle-upon-Tyne 25, Dublin 43, more than a fourth of which were deaths which should have been registered in the first five months of the year.

The rates of mortality in the principal foreign cities according to the most recent weekly returns, were—Calcutta 33, Madras 30; Paris 24; Geneva 25; Brussels 26; Amsterdam 21, Rotterdam 29; The Hague 23; Copenhagen 21; Stockholm 26; Christiania 17; St. Petersburgh 37; Berlin 26, Hamburg 27, Dresden 24, Breslau 29, Munich 37, Vienna 29, Buda-Pesth 40, Naples 30, Turin 29, Alexandria 35; New York 24 per 1,000 of the populations. Small-pox caused 36 deaths in St. Petersburgh, and cholera 88 in Calcutta.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Cambuslang. — Fever Hospital Accommodation. — Steps were recently taken by the Cambuslang Local Authority with a view of getting the parishes of Rutherglen, Blantyre, and East Kilbride, to join with them in erecting a combined fever hospital to suit patients from any of these districts, but the negotiations have now fallen through, owing to the refusal of two of the parishes mentioned to take any action in the matter. A circular has now been sent to each of the parishes in connection with the Hamilton Poorhouse, asking (1) What provision the local authority have made in case fever should break out in the district? and (2) If they would be willing to combine in erecting a fever hospital adjacent to the Hamilton Poorhouse for the use of all the parishes in the combination? The districts interested are Cambuslang, Avondale, Blantyre, Glassford, East Kilbride, Dalserf, Hamilton, and Stonehouse, and few of these have any fever hospital accommodation at their command.

Society of Accountants in Edinburgh and the Royal Infirmary.—At a special meeting of this society, held on the 30th June, it was unanimously resolved to furnish one new ward in the Royal Infirmary from the society's funds.

Health of Glasgow.—The death-rate of Glasgow for the past week was 19 per 1,000 per annum, as against 20 in the preceding week, and 27 in the corresponding week of last year.

Greenock Infirmary.—Dr. Samuel McPhail, Edinburgh, has been appointed resident surgeon to the Greenock Infirmary, in room of Dr. Cairns, resigned.

Edinburgh Royal Maternity and Simpson Memorial.—The medical board of this hospital have appointed Mr. George Hurst, M.B. and C.M., and Mr. Thomas A. Machattie, M.B. and C.M., as house-surgeons for the quarter beginning on 1st August, in room of Mr. G. T. Atkinson, M.B. and C.M., and Mr. E. F. Scougal, M.A., L.R.C.S., whose period of service then expires. During the past quarter Dr. Keller has been medical officer on duty, and he will be succeeded on 1st August by Dr. J. Halliday Croom.

Montrose. — Asylum and Infirmary Board.—At the monthly meeting of this board, held on the 1st inst., Mr. Paton, chairman of the house committee of the Asylum, said that he had received the amended plans and schedules of the additions to the asylum from Mr. Anderson, Edinburgh, the architect, and that schedules of the work to be done had been sent to the principal tradesmen in the district, and in Dundee. He suggested that a special meeting should be held on the 15th inst., to open the offers, that the work might be proceeded with immediately thereafter. This was agreed to. On the recommendation of Dr. Steele, who was appointed sole

Digitized by Google

medical officer to the infirmary at the annual meeting in June, Dr. Lawrence was appointed as colleague to Dr. Steele.

GLASGOW ROYAL INFIRMARY.—In the entrance hall of the Royal Infirmary there has just been placed a stained-glass window intended to preserve the remembrance of the Loan Exhibition and its very successful issue. The subject represented is "The Healing of the Sick," and is the work of the firm of Messrs. Adam and Small. The picture is the gift of a well known citizen.

THE FURNISHING OF THE NEW ROYAL INFIRMARY, EDINBURGH.—At a meeting of the drapers' assistants, Mr. Bird presiding, held on the 2nd inst., at 5 St. Andrew Square, a motion was passed which set forth that it was highly desirable that an effort should be made to raise the necessary funds for the furnishing of a ward in the new infirmary among the employées—male and female—in the drapery establishments of Edinburgh. A committee was appointed to carry this resolution into effect.

THE CHAPLAINCY OF THE ABERDEEN ROYAL INFIRNARY AND LUNATIC ASYLUM.—The managers of the Aberdeen Royal Infirmary and Lunatic Asylum are called to meet on Monday, the 7th July, for the purpose of electing a chaplain to these institutions, the office having become vacant by the resignation of the Rev. A. Ferguson. There are eight candidates for the post.

THE LATE SURGEON-GENERAL SMALL.—The death is announced at Woolwich on the 3rd inst., of Deputy Surgeon-General John Small at the comparatively early age of 56. The deceased gentleman began his medical career as apprentice to the late Mr. J. F. Macfarlane, North Bridge, Edinburgh, and pursued his studies at the University and the extra-Academical School. He received the license of the Royal College of Surgeons in 1843, and after two years spent in private practice, entered the army in 1845. Shortly after joining the 12th Regiment, which was then stationed at Mauritius, he was ordered to the Cape to serve in the war with the Kaffirs in 1853-54, for which he received a medal. He was for some time surgeon to the Cape Mounted Rifles, and for several years was staff surgeon at Mauritius. While on that island his reports on the fever epidemics, which caused great havoc among the population, were considered of much value at head-quarters. The deceased officer was promoted to be deputy surgeon-general in 1875, and was entrusted with the charge of the Woolwich district. His death so soon after his return from a lengthened period of service abroad, is much regretted by a wide circle of friends.

LITIGATION AS TO A PROPOSED EYE INFIRMARY FOR GREENOCK.—By the will of the late Mr. James Ferguson, Merchant and Sugar-Refiner, Glasgow, who died in 1865, the sum of £6,000 was bequeathed for the purpose of an eye-infirmary in Greenock; or, by a codicil, for the support of an experienced eye-doctor to attend gratuitously to all who might require his aid, to be appointed by the provost and magistrates of Greenock. An action was raised by Mr. Ferguson's trustees for the purpose of settling—first, whether the bequest was a valid one; and secondly, whether it bore interest from the death of Mr. Ferguson. Lord Curriehill answered both questions in the affirmative. Against this, finding the residuary legatees reclaimed; but on the 4th inst., in the First Division of the Court of Session, the case was arranged on the footing that the legacy was to be paid, also a sum of £1,300 in full of interest. The Court thereupon appointed the magistrates to lodge a draft of a scheme which they propose for the management of the infirmary.

Literature.

OUTLINES OF PHYSIOLOGY IN ITS RELATION TO MAN. (a)

THOUGH this work is of moderate compass, it will be found to give very full, as well as accurate, information on most points on which it treats. It is written, according to the preface, to further the course of lectures delivered by the writer. It is for the student the work is professedly written, and no doubt the book is essentially a student's manual. Professor McKendrick is well known as a teacher, and he boldly says of the student's wants: "What he needs is a statement of authenticated facts and generally received principles as these appear to the mind of his teacher." The book is what it professes to be, "Outlines" of Human Physiology. If the student wish to inquire further he is told to consult "Michael Foster's masterly Text-Book, or Hermann's Physiology, translated by Professor Arthur Gamgee." The author explains that he has avoided the discussion of minute anatomical and histological details, regarding them as rather belonging to the province of anatomy. On the other hand, great pains are taken to demonstrate the working of the different instruments required by the physiologist, and of the methods by which physiologists have acquired many of the facts of science. Indeed, this division of the book is better handled here than in any other work on physiology with which we are acquainted; and the author believes "this mode of treating the subject gives it an interest which otherwise it could not possess. It stimulates thought, and its study is an intellectual training of a high order."

Such then is Prof. McKendrick's *raison d'etre* for his little book. It is profusely illustrated with high-class woodcuts, which add much to its instructive value.

We may now glance at some bits, here and there, of this book to show the author's method of handling his subject matter. Ferments are briefly considered, and are divided into (*a*) soluble and (*b*) organised ferments. "The soluble ferments are those which are the products of secretion, or of chemical changes in animal or vegetable cells; and, as examples, may be taken diastase of malt, and ptyaline found in saliva. They are solid, amorphous, colourless, tasteless bodies, soluble in water, and precipitated from their aqueous solutions by alcohol and the acetates of lead. Chemically, they resemble in constitution the derivatives of albuminates, but they contain no sulphur." Among the fermentive processes are the conversion of starch into sugar by the ptyaline of the saliva, and the ferment of the pancreatic juice; the splitting up of fats into fatty acids and glycerine by the action of a ferment in the pancreatic juice. In speaking of the nutrition of muscle he writes: "A muscle in a state of rest, and supplied with blood, absorbs oxygen and eliminates carbonic acid. During contraction these changes are much increased, and the elimination of carbonic acid goes on more rapidly than the absorption of oxygen. The circulation of the blood is more active in a contracting muscle than one at rest. According to Bernard, at the moment of contraction the blood is retained in the capillaries, and does not enter the veins. It passes only into the veins in the interval of muscular contraction, and the blood flowing in the veins from a contracting muscle is dark and distinctly venous, whilst if the muscle is in a state of repose, it is red and arterial. The exact nature of the chemical processes happening in a muscle during contraction is still within the region of hypothesis, and not of fact. It has been ascertained that during contraction the substances which may be extracted by water from muscle are diminished, while those extracted by alcohol are increased. At the same time, the muscle becomes acid from the development of lactic acid, and the amount of acid formed increases with greater muscular activity." It is supposed that the glycogen contained in muscle is broken up into lactic acid, which unites with soda in the body, and is there oxidised; but Prof. McKendrick does not commit himself to such an exact statement. "The venous blood, coming from a muscle in a state of activity, is warmer than that flowing from a muscle at rest."

(a) "Outlines of Physiology in its Relation to Man." By J. G. McKendrick, M.D., Professor of Physiology in the University of Glasgow. Pp. 751, Maclehose, 1878.

Digitized by Google

Vomiting may be caused by (1) Substances taken into the stomach, as emetics, &c. (2) By the action of poisonous substances introduced into blood-vessels, or absorbed by the skin. (3) By irritation elsewhere, as in pregnancy and renal calculus. (4) By irritation in the neighbourhood of reflex centres, as inflammation in the base of the brain. (5) By psychical conditions, as the remembrance of a loathsome object. Sea-sickness is associated with the nerve arrangements which belong to the sense of equilibrium.

A great many subjects present themselves for quotation in order to demonstrate Prof. McKendrick's clear, concise, yet lucid expositions of difficult matters, but space prevents our doing so. We must content ourselves with saying that this is an excellent bit of work, well done, achieving all the author aims at, and more than he professed to aim at. It is a useful addition to our teaching manuals, and though written for students, it contains much useful information for practitioners who do not aspire to make themselves familiar with the more elaborate works to which Prof. McKendrick refers in his preface.

A MANUAL OF PRACTICAL CHEMISTRY. (a)

This work is more valuable to the "public" or "food" analyst than to the toxicologist. At the outset we cannot help regretting that Mr. Blyth did not wholly devote his book to the chemistry of adulteration. The toxicological part of the work is, no doubt, excellent so far as it goes; but no one engaged in the practice of medical jurisprudence would content himself with the limited information given by Mr. Blyth. There are excellent and recent works on toxicology by Taylor, Guy, Tidy, Wormley, and others; and as Mr. Blyth's work is not nearly so complete as any of these, it is not likely to supersede them. As a rule, when an analyst deposes in court that he has detected, say arsenic in the viscera of a man, he is generally asked to describe the symptoms produced by the administration of the poison, and the lesions which it produces; very little information on these points is given, but the medicinal and poisonous doses of the various toxic substances are stated.

The detection of the more commonly occurring poisons is treated briefly, but with great accuracy. A few new processes are described, amongst which are Dr. Davy's new method of testing for arsenic by acting upon sodium amalgam with the solution of the suspected liquid, and seeing whether or not the gas which is evolved blackens paper steeped in solution of nitrate of silver. This is a good way of avoiding the use of acid and zinc, both of which are difficult to obtain free from arsenic. Arseniretted hydrogen blackens paper embued with nitrate of silver.

Very good and clear directions are given for the detection of adulteration of articles of food. Coming so soon after the publication of the second edition of Dr. Hassall's classical work on the Adulterations of Food and their Detection, we could not expect much in the way of novelty in Mr. Blyth's book. There are, however, a few new processes described, and the papers which have recently been published in the *Analyst* (the organ of the Society of Public Analysts) have furnished the author with good materials for his articles on milk, butter, and flour. A weak point in the book as compared with Hassall's is the paucity of illustrations. There are only nineteen of all kinds, and of these six refer to toxicology and seven to tea. The chemical tests in the case of arrowroot adulteration are not very reliable, but the microscope and the polariscope give unerring proofs of the sophistication of that article by potato starch and other cheap materials. Our author certainly should have given us woodcuts showing the appearance of the different kinds of starch. In the same way he has not given us the microscopic appearance presented by chicory, which is the common (and by the microscope easily detected) adulterant of coffee. Altogether we may say that the want of illustrations prevents this work from being used as a substitute for Hassall's book; but still it will be found a valuable addition to the volumes used by the food analyst and toxicologist, as it contains some matters of importance which are not to be found in the latter.

(a) "A Manual of Practical Chemistry: the Analysis of Foods and the Detection of Poisons." By Alexander Wynter Blyth, M.R.C.S., F.C.S. London: Charles Griffin and Co. 8vo, pp. 468. 1878.

The article on milk is fully treated. The author considers it proved that aphthous fever is propagated through the medium of the milk of cows suffering from foot-and-mouth disease. With respect to the communicability of phthisis through the medium of the milk of cows affected with tuberculosis, he states:—1. A disease similar if not identical with tuberculosis may be propagated from animal to animal by the means of milk derived from a diseased cow. 2. That, therefore such milk is unfit for food. 3. That nothing definite is unknown with regard to the propagation of tubercle from the lower animals to man.

Mr. Blyth quotes the experience of M. Vallin, who for four months sought in vain for a phthisical cow, and according to whom there are only from twenty to twenty-eight out of the 28,000 beasts annually slaughtered in Paris in which tubercles are detected. M. Vallin would, we are certain, find it by no means difficult to discover a phthisical cow in the dairy yards of London or Dublin.

Mr. Blyth regards as pretty certain the occasional propagation of typhoid fever by means of milk, but very properly regards the liquid as a mere vehicle for the *materies morbi*, such as an infected garment is. That is, the milk is contaminated, not from the cow, as in the case of aphthous disease, but with epithelial scales, particles of ejecta, &c., from affected persons.

In conclusion, we can truthfully say that any one engaged in analytical and medical chemistry cannot fail in acquiring solid information from this little work.

Literary Notes and Gossip.

Among the most important and suggestive features of the present day, the increased and continually-increasing demand for books and journals may undoubtedly be reckoned. It is not asserting too much to say that, where readers were formerly counted by tens, they are now numbered by thousands. The observation made to a few select friends by Cicero, nearly two thousand years ago, concerning books and their value, is now generally recognised as true, and books are now universally accepted as being, to use the words of the great Roman orator, "the food of youth; the delight of old age; the ornament of prosperity; the comfort and refuge of adversity; a delight at home, and no hindrance abroad; companions by night, in travelling, in the country."

* * *

The *Athenæum* informs us that the members of the London Library have just given a substantial proof of their confidence in the stability and abiding prosperity of the institution. A sum of £20,000 being asked for, on debentures at 4½ per cent., to complete the purchase of the premises in St. James's Square, tenders were sent in by members of the library for £40,200.

* * *

We regret to hear that the Council of the Royal Geographical Society have very unwillingly resolved to discontinue the annual course of scientific lectures which they instituted some three years ago with the view of promoting the cause of geographical research. This apparently retrograde action has been caused, says the *Academy*, by the great want of interest taken in the lectures and by the impossibility of confining the lecturers within what may be termed purely geographical limits.

* * *

A well-known anthropologist, Dr. A. Weisbach, of Constantinople, has written an essay in which he alleges that the rapidity of the pulse-beat varies in different nations, within very wide limits. Thus, the pulse of the Congo negro beats 62 times in a minute, while the quickest pulses are found among the Tagals (80), and the Madurese and Nikobars (84). The Japanese pulse beats 78 times per minute, and the Chinese 79.

The Royal Belgian Academy of Medicine offers a prize of 5,000 francs (about £200) for the best essay on "The Elucidation of the History of the Diseases of the Nervous System, and principally of Epilepsy." The essay is to be written in French or Latin, and forwarded to the Secretary of the Academy, Brussels, before the 1st October.

* * *

Mr. M. T. Bass, M.P., for Derby, visited Derby on Saturday last, and handed over to the Mayor, for the use of the

Digitized by Google

inhabitants, the title deeds of the free library, which he has built and furnished at a cost of over £15,000. The day was observed as a half holiday, and there was an enthusiastic public demonstration in honour of Mr. Bass.

* * *

Those of our readers whose bookshelves are, in damp seasons or places, visited with mildew, may be glad to know that books bound in Russian leather are seldom or ever affected by damp, and that the perfume of the real article is sufficient to keep away moths and other destructive insects. Other leathers or cloth bindings may always be preserved by brushing them over with spirits of wine.

* * *

The half-yearly volume of that useful library companion, "Braithwaite's Retrospect of Medicine," has just appeared, and contains the usual quantity of carefully selected articles upon every subject a practitioner is likely to be interested in. Every medical journal of importance is brought into requisition, and it may be assumed with tolerable certainty, that the most practical and instructive contributions of the six months find a place in this work.

* * *

The *Sanitary Record*, like its congener, the *Medical Record*, has now ceased to exist as a weekly publication, and will be carried on similarly in future as a monthly. The step is undoubtedly a wise one, as those who take sufficient interest in sanitary matters to subscribe for a journal devoted to nothing else. are so few, that others beside the conductors of the *Sanitary Record* have found that to cater for them alone does not pay. The Journal called *Public Health* has changed hands a number of times with the reverse of satisfactory results. Nor can it be wondered at when the medical journals chronicle everything of importance in matters sanitary, and leave so little for purely sanitary journals to do.

* * *

Any one visiting the late Berlin Exhibition would have been astounded with "what could be done with paper." There was a moderate-sized house whose interior, the roof, ceiling, cornices, and walls were entirely composed of this article; the exterior walls only were of pine wood; all the furniture, blinds, curtains, chandeliers, carpeting, ornamental doors, mantel and table ornaments, were of paper, including a stove made of asbestos paper, in which a fire was burning cheerfully. There were also exhibited wash basins, water cans, a full-rigged ship, lanterns, hats, shirts, full suits of clothes and underclothing, straps, handkerchiefs, napkins, bath tubs, buckets, bronzes, flowers, urns, jewellery, belting, &c., both for use and ornament.

* * *

The Victoria Institute, or Philosophical Society of Great Britain, which during the last eight years has quadrupled its number of members (they now reach nearly 800, including 33 prelates), was founded as a Society to associate English and Foreign men of science and authors for the purpose of investigating fully and impartially the most important questions of philosophy and science—more especially those that bear upon Holy Scripture, with the view of reconciling any apparent discrepancies between Christianity and science, and bringing together the results of such labours, after full discussion, in the printed Transactions of an institution. This Society is now making headway in our Colonies and America, and the work achieved, both literary and philosophical, has been of the most encouraging nature. Twelve volumes of Transactions have already appeared, and these will probably be translated into other languages.

* * *

The June number of the *Quarterly Journal of Inebriety* to-hand, contains some very interesting materials upon which practitioners and reformers of inebriety may work with the prospect of good success. The three first papers may be taken as specimens of the whole. No. I. is by Dr. Crothers, on the "Treatment of Inebriate Criminals," in which the author considers them the most difficult class of asylum patients to manage, and for whom there is little hope except under strict military discipline, with plenty of manual labour. No. II. is by Dr. Mattison, on a "New Method of Treatment in Opium Inebriety," in which bromide of potassium, ammonium, sodium, and lithium play a prominent part. No. III. is by Dr. Chenery, of Boston, on the "Relation of Alcoholism to other forms of Disease," in which the writer endorses Dr. Grose's view that: "alcoholism is the most terrible disease under the sun."

* * *

We are indebted to the *Globe* for the following interesting note:—Dr. Bernhard Wolff, the editor of the *National Zeitung*, who died a few days ago, was the founder of the very first "Telegraph Bureau" for procuring the "latest news" for the Press and the Exchange, and originated the system of a "Central Press" telegraphy. He conceived and executed this idea in the year 1849, and thus initiated that revolution in the conduct of newspapers whose current was later ventured upon by Havas and Reuter. Dr. Wolff was originally a physician, and made his first incursion into the province of letters as a translator of foreign medical books and articles. His great gifts of organisation, however, marked him out as a fit occupant for the editorial chair of the Berlin *National Zeitung*, which he conducted from its foundation in 1848 to his death in 1879. The success of his journal made him a man of immense wealth, and his splendid villa at Paukow was a meeting-place for a large circle of men and women eminent in the worlds of literature and art.

* * *

The International Literary Congress has met in London, and dispersed to meet again next year at Lisbon, without having clearly established any important principle or given effect to any very practical resolutions as a result of their deliberations. The "big village" seems to have awe-struck some of the foreign delegates, and as one of their number aptly remarked, "he was in the centre of everywhere, and yet found himself nowhere." It might have been thought that an assemblage of this kind would have taken cognisance of the report of the Royal Commission, which is full of suggestions affecting the interests of both English and foreign writers, but the majority of the members of the Congress appear to have forgotten that such a report existed. The chief resolutions proposed related to translation, reproduction, and adaptation. The pleasure part of the Congress was the reception by the Lord Mayor, and the presentation to the Lady-Mayoress of a magnificent bouquet as a token of grateful recognition of Mayoral hospitality.

* * *

Amongst the non-professional publications which have reached us during the month, is a new venture by the editor of the *Floral World*, entitled "Greenhouse Favourites," published by Messrs. Groombridge and Sons. For those who possess the luxury of a greenhouse, we can imagine nothing more acceptable than the issue of each monthly part of this work, the design of which is to place in the hands of lovers of floriculture a practical treatise on the cultivation and management of greenhouse plants, at the moderate cost of one shilling per part. The illustrations we have seen are in the highest style of colour-printing, and the text is of that non-technical and practical nature, which will commend it to all who are in search of such a book. Of the other serials, Messrs. Cassell's publications still maintain their popular and instructive character; whilst the *Leisure Hour* and the other two monthlies of the Religious Tract Society fulfil the excellent designs of their promoters in every respect.

* * *

New Books and New Editions.—The following have been received for review since the publication of our last list, June 4th.—"Parasites, a Treatise on the Entozoa of Man and Animals," by T. S. Cobbold, M.D., F.R.S. Klein's "Atlas of Histology," part V. "Pulmonary Hæmorrhage," by R. E. Thompson, M.D. Cantab. "Childrens' Lives, and how to Protect Them," by W. Lomas, M.D. "First Lines of Therapeutics," by A. Harvey, M.D. "The Heart and its Diseases," by J. M. Fothergill, M.D. "A Manual and Atlas of Medical Ophthalmoscopy," by W. R. Gowers, M.D. "The Students' Guide to the Diseases of Women," by A. L. Galabin, M.D. "Lectures on Clinical Surgery," by J. Hutchinson, F.R.C.S., vol. i. part II. "De la Circoncision," par D. Fredrico Rubio. "Cottages, how to Arrange and Build Them," by a Sanitary Reformer. "Lectures on Practical Surgery," by H. H. Toland, M.D., second edition. "The Evolution of Man," by Ernest Haeckel, vols. i. and ii. "Braithwaite's Retrospect of Medicine," vol. lxxix.

* * *

Pamphlets.—We have received the following since the publication of our last list, June 4th:—"Urethrismus, or Chronic Spasmodic Stricture," by F. N. Otis, M.D. "Pendulum Leverage of the Obstetric Forceps," by A. H. Smith, M.D. "Observations on the Contagion of Enteric Fever," by Alex. Collie, M.D. "The Relation of Neurasthenia to Diseases of the Womb," by W. Goodell, M.D. "On the Necessity of Latrine Accommodation for Women in the

Digitized by Google

Metropolis," by J. Stevenson, M.D. "Vivisections; their Unjustifiability," by W. G. Grimson, M.D. "Narrative of the Declaration of War by Chili against Bolivia and Peru." "Other Symptoms of Nervous Exhaustion," by G. M. Beard, M.D. "On Spasmodic Stricture of the Urethra," by H. B. Sands, M.D. "Geheilte Hundswuth beim Menschen," von Dr. Ad. Offenberg. "Provident Dispensaries" (Charity Organisation Society). "Nitrite of Amyl in Angina Pectoris" (Correspondence between Dr. Brunton and Mr. Jesse). "Report of the West Riding Lunatic Asylum for 1878." "Annual Report of the London Temperance Hospital."

Correspondence.

HOT WATER UTERINE INJECTIONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I am glad to find that a physician of Dr. Lyster's position has tried the method of treating *post-partum* hæmorrhage by the intra-uterine injection of hot water, and has published the result. I trust that it will lead others to do so also, and am satisfied that if used in suitable cases, and at the right temperature, it will prove most satisfactory.

Dr. Lyster's case was one in which the treatment was specially indicated, namely, one in which cold water had failed, and the patient had become exhausted and depressed. In such the hot water acts as a powerful stimulus, and seldom fails to be of great use. The water should, however, be used at a much higher temperature, certainly not under 110°. Had Dr. Lyster employed it at that temperature instead of 96°, the effect would have been much more marked.

Yours, &c.,

LOMBE ATTHILL, M.D.

Rotunda Hospital, 2nd July.

THE BOARD OF TRINITY COLLEGE, DUBLIN, ON MEDICAL REFORM.

THE Board, which governs the University of Dublin, has given expression to its opinions upon two subjects of much interest. It has decided definitely and emphatically "That the Board of Trinity College are in favour of direct representation of the Profession upon the Medical Council."

This is an important pronouncement. The more so, because it is the deliberate manifesto of a body which is essentially Conservative, and indisposed for any revolutionary or doubtful movement. The cause of direct representation may be considered to have obvious claims upon common sense when it is adopted as part of the programme of so unbending a body as the Board of Trinity College. That tribunal has also decided—"That the Board are of opinion that the prosecution of persons assuming medical titles without right should be entrusted to a Public Officer," a pronouncement which looks somewhat Utopian.

THE PROFESSORSHIP OF ANATOMY IN THE UNIVERSITY OF DUBLIN.

WE understand that Dr. B. G. McDowel, the Professor of Anatomy in the School of Physic, will not seek re-election at the expiration of the seven-years term, which will take place in October next. The Professorships of the University are held for periods of seven years, and Dr. McDowel, having held office for three such terms, now retires. Rumour says that Dr. MacAlister, Professor of Comparative Anatomy and Zoology in the University, may probably be appointed. The professorship involves a position on the Medical Staff of Sir Patrick Dun's Hospital. The Chair is worth about £800 a year, and being one of the prizes of the profession in Ireland, will, of course, be a subject of acute competition.

The Professorship of Surgery, now held by Mr. Bennett, will be vacant next year, but, no doubt, Mr. Bennett will be re-elected.

ELECTIONS ON THE COUNCIL OF THE ROYAL COLLEGE OF SURGEONS, ENGLAND.

ON Thursday last the Fellows mustered in fairly representative force, those from the provinces being more numerous proportionately, for the purpose of electing four Fellows on the Council of the College. As stated in our issue of June 25th, the vacancies were occasioned by the death of Mr. Hilton, and by the retirement of Mr. Spencer Wells (who sought re-election), Mr. Le Gros Clark, and Mr. Critchett; the six candidates being Messrs. Barwell, Bryant, Hutchinson, Power, Wells, and Wood. The result of the ballot was as follows:—Mr. Spencer Wells 139, Mr. John Wood 129, Mr. Hutchinson 129, Mr. Power 126, Mr. Thos. Bryant 97, Mr. Barwell 22. The President declared the first four of the above to be elected. Mr. Power had 19 plumpers, Mr. Hutchinson 15, Mr. Wood 11, Mr. Bryant 9, Mr. Barwell 3, and Mr. Wells 2.

THE MEDICAL BILLS SELECT COMMITTEE.

ON Tuesday, July 1st, the Committee resumed the examination of Mr. Simon. He was first examined by Mr. Errington as to a petition from the Queen's College, Cork, which asserted that uniformity of examination would involve uniformity of teaching—an opinion which Mr. Simon considered "ridiculous." On being asked whether he was aware that in Ireland diplomas were granted after two years' instead of four years' study, he said he knew that representations had been made to the Medical Council that examinations meant to be preliminary are in fact not preliminary. He believed that in the University of Dublin, the Queen's University, the King and Queen's College of Physicians, the Royal College of Surgeons, and the Apothecaries' Company, the period of study required is four years.

REGISTRATION OF STUDENTS IN DUBLIN.

Mr. Errington.—You have also been asked, with reference to the registration of students in certain medical schools in Dublin, would it not be the business of the Branch Council to look after that registration, and, if it has been neglected, is not that a reflection upon the manner in which the Branch Council carried out its duties?

Mr. Simon.—It appears that the Branch Council regarded the question as one between the impugned bodies and the General Medical Council, and they therefore declined to make any observations on the subject. It is not within my official knowledge that certificates of attendance at lectures are given in many schools which do not actually imply that there has been any attendance. If it were I should refuse to acknowledge such certificates. Attendance at lectures, where required, ought to be actually given.

AUTHORITY OVER LICENSING BODIES.

As to the exercise of an increased authority over licensing bodies by the Medical Council, Mr. Simon thought that a power by the Medical Council of suspending a body for misbehaviour would be fruitless. An extremely strong case would be requisite to justify the Council in suspending a body, and the difficulty of establishing such a case would be almost insuperable. A moderate laxity of examination might have a very awkward effect on the public, but it would be very difficult for the suspending authority to establish it as against a body that wished to discuss the fact.

DIRECT REPRESENTATION.

On being asked about the agitation for direct representation, he did not deny that the supporters of direct representation

Digitized by Google

have maintained that it would improve the constitution of the Council for educational purposes. He believed that the enthusiasm that culminated in the memorial was very much the result of the propaganda of the British Medical Association. He guarded himself against expressing an opinion that these petitions were as valuable as if every signature attached to them represented an independent judgment. I think the introduction of direct representation would be calculated to deteriorate the Council. He believed that nearly all the medical journals were in favour of direct representation. He expressed his opinion "that every member of a medical corporation ought to be able to vote for the governing body. In the College of Surgeons there are 10,000 members, any of whom can become fellows if they choose to take a higher grade. The fellows elect the Council of the College, and the Council elects the representative in the General Medical Council. The present representative is Sir James Paget. If his name could be put up to a plebiscite, 'yes' or 'no,' I have no doubt the "yes" would have a satisfactory majority; but if the 10,000 members were called upon to vote for certain names, I doubt whether there would be so good a choice. There is a difference between the election of a member of the Medical Council and the election of a member of Parliament. Members of Parliament go and show themselves, and make speeches to their constituencies. A candidate for the Medical Council would not come face to face with his constituents, who would know no more of him than the particular organisation promoting his return thought proper to tell them. I am aware the members for the universities do not solicit votes or appear on the hustings, but they are amongst the best known men in the universities they represent."

CONJOINT SCHEME IN SCOTLAND.

Mr. Simon was then questioned by Dr. Playfair as to the effect of the conjoint system on the Scotch Universities.

Dr. Playfair asked—If a poor student has to pay £30 for a minimum qualification, will not that be an inducement to be content with the minimum examination, and not to pay twenty guineas more to obtain a higher qualification?

Mr. Simon thought it unlikely "that a man, whether rich or poor, would pay twenty guineas for a worthless professional qualification. If there were no difference between the degree of Bachelor of Medicine of the Scotch University and the certificate of the Conjoint Board of Examination he did not see why a man should pay twenty guineas for the Scotch degree. If there is a difference he would go up for it. I am aware that there is a proposal, supported by high authority, that university students should only be required to pass the final examination on a payment of five guineas, but that only had reference to a voluntary system. He should be prepared to recommend the acceptance of a similar principle in Scotland in the matter of earlier examinations.

IRISH COLLEGE OF SURGEONS.

Mr. Plunkett finally asked the witness some questions respecting the Irish College of Surgeons, to which he replied that he could express no opinion as to whether the imputations that had been made were well founded. He could not say whether there was laxity in the matter of preliminary examinations. If there has been it is to be regretted, but he had no doubt that the College had acted in good faith, and, speaking generally, he had no doubt of the excellence of its qualifications. He thought it very desirable that the separate authorities should be represented on the Medical Council. He thought the continued maintenance of the libraries and museums of the corporate bodies would be for the public good as well as for the good of the bodies themselves. The museum and library of the London College of Surgeons, on which nearly £3,000 is spent, benefit no individual member of the corporation. He had no reason for thinking that other corporations which apply their funds in a similar way do so for any selfish purposes.

Dr. Quain was then examined. He considered that the Medical Council was well adapted to carry out its object. With regard to education it would be impossible to do more than it had done. All the bodies in England had agreed to the Conjoint Examination Scheme, but the College of Surgeons had declined to carry it out until a similar scheme had been brought into operation in Scotland and Ireland, fearing that the London students would resort to those countries to escape the severity of the conjoint examination. Dr. Quain gave full details of the income and expenditure of the Medical Council. He considered that the Council would be, as at present constituted, incompetent to perform other duties, as, for instance, duties with regard to sanitary measures or poor-law boards. The Council is not adapted to perform the new duties proposed to be imposed upon it—namely, to give counsel to the State with regard to medical questions to prevent illegal practices with more stringency than at present, or to represent the present interests of the profession. The direct representation of the profession on the Council would be undesirable.

In answer to Mr. Mills, the witness said that direct representation would periodically cause most unpleasant contentions, strugglings, and jealousies in the medical profession, and there would be no object gained by it.

THE RELATIVE COST OF DIPLOMAS.

Replying to Mr. Wheelhouse, he observed that it is less expensive for a man to obtain a diploma from the University of Edinburgh than from some other bodies, and that would account for the large number of applicants for Scotch diplomas. A large number of gentlemen applying for and obtaining Scotch diplomas go from England to get those diplomas, and then come back and practise here. The least expensive diploma is that given by the Apothecaries' Hall of Ireland, which costs 10s. 6d.

Medical News.

University of Dublin.—The following degrees were conferred on June 25th:—

DOCTOR IN MEDICINE.—Edward Joseph Latham Blacker, William Featherstone H. Lambert, Joseph Lister (*honoris causâ*), Gilbert Richardson, Samuel Warren, Charles Rolleston Woods, Thos. Blair Worthington.

BACHELOR IN MEDICINE.—John Battersby, Fitzgerald Blood, Abraham Cohen, John Singleton Darling Darling, Hy. Grey Edwards, Arthur Richard Frederick Exham, John Charles Hogan, William Stewart Lecky, John Auchinleck MacMunn, Andrew Murray, Joseph Dallas Pratt, Gilbert Richardson, Crosdaile Miller Thompson, Frederick William Warren, John Williams.

BATCHELOR IN SURGERY.—John Battersby, Frederick Chas. Berry, Fitzgerald Blood, Henry Grey Edwards, Arthur Richard Frederick Exham, John Charles Hogan, William Stewart Lecky, Benjamin Thomas M'Creery, John Auchinleck MacMunn, Abraham Malley, Thomas Tilly Moore, Andrew Murray, Thos. Orde Smith, Crosdaile Miller Thompson.

Medical Defence Association.—At the annual meeting of the members of this Association the following officers were elected for the ensuing twelve months, viz.:—President, Dr. B. W. Richardson, F.R.S.; Hon. Treasurer, Mr. W. Spencer Watson; Hon. Secretary, Mr. George Brown. Members of Council: Mr. H. Adcock, Mr. F. Alderson, Mr. John Borland, Dr. H. Cuolahan, Mr. Thomas Cooke, Mr. H. Dyte, Dr. J. Dixon, Mr. R. T. Daniell, Mr. W. B. Hemming, Mr. Douglas Hemming, Dr. B. Kelly, Dr. W. Beech Johnston, Mr. C. P. Langford, Mr. Wood Hill, Mr. J. Wallis Mason, Dr. Charles Royston, Mr. Walter Smith, Dr. James Stevenson, Dr. G. Danford Thomas, and Dr. H. W. Williams.

The Cancer Hospital, Brompton.—The annual general meeting of the governors of this Hospital was held at Brompton on Thursday last, Geo. T. Hertslet, Esq. (treasurer), in the chair. It appeared by the twenty-eighth annual report that the financial position of the charity was satisfactory, although there had been a falling off in the items of donations and subscriptions. During the year exactly 1,000 new patients had been received, 323 being in, and 677 out-patients. The report recommended that, being in possession of the necessary funds, the committee should appropriate them in adding a new wing to the present building, it being absolutely necessary that the accommodation should be in excess of the immediate requirements, so as to admit of the closing of certain wards from time to time for the purpose of thoroughly disinfecting them.

Dr. Tuckey.—Corrected proof not received until we were at press. The communication will appear in our next.

THE TITLE OF PHYSICIAN.

To the Editor of the Medical Press and Circular.

Sir,—Through the medium of your journal I beg most respectfully to ask the President of the King and Queen's College of Physicians of Ireland to say whether a licentiate of that College is *entitled* to call himself physician, or is it as you have stated, that *he has no more right to call himself, or to be called, a physician than the boy who carries out his medicines?*

Your obedient servant,

June 28, 1879. L.K. & Q.C.P.I.

[In answer to other correspondents we stated in our issue of June 25, page 514, that, "in its etymological signification, 'physician' means a person who 'professes physic,' or who 'prescribes medicinal remedies for diseases.' In that respect, therefore, any licensed medical practitioner is a physician, as even the pure surgeon can scarcely avoid prescribing constitutional remedies for his patients; and with still stronger reason may licentiates of a college of physicians be said to be physicians in so far as they have received a *license* to prescribe medicines for strictly medical diseases." We hoped this would satisfy our correspondents, and show them that in defining the *rôle* of the physician in the popularly accepted sense, we in no way intended to cast a slight upon the position of licentiates of a college of physicians. The "figure of speech" used by the writer of the article, and referred to by our correspondent, was, perhaps, not a happy one, and we regret it.—Ed.]

Dr. J. O. F.—"Very like a whale."

M. Betagh.—The children were better on April 16th. Hydrophobic symptoms were first noticed on May 10th in both cases; both children died on the same day, May 14th.

PROFESSIONAL HONOUR.

To the Editor of the Medical Press and Circular.

Sir,—From the manner in which a certain election has been described by the correspondent who signs himself "Professional Honour," I have reason to believe that I am the party accused; therefore, I feel it incumbent on me to refute the untrue particulars he has stated and to assert that he has misrepresented the case. As to I and he being a tie on two occasions, and the third time resulting in my favour by a majority of one, is true, as also is the fact that I asked, in presence of the chairman and others, what his terms for a week's duty were. This last proceeding might appear ungentlemanly, unprofessional, and uncalled-for, and doubtless would be so were it not that I had good cause to doubt this gentleman's word from the fact of his having only a fortnight before promised faithfully not to oppose and even to secure his own voters to my advantage, only to betray me. I mentioned the affair in presence of others in order that I might have witnesses in case he endeavoured to impose on me. That I refused to pay him is nothing less than an untruth, as I offered him payment in presence of two other gentlemen, though he refused, being a little excited by a dispute we had, and he left, saying he'd make it £3 3s. now. That is the case truly. He could have got paid at any time since, and I was only too anxious to have done with him, but he never mentioned it since, and neither did I, thinking that some time or other he may send for it. As he once refused he might ask it once also. There was no necessity to resort to law as I should feel very glad to be clear of the gentleman He has made a statement, too, in regard to the injury done him by slanderous bills being posted about his father which he attributes to me or my friends. That I deny most emphatically, and denounce as strongly. I never sought to derrogate from his character, nor his father's in any way, as I was absent at the time of the bill-posting, and I would not recognise any one guilty of such low conduct as a friend. It might be more the actions of his father's enemies than my friends, and I think he had better apologise for imputing such disgraceful conduct to me.

Trusting you will be good enough to publish this if I am the accused, and apologising for having to trespas so much on your valuable space,

I am, yours truly,

Honesty.

The Discussion on Diphtheria—Dr. Kelly desires to make the following corrections in his last letter: For *mainly* read *vainly*, and for *vertex* read *vortex*. These errors, although very slight, Dr. Kelly thinks might possibly mislead as to the idea he wished to convey.

VACANCIES.

Ballycastle Union, Croagh Dispensary.—Medical Officer. Salary, £100, with fees, and £20 as Sanitary Officer. Election, July 11.

Birmingham, Children's Hospital.—Non-Resident Surgeon. Daily attendance required. Salary, £60, with partial board. Applications to the Medical Board.

Brecon Infirmary.—Resident House Surgeon. Salary commencing at £120. Applications to the Secretary on or before July 10.

Brighton and Hove Dispensary.—Resident House Surgeon. Salary, £140. Applications before Aug. 4th to the Chairman.

Coton Hill Asylum.—Assistant Medical Officer. Salary, £100, with board, &c. Applications to Dr. Henson, Coton Hill, Stafford.

Dundalk Union, Carlingford Dispensary.—Medical Officer. Salary, £100, with fees, and £25 as Sanitary Officer. Election, July 10.

Dunfanagha Union, Falcaragh Dispensary.—Medical Officer. Salary, £100, with fees, and £10 as Sanitary Officer. Election, July 16.

Gateshead Dispensary.—Assistant Surgeon. Salary, £120, without residence or board. Applications to the Hon. Sec. before July 17.

Isle of Thanet Union.—District Medical Officer. Salary, £95, with the usual extra fees. Applications to the Clerk at Minster, Ramsgate, before July 17.

Oldcastle Union, Crossakiel Dispensary.—Medical Officer. Salary, £120, with fees, and £15 as Sanitary Officer. Election, July 11.

Shillelagh Union, Coolattin and Clonegal Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, July 11.

Shillelagh Union Workhouse.—Medical Officer. Salary, £90, and £10 as Consulting Sanitary Officer. Election, July 11.

Wilts County Lunatic Asylum.—Assistant Medical Officer. Salary, £110, with board. Applications to Dr. Cooke, at the Asylum, Devizes.

APPOINTMENTS.

Casey, J. S., has been elected Coroner for the Eastern Division of the County Limerick.

Coates, W. H, M.R.C.S.E., Medical Officer for the No. 1 District of the Tonbridge Union.

Coumbs, S. W., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for the Claines District of the Droitwich Union.

Corbett, M., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer, Medical Officer of Health, &c., for the Buttevant Dispensary District of the Mallow Union, co. Cork.

Donovan, W., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer of Health for the Whitwick Urban Sanitary District, Leicestershire.

Ewbank, F., M.R.C.S.E., an Assistant Dental Surgeon to St. Bartholomew's Hospital.

Harrison, A., M.R.C.S.E., L.R.C.P.Ed., House Surgeon to the Stockport Infirmary.

Hepburn, Mr. W. J., Surgeon to the Meath Hospital, Dublin.

Holmes, J., L.R.C.P.Ed., L.R.C.S.Ed., Resident Medical Officer to the Barrington Hospital and City of Limerick Infirmary.

Lyons, I. I., M.R.C.S.E. & L.D.S., an Assistant Dental Surgeon to St. Bartholomew's Hospital.

Magner, E., M.D., C.M., Medical Officer, Medical Officer of Health, &c., for the Courcey's Dispensary District of the Kinsale Union.

O'Kelly, T. E., L.R.C.P.Ed., L.R.C.S.I., Resident Medical Officer to Maynooth College.

O'Rorke, C. T. J., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Ballinrobe.

Roche, J., M.D., M.Ch. (late Bombay Medical Staff), Medical Officer to the Troops at the Pigeon House Fort, Dublin.

Ross, D. McKieszick, M.B, Honorary Physician-in-Ordinary to the Brighton and Hove Dispensary.

Williams, W. H., L.R.C.P.L., M.R.C.S.E., Public Vaccinator for the Southern District of the Sherbourne Union.

Births.

Digges.—On June 28, at 59 Strand Road, Sandymount, the wife of Wm. H. Digges, L.R.C.P.Ed., &c., of a son.

Mactier.—On June 29, at St. Andrew's, Fife, the wife of W. F. Mactier, M.D., Bengal Service, of a daughter.

Swanzy.—On July 1, at 23 Merrion Square, Dublin, the wife of H. R. Swanzy, F.R.C.S.I., of a son.

Westropp.—On June 17, at Cloghan House, Derrylin, co. Fermanagh, the wife of C. G. Westropp, L.R.C.S.I., of a daughter.

Deaths.

Abercromby.—On June 17, at Putney, John J. M. Abercromby, L.R.C.S.Ed.

Everett.—On July 1, at Portsdown Road, Southampton, Anna Maria, wife of George Everett, M.D., aged 57.

Hamilton.—On June 27, at 50 Upper Rathmines, Elizabeth, relict of the late John A. Hamilton, M.D., F.R.C.S.I., of Omagh, co. Tyrone, aged 64.

Maunder.—On July 4, Charles F. Maunder, F.R.C.S., Surgeon to the London Hospital, aged 47.

Nicholson.—On June 21, at Worcester, John Nicholson, M.R.C.S.E., aged 40.

Roche.—On June 24, at Hatch Street, Dublin, George Roche, M.D., aged 76.

Woods.—On May 28, at Herman, near Stanger, Port Natal, South Africa, Arthur Appleton Woods, M.D., aged 29.

IRISH POOR-LAW INTELLIGENCE.

MONASTEREVAN UNION.

SANITARY INSPECTION.

THE Clerk read the following letter :—

"GENTLEMEN,—At your last meeting some strictures were passed on my efficiency as sanitary officer. As such I have properly inspected and reported on every case of nuisance brought under my notice by the sanitary sub-officer or others. The appointment of the late officer to the district clearly points out that my duties are to inspect and report on every case of nuisance brought under my notice by him. Since the dismissal of sub-sanitary officer Burke only one case has been reported to me. A few others sent in came under my notice in the performance of my other duties through the district. . . . . The appointment of a sanitary sub-officer, who will see to the execution of my reports will insure the success of the Public Health Act here. I would beg to remind the board that whenever there has been a question of the proper discharge of the duties incumbent on the sanitary officer or other officers, the rule hitherto applied has been first of all to ask them for an explanation.—Your obedient servant,

"M. DARBY,
"Sanitary Officer, Monasterevan."

Mr. Murphy—There has been no alteration by the passing of the new Act. The 280th section of the Public Health Act, 1878, provides that all bodies, committees, or officers, under the Sanitary Act at the time of the passing of the new Act shall not be affected by the passing of the Act, but shall hold office as if the Act had not passed.

The Clerk was directed to call the doctor's attention to the section.

LIMERICK UNION.

DR. BARRY having complained that he was performing a larger share of hospital duty than the guardians laid down in Rule 13, owing to a difference of opinion having arisen between him and the resident medical officers as to the definition of what were to be considered chronic cases, the committee ask the Board of Guardians to rule that all cases of first admission to hospital are to be classified as acute until the medical officers in charge have had time to satisfy themselves that a patient is suffering from a chronic phase of disease, when the necessary alteration in the classification will be made ; consequently, as the guardians in Rule 14 have decided that all chronic cases should be placed under the charge of the resident medical officers, whenever Dr. Barry considers the case of any of his patients to be of a chronic nature, he would intimate the fact to the resident medical officers, who will as soon as convenient, meet Dr. Barry in consultation, and, should they agree that the case was one that could be fairly classified as chronic, they will relieve Dr. Barry from the duty of further attendance on ; but in order that a ready record may be available to the name of the medical officer who had charge of the case id its acute stage, Dr. Barry's card will still remain over the patient's bed, but over it another card will be inserted chronic, and the name of the resident medical officer in charge of it.

LIMERICK DISPENSARY.

LETTER read from the L. G. B. relative to the issuing of tickets to persons who appear to be able to attend at the Dispensary. The letter also directs the attention of the committee to a circular of the L. G. B. of August 31, '78, in which they brought under the notice of the Committee of Management, certain irregularities in the issuing of tickets, and expressed a hope that every possible means would be adopted to discourage the abuses referred to. The medical officers are bound to attend on all tickets issued by persons authorised for the purpose ; but the Committee of Management may reasonably remonstrate with those who give tickets under which abuses arise.

Letter marked read.

ATHY BOARD OF GUARDIANS.

FEE FOR LUNATIC CERTIFYING.

DR. HOBSON wrote declining to accept of a fee of £1 which the guardians decided on paying him for examining a supposed lunatic. The magistrates had previously made an order for £2.

The Clerk was directed to inform Dr. Hobson that the guardians had decided on the amount, and would not increase it.

ENNISCORTHY DISPENSARY DISTRICT.

AT an election to select a medical officer to fill the vacancy in the above dispensary district, caused by the death of Dr. Goodisson, Dr. Thomas Kelly was appointed. There were two candidates—Dr. Kelly and Dr. Drapes. On a poll 12 voted for Dr. Drapes, and 17 for Dr. Kelly.

BLESSINTON AND BALLYMORE DISPENSARY.

To the Editor of the Leinster Express.

SIR,—In reference to an allegation made by Mr. Cogan, M.P., at the last meeting of the Dispensary Committee, held here on the 9th June, and which has appeared in your issue of the 17th inst., to the effect that I have been in the habit of sending dispensary patients to purchase medicine at their own expense at the apothecary's in Blessington, I beg to give the statement my most unqualified denial. This assertion, founded upon what grounds I do not

Digitized by Google

know, has been made in public, and in public I deny the truth of it.

Audi alteram partem. Not only have I never put dispensary patients to the expense of purchasing medicines, but very frequently I have furnished them at my own cost. where medicines most suitable to individual cases were not in the dispensary.

"The evil that men do live after them,
The good is oft interred with their bones."

I am reluctantly obliged to blow my own trumpet in self-defence, as I consider the public should, in justice, be acquainted with both sides of the question.

Yours faithfully,

LESLIE MATURIN,
Late Medical Officer Blessinton and Ballymore Dispensary District.

PARSONSTOWN GUARDIANS.

THE SANITARY OFFICERS' DUTIES.

WITH reference to this question debated frequently of late at this Board, the following communication was now read from the Local Government Board :—

"In reply to the resolution passed at last meeting requesting to be informed whose duty it is to see that the orders of the sanitary authority for the abatement of nuisances are carried out, the Local Government Board stated that in the communication already addressed to the guardians by the Board, it is appointed that thie duty devolved on the executive sanitary officer, and it remains for the guardians themselves to see that their officers discharge the duties imposed upon them. At the same time the Board added that they saw nothing unreasonable in calling on the sanitary sub-officer to assist the executive officer in such cases."

The Clerk said he could not possibly undertake the duties.

Dr. Woods thought that the executive officer should call on the sub-officer to inspect the premises ; they hardly meant, in his opinion, that the Clerk should visit every case.

The Clerk—The Board has clearly pointed out that on the executive officer (meaning the Clerk) the duties referred to devolved, and these were duties he could not possibly undertake. He said that one thing was certain, and that was the impossibility of complying with this last order, Were he to do so he should be on the road every day. What they should do, in his opinion, was to take the salaries from every one of the officers and give all to one man who could devote his whole time to the work.

The guardians doubted the possibility of such an arrangement.

The Clerk said he had made up his mind to resign the office. The letter only reached him that morning, and he would take a few days to consider the matter.

Dr. Woods questioned whether he would be permitted to resign that portion of his office.

The Clerk presumed he would.

The Chairman supposed that if the Clerk carried out his duties he should go from one end of the Union to the other. He thought they had better let the subject rest for a week, at all events.

DONAGHMORE UNION.

SUPERANNUATION.

A LETTER was received from the Local Government Board pointing out that in the calculation of the superannuation allowance to Dr. White £8 entered as fees for the examination of lunatics should be omitted, and the superannuation allowance reduced proportionately. This would make the allowance £84 18s. instead of £86 13s. 6d., and the Local Government Board requested the guardians to make the necessary correction.

Mr. Walpole said he was not aware that the £8 for fees were included in Dr. White's emoluments.

After a brief discussion it was struck out by the guardians, in compliance with the request of the Local Government Board.

MOUNTMELLICK UNION.

FEES FOR EXAMINING DANGEROUS LUNATICS.

A LETTER was received from Dr. Tabuteau inquiring why he had not received a fee of £2 for examining a dangerous lunatic, for which the magistrates at Portarlington Petty Sessions had certified.

The Clerk said the Board had refused to pay Dr. Tabuteau more than £1.

Mr. W. H. Cobbe—Let him process the Board ; that is all he can do.

Mr. Gaze—There were two process at the last sessions, and there were decrees against the Board in both.

Mr. Thomas Cobbe thought that any doctor would make these examinations for £1.

The Clerk—I believe there was no second visit, but he had to go to Bishopswood.

The Chairman thought that £1 would have been sufficient remuneration ; but as the magistrates have certified for £2 he thought they should pay the amount.

The Clerk thought it right to inform the Board that he had heard it was Dr. Tabuteau's intention to fight the matter He (Dr. Tabuteau) would apply for a mandamus, and any one who voted against paying the £2 would have to pay the costs.

Mr. T. Cobbe said that if the magistrates went on granting certificates for such large amounts the guardians should grant out-door relief to every one who applied for it. The magistrates were showing them an example of wrong doing.

Mr. J. Dunne, jun., thought £2 was too much, but then they had no right to refuse to pay it when the magistrates had certified for it.

Chairman—The amount to be paid under protest. Will that do ?

An order was then made for the payment of the amount.

THE FEE FOR CERTIFYING LUNATICS.

The Clerk read the following letter :—

"Local Government Board, Dublin,
"30th May, 1879.

"SIR,—The Local Government Board for Ireland acknowledge the receipt of the minutes of the proceedings of the Mountmellick Board of Guardians of the 24th inst., and with reference to the guardians' resolution inquiring whether they can be brought to the Queen's Bench by *mandamus* to pay the sum of £2 ordered by the magistrates at petty sessions to a dispensary medical officer for his services in the examination of a dangerous lunatic, the Local Government Board for Ireland desire to call the guardians' attention to Section 14 of the Lunatic Asylum (Ireland) Act, 1875, and to state that the guardians are bound to comply with the order of the justices for the reasonable remuneration of the medical officer who examines the lunatic, and for the payment of all other reasonable expenses in or about the examination of such person, provided that the amount does not in the whole exceed £2.

"By order,
"B. BANKS, Secretary."

Mr. W. H. Cobbe observed that some magistrates did not appear to know it, for they gave what was not reasonable to the medical officers for certifying lunatics. He held that what was reasonable was the fee the doctor would take in his private practice.

BOYLE UNION.

PRESENTATION OF MEDICAL RELIEF TICKETS.

THE Local Government Board wrote respecting the minutes of the Board of Guardians on the 23rd May, containing a resolution relative to the proposal of the committee of the management of the Boyle Dispensary District that a stated hour be fixed for the presentation of medical relief tickets to the medical officer of the district, and all such tickets to be left at the medical officer's residence each day before 12 o'clock noon, except in cases of midwifery. The Local Government Board disapproved of the proposed change, and enclosed a copy of a letter which they have addressed to the committee of management on the subject, calling their attention to the memorandum printed on the back of the medical relief ticket, Form E. 2, which declares that the said ticket may be presented to the medical officer at the dispensary within the hours of his attendance there, or may be presented to him or left for him at his residence, or may be presented to him personally anywhere.

It was ordered that a copy of the letter be sent to each medical officer and dispensary committee in the union.

The following letter was read :—

"Keadue, May 5, 1879.

"GENTLEMEN,—On Saturday last, the 3rd inst., I received a visiting ticket for an old man. I attended the same evening and found his was a case of destitution, and not one requiring either medicine or medical aid, and that I was brought to see him merely for the purpose of procuring him out-door relief. I would respectfully ask the Board whether I am supposed to combine the offices of both medical and relieving officer. I am perfectly aware that in cases of illness it is my duty, as medical officer, to give certificates when called on as to the fitness or unfitness of any dispensary patient to be removed to the Union Hospital, but I can't find that it is any part of my duty to give any order for removal to the workhouse, or for out-door relief, in the case of a person who is not sick, and requires no medicine, but is simply poor and destitute, and suffering from the natural infirmity of old age. I may add that this case is only one of several in which I have been sent for merely for the purpose of getting the recipient of the ticket out-door relief.

"Your obedient servant,

"JOHN B. DRAPES, Med. Officer.

"To the Boyle Board of Guardians."

Mr. Lawrence—I think the same doctor gets very few tickets.

Mr. Martin—I think the relieving officer sent for the doctor, as the man was so much debilitated he feared he was not fit for removal to the workhouse.

Subsequently the relieving officer who issued the ticket in question having come before the board, said he was no doctor, and when he found the man lying in bed he could not say whether he was sick or not. If he attempted to remove the man to the workhouse, and he died on the way, he (the relieving officer) would be responsible.

Dr. H. O'Farrell—As a supplement to that letter from Dr. Drapes I may state the following : A man applied less than three weeks since for out-door relief and was refused. He went home, and five days after the guardian of the district issued a visiting ticket, and when the man, who lives six miles from here, was visited, he said he did not want medical advice but out-door relief.

Chairman—That was a very hard case on the doctor.

Dr. H. O'Farrell—I understand the duties of a medical officer are to give medicine and medical advice to sick people ; they are not to act as relieving officers, certainly. I got a visiting ticket about three weeks ago, the object being to ascertain whether a woman had been confined or not. There is another specimen of the abuse.

The Clerk said, in reply to the chairman, that he thought they should mark the letter "read ;" it would go before the Local Government Board and they would see it.

ATHY UNION.

MEDICAL OFFICERS' SUBSTITUTES.

Mr. M'Laughlin called the attention of the board to an application from Dr. Symes for payment for his services while acting as substitute for Dr. Percival. A short discussion ensued, in which the opinion was expressed that as Dr. Percival was absent as witness on a trial for which he was well paid, he should pay his own substitute.

MEDICAL EXAMINATION OF A LUNATIC.

Dr. Hobson wrote declining to accept of the sum of £1 for the examination of a lunatic, the magistrates having certified for £2, which the guardians subsequently reduced to £1.

Mr. Whelan—I propose that the doctor be paid the full amount. You paid a very poor compliment to the magistrates who signed that certificate.

Mr. Redmond—There is not a person in this room who would pay those gentlemen a bad compliment ; they were both present when we reduced the amount, and they consented.

The letter was marked read.

PARSONSTOWN GUARDIANS.

THE SANITARY OFFICER'S DUTY.

THE following correspondence was read, raising the question as to whether it was the sub-sanitary officer or the sanitary officer who had the duty of making re-inspections with the view of seeing that notices to abate nuisances are duly complied with :—

TO THE LOCAL GOVERNMENT BOARD.

SIR,—I beg most respectfully to ask the Local Government Board on whom does the duty devolve of re-inspection (after the time allowed in the notices served on defaulters under the Public Health Act of 1878, has expired) to ascertain if the nuisance complained of be abated or not, whether on the sanitary officer or sanitary sub-officer in my district, which comprises half the Union. I could not, as sanitary sub-officer, accomplish the re-inspection referred over so large an area without my duty, as relieving officer, being seriously neglected. There are five dispensary districts, and consequently five sanitary officers. Therefore, it appears more reasonable to suppose that the five sanitary officers would be better able to do the duty referred to (each in his respective district) than that one sanitary sub-officer could do it. Besides, in cases of prosecution, I feel confident a successful issue could not be obtained unless upon the evidence of the sanitary officer and not upon the evidence of the sanitary sub-officer. Therefore, it would turn out to be a waste of time and trouble—the re-inspection made by the sanitary sub-officer.—Your obedient servant, JAMES L. DOOLY.

Local Government Board,
May 23, 1879.

SIR,—I am to state that by the sanitary order of 9th Sept., 1874, it is provided under the head of executive duties that the executive sanitary officer shall from time to time take the directions of the Board of Guardians on all sanitary questions and sanitary reports, and all proceedings arising thereon, and shall see that the same are carried out and brought to a conclusion. It is, therefore, the duty of the executive sanitary officer to see to the carrying out of orders, such as those referred to, and in the discharge of this duty he may avail himself of the assistance of the sanitary officer or sanitary sub-officer as he may find necessary.—By order, B. BANKS.

The Clerk said that since the Act had came into force this was the third communication which had passed on the same question. None of the doctors, as sanitary officers, objected to undertaking the duty, except Dr. Wallace, who had first raised the point.

The Chairman thought it was the doctor's duty.

DISPENSARY MEDICAL OFFICERS AND CERTIFICATES OF REMOVAL.

To the Editor of the *Waterford Express*.

DEAR SIR,—I have read with interest your report of Union in last week's issue as follows :—

INCREASE IN OUT-DOOR RELIEF.

Mr. Fisher.—I wish to know from Mr. O'Shea why the relief in kind has increased. It was £6 18s. 6d. four weeks ago, and now it is £11 8s. 2d.

Mr. O'Shea.—There are a number of cases in which the doctors refuse to certify that they are fit to be removed to the hospital.

Mr. Fisher.—We are in a rather anomalous position. The doctors are appointed by the dispensary committee, though we pay half the salaries, and the Government the other half, but strictly speaking they are not our officers, and they are in this unhappy position—though they may think that it would be better for the poor to remove them to hospital, they know if any fatality occurs they may be subject to censure.

The Clerk.—If a death takes place within forty-eight hours there will be an inquest.

Mr. Fisher.—And perhaps there will be an inquiry, and the doctors may be censured. The result is that these poor sick people are kept in wretched dens instead of being sent to hospital.

Chairman.—The doctors are very cautious. They do not like to incur blame.

Mr. Fisher.—But the ratepayers are put to needless expense, and the poor are the sufferers.

Mr. Leamy.—I expect great good will arise out of this discussion.

Mr. Fisher.—The poor are suffering from the insane interference of the Local Government Board.

Originally the Poor-law system did not in any wise require the medical officer's opinion, and the regulation directing him to supply a certificate to board of guardians or relieving officer as to state of health of a patient, was in reality merely a direction to certify to a fact, such as—"I certify that A. R. is suffering from bronchitis." But it was altogether a different matter to make it compulsory on the medical officer to certify as to his opinion of fitness or unfitness for removal, inasmuch as this latter is a certificate of an opinion, expressed as if the mere opinion were as positive a fact as the certificate quoted above. This is what we object to—and, to make matters worse, the poor patient undergoes an experiment, in proof of the accuracy of the opinion, and if the experiment of removal does not result successfully as regards the patient, the doctor gets all the blame. This "fitness for removal" order was superadded to the original direction in the year 1869. Ratepayers are naturally anxious to effect removals, as the in-door cost is far less than the out-door in such cases; and in a like degree relieving officers are anxious, for each removal tends to place the R.O. in a favourably economical light before the board of guardians. The medical officer alone has nothing to gain, but incurs all the risk, and practically becomes the removing officer himself. Great pressure is very often brought to bear on the doctor to obtain this certificate, and the result is frequently most disastrous to him. On the other hand, a certificate of *unfitness* is at times a most dangerous document to issue, and unless under certain circumstances, may be as unhappy in its results as the other form. Altogether the order is regarded by medical officers as a very oppressive innovation. The relieving officer is the removing officer, but, in reality, the effect of the present system makes the medical officer the removing officer, as well as the "scapegoat" of the whole matter. Of course, I write from a dispensary doctor's point of view.

Yours truly,

J. B. NORRIS-CANE.

TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. JACOB, at the Dublin offices of this paper.

ON THE DIFFICULTIES OF DIAGNOSING VENEREAL DISEASE IN WOMEN.

By C. H. F. ROUTH, M.D. Lond.,

Senior Physician to the Samaritan Hospital for Women and Children, &c.

GIVEN a woman affected with syphilitic or gonorrhœal disease, can the disease always be made out as such? And the converse proposition, given a woman certainly not affected with either disease, is it always possible by examination of her person to say that she is not labouring under a venereal affection? To both of these propositions I answer unreservedly in the negative.

I. Let me take the first proposition. Here is a known case of venereal disease. Can it be made out as such?

We are told by the latest writers: that there are three forms of syphilitic sores, as described by the Government Committee on syphilis: One characterised by induration throughout its entire course; one soft in its early stage, and becoming subsequently indurated; and one soft throughout its whole course, but which unlike the simple local sore, is followed by constitutional disease. Hard sores do not of necessity give rise to syphilis, whilst soft sores may; and it is an undoubted fact that the question of induration or non-induration is greatly determined by the position of the sore. Chancres upon the female genitals, simple or syphilitic, and chancres upon the glans penis, are rarely hard. ("Bryant's Surgery," ii., 171).

Here, then, we have an admission that the appearances and course of a syphilitic sore are so varied, that the hardness of a chancre is no criterion of syphilitic disease, especially in a female.

But Mr. Byrant goes on: "A crop of soft sores fringing the prepuce or surrounding the corona is, in all probability, a simple and non-syphilitic disease. A spreading chancre, with a suppurating bubo, is probably a local affection. A small single chancre, indurated from the beginning, is the most suspicious of syphilis, although, even in this, there is no certainty of its being so. In fact, it is not possible to speak with any certainty as to a chancre being syphilitic or otherwise. Syphilis is a constitutional disease, and is to be recognised only by its constitutional symptoms, not by the point of its inoculation." (*Ib.* p. 272).

Now, if this be true of men, whose parts are all external and very discernible, will it not be still more true of women, whose parts are nearly internal, and whose large rugæ are so apt to hide and cover an infected spot? Indeed, I may allude as an example of the troublesomeness of making out a small diseased point in the vagina, to the difficulty of diagnosing a small vesico-vaginal, or vagino-rectal opening. In the former case the urine leaks through it, in the latter, flatus from the rectum passes, so that the woman is quite cognizant of the existence of openings, and yet the most careful and prolonged examination has failed to discover either, which have only been made obvious by the injection of some coloured fluid in the one passage, which is only detected by the transit of the coloured fluid into the other passage. Where we have to do with women, specially old hands, and in whom the vaginas are extremely loose and capacious, the difficulty is considerably enhanced.

In rare cases where the uterine cavity is affected, the same difficulty obtains as in chancres within the urethra of the male; no kind of inspection will clear up the difficulty. But in the case of the uterus, another source of sore exists. In many women in whom chronic inflammation of the cervix has existed, we have a hardened base, and if upon this a superficial sore exists, the diagnosis between it and a syphilitic sore is simply impossible either by ocular inspection or the touch.

Let us now take a converse proposition. A perfectly pure woman, who has never gone wrong herself, whose husband has been, except with herself, perfectly chaste, and in whom, after the most careful examination, we can find no trace whatever of syphilitic disease. I admit such purity on the male side may be rare, but in this case I assume it is an undoubted fact. Well, she feels sore, complains of a discharge, more or less muco-purulent, feelings of discomfort perhaps during connection, or after exertion. I examine her. Find superficial cervical ulcers over the cervix. They do not heal readily, but still after a time do cicatrise. By-and-bye, a child is born. There is some

Digitized by Google

redness about the child's privates, and soon snuffles develop, and points of ulceration occur in the nasal mucous membrane, and after some ineffective treatment the child dies. I can put down this death to nothing short of syphilis, and yet in neither party is there any trace of syphilis. Even if I could have discovered any trace of cicatrisation anywhere, which can be detected so readily in males, the very parturient functions of a woman, who may have been torn or abraded in the mucous membrane during labour, render such a discovery valueless as to the pre-existence of syphilitic disease.

Take, again, another case. A number of men have connection with a prostitute. She is an old hand. She has had syphilis formerly, but has been cured. Nearly every man who has to do with her becomes syphilitic. Well, I examine that woman over and over again, and find no disease whatsoever in her. What is the explanation? That given by Mr. Worth and Dr. P. A. Taylor I think is the correct one. This woman is in a state of syphilisation, and incapable to a great degree of contracting syphilis. In other words, syphilitic discharges from impure men may lodge in her vagina innocuously to herself; but, coming in contact with the parts of other men, who also make use of her, they become diseased by the contact of her vagina. Another reason is probably that which obtains for circumcised persons—the mucous membrane of an old hand is more skin-like from exposure, and less liable to infection, than that of one less addicted to an impure life.

Both these examples, however, are examples where no syphilitic disease could be detected in the woman, and yet in both she was infectious.

But now we come upon a more difficult class of cases still. It is that a woman may be quite free from any sore whatsoever, and yet the secretions from the vagina will produce syphilitic sores. Now I am pleased to be able to take my evidence on this point from the late Mr. Morgan, Professor of Surgical and Descriptive Anatomy at the Royal College of Surgeons of Ireland, and Surgeon to Mercer's and the Westmoreland Lock Hospital, Dublin, because, besides being a specialist in venereal diseases, he was also a known advocate of the Contagious Diseases Acts.

He states distinctly: "The non-existence of a genital sore in the female is no absolute guarantee of the non-existence of contagious power ("Origin and Progress of Venereal Disease," p. 8.), the vaginal secretion in some cases being capable of producing a soft contagious characteristic sore when inoculated beneath the skin." In one case he performed auto-inoculation from a female; twenty-eight days subsequently (about two to three weeks after the healing of the primary sore), he successfully inoculated another woman from her vaginal discharge, producing a characteristic and vigorous chancroid pustule about 3½ months after her first perception of the primary sore. Upon this case Mr. Morgan himself volunteers the remark which with my predilections I might have made—"This is to be borne in mind with respect to the conduct of inspectors under the Contagious Diseases Acts, as it might be supposed that freedom from primary or actual sore obtained freedom from contagion. Yet a vaginal secretion in a syphilitic patient might be overlooked. I am rather inclined to believe that the reason for the comparative frequency of the occurrence of soft or chancroid sores on the Continent, and where governmental supervision is exercised, is due to the fact that primary and external sores are at once detected on inspection, and the patient is confined to hospital till cured, but that the vaginal discharge is overlooked, or its discovery guarded against by the patient."

This secretion need not be very purulent, as Mr. Morgan goes on to tell us, provided it does contain some pus globules scattered throughout. He also points to the fact of the frequent co-existence of a vaginal or apparent gonorrhœal discharge, with secondary symptoms, and refers to a Government Return from the Cork Lock Hospital. Thus, out of 326 cases treated there since June 15, 1869, about 100 were cases of sores, the remaining 226 cases of gonorrhœa, several of which were complicated with various forms of secondary, the majority of the complications being mucous tubercles in and around the vulva (p. 9).

These facts prove to us that the ordinary method of examination and curative treatment, followed by those who carry out the Contagious Diseases Acts is insufficient, and it points out two necessary circumstances to avoid contagion—1st. Every loose woman *before* and *after* connection must have her vagina efficiently washed out, to remove any contagious secretion formed within it, or left within it by some previous infected man; and 2nd. Every woman must be inoculated before sent away as cured, and, so long as she is auto-inoculable, kept in durance vile.

The first is simply impracticable, and would necessitate the daily and hourly presence of some lewd keeper to see that the necessary ablutions are carried out. The second would lead to such prolonged imprisonment that no government could dare to carry it out; and yet, if my premises are true, and I believe they are incontrovertible, there can be no real safety in the visitations as now made.

II. Let me now pass on to the second part of my subject, gonorrhœa. What constitutes gonorrhœa in the female? and how far does an examination of one so infected justify us in concluding that a woman is not capable of producing gonorrhœa in a male?

Now I can confidently assert that vulvitis in children, simple vaginitis in other women, endometritis, leucorrhœa, menstruous fluid, and occasionally ulcerations about the cervix uteri, are all and severally able to produce gonorrhœa in the male, and I shall endeavour to prove the assertion by cases.

The first of these positions, the existence of a copious secretion, not distinguishable from gonorrhœa even in very young children, is indisputable. Like otitis, it may be peculiarly excoriating, even offensive, and sometimes very copious, and the annals of medicine record a large number of cases where the charge of rape has been brought against men affected with gonorrhœa, because they had been in the company of children so affected. It is, I think, unnecessary that I should dwell further on this point, but I may in passing allude to masturbation in the female as a cause of this disease. In an institution with which I happened to be connected some years back, through the admission of one masturbator, the habit became propagated amongst the other girls. In several of these vulvitis and œdema of the labia resulted. When these symptoms had subsided, generally extensive vaginitis was found to prevail higher up the vagina, and the secretion was in no way to be distinguished from gonorrhœa.

And now as to vaginitis in a fully developed female, I frankly confess my utter inability to distinguish the disease from gonorrhœa. I have seen it arise spontaneously in both the married and the unmarried, the young and old, sometimes more acutely than at other times. Sometimes I have been able to trace it distinctly to exposure to cold, sometimes to violence on the part of the husband. One poor lady of a delicate, scrofulous conformation, and who was married to an unfeeling, brutish husband, peculiarly largely developed in his organs of sex, is seldom two months without an attack of vaginitis, which is quite undistinguishable from gonorrhœa, and would, if neglected, be as severe and intensely inflammatory. Fortunately, using the remedies, of which she is fully cognisant, it is usually controlled after a few days. Such vaginitis is doubtless contagious, but it is no evidence of impure connection. But I can go further. I have seen cases of pure leucorrhœa which have given rise to gonorrhœa in the male. Indeed, it would seem that in some women immediately preceding and succeeding a menstrual epoch, a leucorrhœa becomes sometimes offensive, sometimes purulent, and certainly has become contagious in many cases and productive of gonorrhœa in the male.

I have seen the same result follow connection with a woman during a period. In the case of a postman who was very fondly attached to his wife, in a moment of weakness he forgot himself and had connection with his wife while unwell. The result was one of the most

Digitized by Google

severe cases of gonorrhœa that I have ever treated. In fact, it lasted over three months. Yet she continued uninfected, doubtless because conjugal relations were necessarily suspended while the husband was unwell, and yet no other source of contamination could be traced in the man. Other cases are also recorded. The menstrual epoch in some women gives rise to a peculiar concomitant irritant secretion, which exaggerates infective powers, and this is equally the case when a woman is affected with syphilis. The virus is then more active and contagious.

But I have seen even ulceration of the cervix produce gonorrhœa in the male. Let me give you a remarkable case:

Some years ago a lady was married to a gentleman whom she did not very much like, by the forced commands of her parents. In due course of time they had a child. One day the husband found himself affected with a discharge. Alarmed, he sought the assistance of a practitioner, Dr. C. P. C. That gentleman at once stated the disease to be gonorrhœa, and that unless he himself was the culprit his wife was. Thereupon, the irritated husband, conscious of his innocence, returned home, and showing his wife the prescription, accused her of infidelity, and turned her out of his house. Distracted, she sought another physician of the same initials, Dr. C. P. Collier, who sent her to Dr. Greenhalgh for examination. Dr. Greenhalgh subsequently sent her on to me. We examined her separately, and then together. A small ulcer, about the size of a pea, existed close to the os uteri, of a scrofulous character, discharging an ichorous sanies, so acrid that it at once corroded a knife with which it was touched. The patient herself was quite free from gonorrhœa. We had no hesitation in giving a joint certificate as to her innocence, and the husband took her back again; but the example proves how careful we should be in giving an opinion in such cases until all particulars have been inquired into.

I shall, in the last place, allude to those cases of acute fundal endometritis, as well as its more chronic form, in which, if connection take place, a very severe gonorrhœa is likely to be developed in the male. This disease, called by some acute perimetritis, sometimes puerperal, sometimes accompanied with ovaritis and inflammation of the Fallopian tubes, has been supposed to be a result of gonorrhœa, communicated by the male to the female, and producing these symptoms in lieu of the ordinary sores of gonorrhœa. I am sure I have seen such a sequence occasionally, but I indubitably know of other cases where a perfectly healthy man has been infected by his perfectly innocent wife with gonorrhœa when she has been suffering from acute fundal endometritis. Indeed, the death of the wife has followed in some, while in others the most severe amount of peritonitis has occurred. In both cases, however, the husbands suffered under most severe gonorrhœa, and in both the wives were perfectly chaste. I have observed similar results where the disease has been less acute. But if these examples had occurred among prostitutes, or even only dubious characters, would it be right to say such women were impurely diseased? Certainly not.

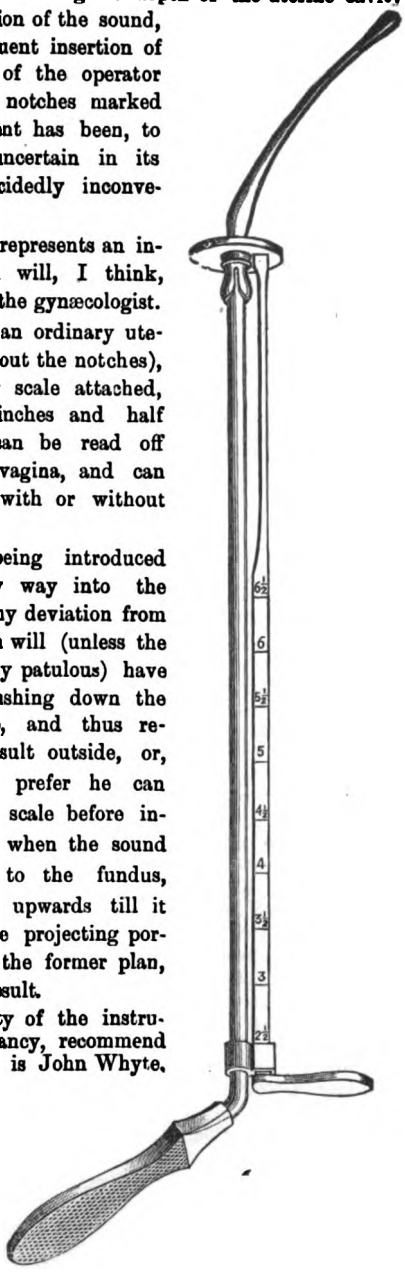
The two conclusions to which I come to are first, that with regard to syphilis, the mode of examination is totally inadequate, without incubation, and therefore ineffective. To make it so would be simply impracticable.

And with regard to gonorrhœa, that a disease may be produced by vaginitis, vulvitis, menses, ulcerations, uterine inflammations, all of which, as possible to occur among the most innocent of women, and the most respectable, altogether belie the charges of impurity, and the conclusions from forced examinations made by the advocates of the Contagious Diseases Acts.

NEW UTEROMETER.

By ALEXANDER DUKE, L.R.C.S.I., L.K.Q.C.P.I.,
Assistant Physician, Rotundo Hospital.

THE plan of measuring the depth of the uterine cavity by the introduction of the sound, and the subsequent insertion of the finger nail of the operator into one of the notches marked in that instrument has been, to say the least, uncertain in its results and decidedly inconvenient.



The woodcut represents an instrument which will, I think, prove useful to the gynæcologist.

It consists of an ordinary uterine sound (without the notches), but with sliding scale attached, graduated in inches and half inches, which can be read off exterior to the vagina, and can be used either with or without the speculum.

The point being introduced in the ordinary way into the uterine cavity any deviation from its normal depth will (unless the os be exceedingly patulous) have the effect of pushing down the measuring scale, and thus registering the result outside, or, if the operator prefer he can draw down the scale before introduction, and when the sound has penetrated to the fundus, slide the scale upwards till it meets the os, the projecting portion will, as by the former plan, give a similar result.

The simplicity of the instrument, will, I fancy, recommend it. The maker is John Whyte, Dublin.

THE HISTORY OF A DISPENSARY DOCTOR.

[WRITTEN BY HIMSELF.]

CHAPTER II.

Dr. Scalpel describes a "dispensary day," and is asked to dine with a doctor of the old school, who gives him some valuable advice.

HAVING duly altered the name on my signboard by substituting my own name for that of my predecessor—a job which was done by a local artist, who performed it in

Digitized by Google

a diminuendo style of decoration, beginning with a very big D, and ending with a very small L—I calmly awaited my first day on duty at dispensary. Having been resident in an hospital for some time, I expected something in the hospital way, a little more uncivilised perhaps, rougher and less polite, but still an orderly set of people, eager to avail themselves of my skill, and the really excellent medicines afforded by the Board. God bless my ignorance! such a set of old women of every age and style, old women lank and thin, with faces unwashed since they were married, with churchyard coughs which all the recipes in the world would not obliterate; old women fat and greasy-looking, with bowels defying gamboge and croton oil, belching wind like Boreas, and requiring veterinary doses of salts and senna to relieve them; old men with chronic ulcers which had defied the united skill of all the surgeons for dozens of miles around. Beggar-women of all ages and sizes resorting to the dispensary for supplies of salts and senna, castor oil, and warming plasters for distribution among their patrons, the farmers' wives. Little children brought by mothers with the unfailing disease of worms—no matter what ailed them, it was worms were the matter and powders the remedy. In they poured, half the population seeking remedies for incurable complaints, or impelled by curiosity to see the new doctor. Quinine they spat out as poison, bitters they rejected with scorn as attempts upon their lives. Warming plasters were their great remedy, which they believed could cure "the gout, the colic, and the phthisic." The quantity of purgative medicine they had to take would be incredible to any one one but a physician accustomed to the enormous doses they at last came to, from constantly using opening medicine. One old woman asked for a dose of castor oil. I gave the usual quantity. "Arrah, what good is that, sir?" said she. "Well," said I, "take your usual dose." She filled the teacup of castor oil. Thinking that she intended to distribute it to the farmers, I said, "My good woman, you must take that dose before you leave the dispensary." Down it went without hesitation. I am glad to be able to say I saw the same woman a few days after, to all appearance none the worse for "her usual dose." One woman came in in a great hurry, saying her daughter, aged about eighteen, "was took very bad with a cutting." I gave her, as she said she had been suffering from constipation, a couple of rhubarb pills. The woman asked me how they were to be taken? I told her, the usual way, to take them one after another, and to follow them with a few spoonfuls of water. The same woman came back again in about half an hour asking me to see her daughter, who was in a dying state, or as she explained it "waiting for the hour." I found the girl suffering from an ordinary bellyache, and asked if she had got the pills.—"Sure there wasn't time, doctor," said the old woman, "but they're down." "They are down?" said I. "*Didn't you tell us to give them in some water, and shure the water hain't biled yet,*" added the old hag, pointing to a saucepan of water simmering on the fire. Exit doctor, with a look of extreme disgust. There was nothing annoyed and fretted me so much at first as the extreme carelessness of the people: when you were explaining to them how to do this, and that, and thinking how clear you were making it to them, you caught their eyes examining your bottles, or intensely engaged watching a cock fight out at the dispensary windows; and when you asked them to repeat your directions, what they said was so often the very opposite of what you had ordered, that I would defy the meekest saint in the calendar not to lose his temper. Oftener than not they came to treat themselves: they wanted "oil of Bays," (*Hibernice* for ung. hy. fort); they wanted red "percipitate" (*Anglicé* precipitate); they wanted "corrosim sublimum" or white copperas, or a "vomit." All pills were "bitter holloways," and Burgundy pitch was in great requisition; in fact, the whole dispensary was in a state of anarchy. The former doctor sat in his chair, easy man, surrounded by salts and senna, castor oil, warming plasters and cough mixture, and distributed to each, "severally as they would." A bitter fight I had of it, you may be sure, when I began by refusing to give any medicine, except what I thought suited to their several ailments. A bitter fight I had, for many a long a day, but I conquered in the end, having received many a wish, which were it as easily accomplished as uttered, would hardly allow me to write these words. At length the two hours expired, and I shut up shop. On my arrival at my lodgings, I was told Dr. Regan had called to visit me, and was in the sitting room. When I entered he jumped up, and shook me warmly by the hand. "I knew your father, sir, and your mother, sir"—every word was accompanied by a shake—"A very good lady, your mother was, sir. I knew you a boy, sir, a mere child, sir, an infant, sir." Having shaken the hand off me, and shaken all the breath he had in his body out of himself, he at last sat down, though a jerk of the arm now and then warned me that very little would make him begin the process over and over again; so I sat at some distance, and took a survey of him while he recovered his breath. I saw he was a man of small size, with a face which much belied him if he was not fond of good living. He was close shaved, his hair was white and very thin, he wore a white tie, and had on an evening swallow-tailed coat, which I afterwards saw was what he always wore. He had put himself into a violent heat, and sat mopping his forehead vigorously with a huge red-and-yellow silk pocket-handkerchief; stopping now and then to ask me questions, so rapidly put one after another, that it was with great difficulty I could answer them sufficiently quickly.—"Edinburgh man, I suppose?"—"Oh no; Dublin." "Very good, sir; nothing like a University education. *Emollet mores!* You know the rest. I'm Edinburgh myself, sir; and Paris. Delpech was a great man, sir; and Dupuytren; and that fellow that used to bleed everyone, had a cup of blood by every patient's bedside every morning, and dosed him accordingly. Great surgeons, sir, great surgeons, but d—d dirty.—I had great fun, to-day, sir," said he—laughing so pleasantly, that it was quite infectious—"I had great fun with a schoolmistress. I was talking in my study to my nephew—young McMaster, just passed the L.R.C.S.I., you know—when a great double knock came to the hall-door—I mean, you know, I heard it. 'Bedad,' says I, 'Johnny, that can't be less than Lady So-and-So.' So I sat down in as dignified and professional an attitude as possible. The door opened, when who should come in but Miss ——, the village schoolmistress, of Kilmarnock. 'I would feel obliged,' says she, 'doctor, if you would be so kind as to perform the operation of extracting one of my offending and excruciatingly painful molars, for which I will feel myself under the deepest obligations, pecuniary and otherwise.' 'Bedad,' said I, 'Johnny, tis' grand to have the eddication, and to be able to spake English like that. Run up, like a good boy, for Johnson's Dictionary, and we'll interpret. 'In the meantime,' said I, taking a chair, and planting it in the middle of the room, 'sit down there, an yr—please, Ma'am.' The look of offended dignity she gave me was splendid. Ah sir," said he, heaving a deep sigh, "times are changed. However, come over and dine; boiled leg of mutton; can't expect much from an old bachelor, you know. However, I'll give you some advice which will be useful to you. Six o'clock, sharp!" cried out he, as he got into his gig, and whipping up the old horse, soon disappeared round the corner. I have purposely introduced Dr. Regan to my readers' notice, as the type of a country practitioner of the old school, now rapidly passing away, as Dr. Regan has passed away himself. Receiving the highest education, he settled in a neighbouring town, where, holding a Poor-law appointment, he rapidly rose to have a large and extensive practice. Friend alike of gentle and simple, he was widely known and respected. Originally well educated in his profession, some forty years of experience had made him a man whose opinion was sought for far and wide. Shrewd to a degree, and able to read the man he was dealing with

Digitized by Google

at a glance, he often accomplished by managing and persuasion what he could never have done by mere drugging. He was a bachelor, and kept an open house for all his clients and friends. He loved a good horse, a good glass of wine, and a good dinner; and unless Mother Scandal belied him, knew a pretty girl when he saw one. Such was the man who invited me to dine, and under whose "mahogany" I, to use his own expression, found my legs in due time. (*a*) "Fall in," said he, as he sat in his arm-chair, his legs stretched out, and a glass of real red port at his hand. "Fall in," said he, "don't give any opinion; tell them they're weak. Half their time they don't want your physic, they want your opinion. They have money in a stocking or stuck up in the thatch, which they don't wish to have known unless they are sure they are dying; and if you say they are very bad, and they settle it among their friends, and then recover, they will bell you all over the country. If they ask what ailment they have, tell them its on the lungs, or stomach, or other organ. Don't give it a name; don't call it pneumonia, or gastritis, or any other *itis*, for very probably they will go to some other practitioner when they are nearly well, and who will shrewdly see they then only want *tincture of time*, and who will give them some *placebo*, call the disease by some other *synonym*, get all the credit, and put a hole in your reputation. There are lots of these fellows about now," growled the old Edinboro' man. "Multiplication of licensing bodies have made degrees so cheap that every little 'thrawneen' of a farmer has sent the dunce of the family to be made a doctor of, and keeps the clever fellow to follow the plough." On my remarking, I found it so difficult to make the lower orders do what they were told, or remember all my directions, "I tell you what, sir," said he; "all this temperature-taking, and thumping your patient with stethoscopes, only tends to bring you into disrepute. Why, man, they think you are *puzzled and don't know what's the matter*. The lower class of farmers give you more credit for one good shot than if you were to make a dozen diagnoses—admirable in themselves, but taking time to make them out. There is nothing they like so much as a decided answer. 'You'll die or you'll not die;' that is what they often want. 'He hardly looked at me before he told me what was the matter.' If you see any prominent symptoms that make you almost sure they have such a disease, tell them they have such and such symptoms. It never occurs to them that what would happen in one case would happen in another, and they give you credit for great cleverness, and even a kind of second sight. Don't make yourself cheap. An Irish farmer values *nothing except what he pays highly for*. Why I went into a draper's shop some days ago, and was quite horrified at the price a farmer's daughter paid for a dress. Now, I happened to have bought a dress off the same piece for a first cousin of mine," said the old fellow, with a twinkle in his eye, "and I paid just half. I accused the shop girl of charging the farmer too much. 'Goodness help you, doctor,' answered she, 'if I didn't charge the farmers' wives high for an article they wouldn't have it, and go elsewhere.' Make the farmers pay you; the more they pay the more they value it, and the more certain you are of having your directions carried out, and thence of curing your patient. What! Not going? Well, *tempora mutantur*; you know the rest. When I was your age we never went to bed until the sun rose; and I often had to keep my hand in cold water before I could open a vein to get blood. Now they never bleed. Never mind, the time will come round again. Well, good-bye, take care of yourself, the horse looks rather fresh; see you again soon. By-bye."

(To be continued.)

(*a*) It must be distinctly understood that I do not endorse all Dr. Regan's advice. I give it as I heard it. There is a great deal of truth in it, however. I myself know practitioners who have the happy knack of never giving any diagnosis or prognosis. This, I should say, requires long practice.

Translations.

CONTRIBUTION TO THE STUDY OF THE OSSEOUS TUMOURS ON THE EXTERNAL AUDITORY MEATUS.

By Dr. DELSTANCHE, fils, Brussels.

Translated, by permission of the Author, from the "Mémoires Courronnés et Autres Mémoires," de l'Académie Royale de Médicine de Belgique,

By JAS. PATTERSON CASSELLS, M.D., M.R.C.S., Lond.,

Fellow of the Faculty of Physicians and Surgeons; Surgeon to the Glasgow Dispensary for the Diseases of the Ear; Aural Surgeon to the Glagow Royal Infirmary; and Lecturer on Aural Surgery in the Royal Infirmary School of Medicine, Glasgow.

(Continued from page 22.)

THERE is one symptom which never fails to give evidence of its present or past existence, that is otorrhœa.

However, the *rôle* of inflammation does not appear to us to manifest itself with so much evidence in the production of these little and generally multiple exostoses, which develop themselves near to the membrana tympani, whose surface they mask to a greater or less extent. But even here nothing indicates that there is any relation whatever between this form of the affection and the rheumato-gouty diathesis. It will be agreed that the mere finding of multiple osseous tumours in the external auditory canals, in those persons who are gouty or rheumatic, is not sufficient ground for declaring that those growths are caused by these diatheses; besides, facts of this kind must be very numerous, to exclude all idea of a casual coincidence. For the contrary is the rule, in judging of these cases by the facts of our own knowledge. How can we then reconcile these facts with the rarity of exostoses of the auditory meatus, in cases where, according to Toynbee, they ought rather, in preference, to be found.

Nothing in the writings of Triquet would lead us to suppose that he has sought to verify by himself the value of his own opinion, that exostosis, in general, was a symptom of tertiary syphilis, an opinion so little in harmony with that of most of his *confrères*, and which, for that reason, would require to be accompanied with proofs to support it. His remark always indicates to us a way to find the solution. The best way of putting this question to the proof would be to re-examine in this respect (by putting away all preconceived ideas), the greatest possible number of syphilitic subjects. Such is what we have thought, and thanks to Thiry and Guillery, who have permitted us to utilise the vast field of observations open to them in the hospital Saint Pierre, we are, in a measure, able to give the result of our first investigations, as regards the point in dispute.

Unfortunately, the inquiry, which we have undertaken, is not far enough advanced to draw unquestionable conclusion from it; for, up till the present time, we have only met with thirty patients who were, or had been, affected with marked syphilis. This circumstance is not favourable to the realisation of our design, but it testifies highly in favour of the preventitive measures in use against syphilis in Belgium, and of the success which attends the treatment of our eminent *confrères*.

In the cases of veritable constitutional syphilis, our researches have only led to negative results, and what is necessary to note, the organ of hearing was also, from other accounts, in a normal state, which we were far from expecting. But in extending our investigations indiscriminately to all syphilitics, we have met in the category of prostitutes, submitted to the inspection of the police, two remarkable cases of exostosis of the meatus.

Digitized by Google

One of these women, J. K., æt. 23, under treatment for a catarrh of the vagina and bearing no evidence of constitutional syphilis, presented in each ear, close to the membrana tympani, an osseous projection in the form of a crescent. The exostosis extended from the anterior inferior aspect of the meatus, upwards and backwards to its posterior superior aspect. On the left the exostosis was much more developed, as much in thickness as in extent, only leaving between it and the wall, a gap which a grain of hempseed would fill up.

The tumour of the right ear had the brightness and whiteness of polished ivory; that of the left, on the contrary, was slightly tinged with rose-colour, at the time of our examination, and which might have been due to the removal of cerumen, previous to the examination. The hearing in both ears was normal; meanwhile, the patient remembered to have been a little dull during some time in the left ear, without feeling any pain, which probably arose from an accumulation of cerumen.

The other case concerned M. D., æt. 23, woman like the preceding, and like her exempt from syphilis. Her attendance at the clinique of our *confrère*, M. Thiry, had for its object the removal of granulations from the neck of the uterus, otherwise she enjoyed good health. She remembered having had, as a child, otorrhœa in the left ear. Examination ascertained the complete integrity of the right ear. On the left, there existed at about three centimètres from the entrance of the meatus, two osseous tumours, of a milky whiteness and a little turned back, one of which, the smaller of the two, arose from the anterior wall and the other from the rest of the circumference of the canal. Their sides come in contact over a very large extent, but without running into each other at any part, and only leaving a space in the form of a long square, in the centre of the meatus. The hearing distance is reduced on that side to 21 centimètres for the watch, whose ticking on the left side is clearly perceived at three mètres.

One sees from the preceding facts, gathered from our inquiry in the hospital Saint-Pierre, that they do not confirm, so far, the hypothesis of Triquet. First, because the two observations of exostoses gathered by us on this occasion, just show, once more, the possibility of the development of these tumours without the participation of the cause admitted exclusively by that author. Then, because the absolutely normal state in which we have found, without exception, the ears of subjects, attacked with tertiary syphilis, does not testify in favour of the special influence which the syphilitic diathesis has been said to exercise on the production of osseous tumours in the external auditory meatus. Nevertheless, up till the present time, it would be going too far for us to contest that influence in any degree whatever. Also, we must take care in passing judgment between Schwartze's observation, which absolutely rejects all ætiological relations of syphilis with the exostoses of the external auditory meatus, and that of the practitioners who, like Gruber, without making it play the exclusive *rôle* that Triquet attributes to it, nevertheless, think themselves authorised to invoke its influence in some circumstances.

It seems to us that Erhard is quite correct in saying that it has not yet been proved that syphilis, in that relation, exercises a specific influence. But if we agree with him on this point we cease to do so in regard to the possibility of the development of exostosis or hyperostosis in the external meatus of the ear, after the period of ossification of the latter; proofs to the contrary being already numerous. We direct his attention, among others, to the clergyman's case, spoken of by Toynbee (on page 116 of his "Treatise"), where that author, whose scientific integrity or competence Erhard will not dispute, found the right auditory canal, from which he had extracted ten years previously, a voluminous polypus reduced to the quarter of its natural dimensions on account of osseous excrescences being upon its walls and placed in such a way that there was only a small triangular opening through which the central part of the membrana tympani could still be seen, while at the time of the preceding examination the whole surface of that membrane was visible.

It would be easy for us to multply examples of this kind. We will, however, only add one, borrowed from our own practice and still unpublished.

M. D. J., æt. 63, very robust for his age, without any antecedent diathesis whatever, came under notice July 30, 1877, for bilateral deafness, accompanied with tinnitus, that had commenced about a year previously. He had had, eighteen years ago, a fetid otorrhœa on the right side that had come quite unexpectedly and without pain, for which he had been a long time under the treatment of my father. The microscopic examination of the secreted matters made by Prof. Gluge, revealed osseous particles. According to the patient his left ear had always been good till the commencement of the deafness which occasioned his visit.

On examination a large quantity of cerumen, yellow, dry, broken, and mixed with abundant luminated epidermis was found in both ears, whose removal was easily effected by the help of the *curette*.

It was ascertained that both canals, which were very wide to a depth of about 2 centimetres, contracted abruptly at that part. This diminution of the calibre proceeds from an osseous projection that seems to spring from the whole periphery of the canals, with the exception of their superior portion. This gap in the right canal has a rounded form, and is of the diameter of mm. at the most, while the opening in the left ear is oval, and measures 4 mm.

The membrana tympani, completely hidden on the right, is visible in its superior segment on the left. On that side a part of the malleus is seen, and behind the latter a small perforation.

The deafness was due to the obstruction of these gaps by cerumen, and the removal of that matter immediately improved the hearing, without, however, curing the tinnitus entirely.

At the time of the patient's next visit, pulsative beatings had succeeded to the buzzing tinnitus on the right side, very probably caused by the irritation occasioned on the surface of the osseous tumour and on the walls of the canal by the repeated introduction of the probe. That symptom was accompanied by redness and stickiness of the canal, but it disappeared after a slight secretion declared itself, leaving the ear perfectly tranquil. The tinnitus, although mitigated, still persisted in the left.

When the patient was dismissed on the 3rd December, he heard the watch at 6 centimètres on the left, and on the right not quite so well. The hearing, moreover, for the voice was normal.

What is to be noted in this observation is, that the development of the two exostoses, or hyperostoses observed in M. D. J., can only have commenced after the period that my father had attended him, because the latter perfectly remembers having seen no traces of them. In spite of the perforation in the postero-superior segment of the left membrana tympani, the patient persists in maintaining that there never was a running on that side. Perhaps it is necessary to consider it as the result of a purulent otitis in infancy.

Speaking of exostoses in general, Nélaton says they are sometimes sluggish in all periods of their evolution, but most frequently they are painful at the commencement and insensitive when the tumour has reached its full size. As to those of the external ear, they do not manifest their presence by pain, nor even give rise to any symptom of a nature to awaken the attention of the subject, so long as the osseous mass does not prevent the access of sonorous waves to the membrana tympani. Here, indeed, the pain is wanting, and it is at the most a question in some cases of a feeling of pressure in the interior of the auditory canal.

But if there be complete occlusion of the meatus by these tumours, phenomena are called forth identical to those that manifest themselves under the influence of other causes of obstruction, that is to say, on the one hand, a more or less marked deafness, accompanied by tinnitus;

Digitized by Google

on the other hand, a feeling of fulness in the corresponding part of the head; an inaptitude to intellectual work, &c., alternating sometimes with longer or shorter periods, during which the hearing recovers its first integrity, and the noises, as well as the other subjective phenomena, disdisappear, to come back suddenly with the return of deafness.

The facts gathered by Toynbee, Gruber, Schmalz, and others tend to establish for some cases a sort of connection between osseous excrescences of the external auditory meatus and an analagous affection seated in the tympanic cavity or in the vestibule. Toynbee speaks of three patients in whom the intensity of the tinnitus and the sensation of vertigo, of which they complained, proceeded very probably, according to him, from the pressure exercised on the expansion of the acoustic nerve by an exostosis situated in the vestibule; an hypothesis which, in the absence of the ulterior demonstration of the fact, ought, it appears to us, to be received with reserve.

But what is the use of invoking a cause altogether problematic when it suffices to explain the tinnitus by remembering the influence that the occlusion of the external meatus exercises upon the production of this phenomenon. Here the occlusion can proceed either from the exostosis itself, from an accumulation of cerumen, from epidermis detritus, from a liquid (mucous, pus, water) lying in the contracted space that the osseous excrescence has not yet filled up, or from the swelling of the soft tissues in that part. Now, if one succeed in such a case to re-establish, in a certain measure, the perviousness of the external auditory meatus, then the subjective aural phenomena almost always immediately disappear.

The only exceptions to this rule that we have met with concerned cases where there was a concomitant lesion of the middle ear. Thus, we believe that if cases of exostoses of the meatus be not oftener met with, it is expedient to seek the cause of this, not in the rarity of these tumours, but in the fact that they do not betray themselves by any symptom, unless they entirely occlude the lumen of the meatus, or be accompanied by an inflammatory disorder of the middle or external ear.

It would suffice, then, to multiply the examples of this affection by searching for them—and the result of our inquiry in the Hôpital St. Pierre proves this—that instead of waiting till chance brings them to our examinations, we should seek for them in the ears of individuals, who hearing well and not suffering at all, otherwise escape our notice.

So far as concerns the feeling of tension in the ear affected with exostosis and of heaviness in the corresponding part of the head, are these the result, as several specialists maintain (like Toynbee) of the pressure that the new osseous growth, imoeded in its enlargement, exercises on the walls of the meatus?

To this ingenious interpretation we oppose one much more simple, and of which Toynbee himself furnished the elements. It is to be remarked, indeed, that the observations v., vii., viii., and ix. of his "Treatise," the only ones where he makes mention of the aforesaid phenomenon, are the only ones also where the history of the disease evidently indicates the co-existence of an inflammatory process in the ear, by which one can, with quite as much reason, if not more, explain that symptom. It is to be remarked besides, in regard to the feeling of vertigo, that it is often observed in cases of simple occlusion of the meatus. The proof of this statement lies in the relative frequency of that phenomenon presenting itself alone, or associated with a feeling of fulness in the head, in persons who are attacked with ceruminal deafness.

(To be continued.)

H.R.H. THE PRINCE OF WALES, accompanied by H.R.H. the Princess, has graciously consented to lay the foundation stone of the new extension building of the Brompton Consumption Hospital to-morrow (Thursday).

Clinical Records.

HOSPITAL FOR EPILEPSY AND PARALYSIS, REGENT'S PARK, LONDON.

Under the care of Dr. ALTHAUS.

1. *Epilepsy and Consumption—Perversion of Moral Sense in the Epileptic—Therapeutical Value of Phosphorus and Digitalis.*

IN several cases of well-marked epilepsy now under treatment at this hospital, a family history of consumption has been obtained. Dr. Althaus has long been of opinion that next to the true neurotic constitution, the most powerful predisposing cause of nervous affections is a phthisical taint in the system.

There is now a boy, C. M., æt. 7, whose mother is the only one still alive of a large family, all the rest having died of consumption. As yet the boy's lungs are healthy; yet no other predisposing nor exciting cause of the epileptic fits has been discovered. These commenced when the boy was seven months old, and have since then continued without much intermission. He had two well-marked attacks on the day of his admission into the hospital, and two slighter ones within the next few days; having then been put under the influence of bromide of potassium, he has remained free for more than three weeks. A striking feature in this boy is that he is particularly unruly, disobedient, and mischievous. He has regular attacks of destructiveness in which he tears up his clothes, sheets and blankets, and anything he can lay hold of, using great force in doing so. After a particularly bad outbreak he was put into a strait-waistcoat, and managed to tear it to pieces with his teeth. At the visit he hides underneath the bed, and the nurse has great difficulty in extracting and producing him for inspection. Dr. Althaus has seen very good results of the exhibition of phosphorus dissolved in oil and given in perles, in this moral obliquity of epileptic patients. The mental condition of epileptics is always peculiar; they are not really insane, but often eccentric, suspicious, ill-tempered, perverse, fretful, and shy. In a considerable number of them bad instincts are rampant. Some time ago, Dr. Althaus had a girl, æt. 9, under his care, in whom the perversion of the moral sense was really a more prominent symptom than the actual epileptic seizures, which latter occurred only about once a month, and were not very severe. This girl was a fearful liar; she would on the spur of the moment invent the most outrageous and elaborate falsehoods, even where it would have suited her purpose far better to have spoken the truth. She stole money and other things wherever she had the opportunity, and endeavoured to divert suspicion to others. Her manner was sullen and defiant; her expression daring; and that this state of mind was closely connected with the epileptic condition, was shown by the circumstance that after attacks it appeared to culminate in almost desperate acts, getting out of the window at night, hiding in out of the way places, &c. After she had taken phosphorus for six months, she was wonderfuly improved. Her manners were pleasing; the facial expression calm, and she had become obedient and tractable.

In another epileptic, an Irishman, æt. 30, admitted October 3; there is a family history of consumption, but no actual lung disease as yet, although the patient is thin and ill-nourished. When ten years of age, he fell and struck the back of his head, but no ill effects were noticed at the time, and he was in good health until six years ago, when he became subject to nocturnal attacks of epilepsia gravior, with diurnal attacks of petit mal. There have been as many as nine attacks in the same night, but generally there is only one, which occurs soon after first going to sleep, or shortly before waking in the morning. He wakes up, feels that he is going to have a fit, and then immediately loses consciousness; he is seized by

Digitized by Google

strong general convulsions, bites his tongue, foams at the mouth, and passes the excretions. After the attack there is a stage of restlessness: he gets out of bed, walks about the ward, and keeps muttering unintelligible words, for about twenty minutes. All this time he is quite unconscious, takes no notice of anything, and does not answer questions when spoken to. Ultimately he goes back into bed and falls asleep; on waking he is calm and collected, but has a bad headache. Previous to admission he had been treated with large doses of bromide of potassium, which had caused deep ulceration of the skin of the face, destroyed the corium and hair follicles, caused the greater part of the beard to fall out, and left ugly and irritable scars. In spite of this medication the fits continued, so that the patient did not even receive compensation for the disagreeable collateral effects of the treatment. Dr. Althaus put him on full doses of zinc and henbane, with one evening dose of potassic bromide. The fits continued very much the same, there being between four and seven attacks of epilepsia gravior in the month, with extremely numerous seizures of petit mal. Ammonio-sulphate of copper and nitrate of silver likewise failed to exert any beneficial influence, and the patient was then put on tincture of digitalis with potassic bromide. After he had taken this for a fortnight, the fits left him. There has not been a single convulsive seizure for eleven weeks, while the attacks of petit mal have greatly diminished both in frequency and severity; and the patient seems in a fair way of recovery. His manners, which used to be excitable and occasionally impertinent, have likewise undergone a marked change for the better.

2. *Syphilis of both Sylvian Arteries—Double Hemiplegia and Aphasia.*

M. B., æt. 39, single, was admitted under the care of Dr. Althaus on April 22nd. He had lived much in the Tropics, and contracted gonorrhœa and syphilis in 1875. He was treated with mercurial inunction for four months, and was believed to be cured. Since then he had had several attacks of congestion of the liver, and cholera in 1877, while in India. In December 1878 he was much exposed to severe cold, and suffered for some days from headache and general uneasiness. One night, feeling very uncomfortable and being unable to sleep, he got out of bed and walked about, but found that he had difficulty in moving. On returning to his bed, he felt very giddy and speedily lost his consciousness. On waking in the morning he found that there was paralysis of the left side of the face and body, and that the excretions had passed into bed. He could not put out his tongue, the pupils were large, and the speech embarrassed. Five days afterwards he had an attack which proceeded much more slowly than the first, but ended in paralysing the right side and in totally abolishing language. He had constant pain in the head and giddiness. He was put on small doses of iodide of potassium, and in a month began to improve, recovering to some extent language and motive power.

On admission, he was found to be able to express himself slowly, but intelligently. He never substituted one word for another, but experienced great difficulty in articulation and the connection of sentences. The effort in speaking was so great that after a short conversation he was very much exhausted. The other mental faculties seemed to be in a fair condition; he was not at all silly, and appeared to remember things pretty well, but complained of the memory being much impaired. He suffered from what he called a "horrid giddiness," more especially on waking in the morning; and great pain in the head, which was rendered more acute by coughing, sneezing, &c. He sleeps very ill, and is restless at night. The face is covered with a cold clammy perspiration. The cerebral nerves are healthy, with the exception of some branches of the pneumogastric. There is great difficulty in swallowing; liquids are apt to return through the nose, and he cannot take solids at all. There is also habitual stertor, from a semi-paralytic condition of the soft palate. The extremities are in a state of incomplete paralysis; there is constant shaking of the body and limbs, which cannot be kept steady. He is unable to raise himself from the lying posture, and utterly helpless. The reflex action of the skin and tendons is increased, that of the mucous membranes normal. Spinal epilepsy is readily induced, more particularly in the right leg. The limbs are cold and flabby, but the electric test shows normal response of the nerves and muscles both to the voltaic and faradic current. Sensibility is normal throughout the body. Heart and lungs healthy, pulse feeble, 96, intermittent. Temperature normal. Appetite slight, action of bowels sluggish; urine, normal; excretions retained. Nocturnal emissions of semen occur somewhat frequently.

Dr. Althaus said that there were three great varieties of cerebral syphilis, viz.: 1st. The congestive form which affected the cineritious substance of the hemispheres, and presented the clinical features of general paralysis of the insane, symptoms of mental derangement appearing at an early stage. 2nd. Tumour, growing generally from the subarachnoid space, and causing nocturnal headache and epileptiform seizures. 3rd. Plugging of the arteries, more especially of the central ganglia, and causing necrobiotic softening of their structure. In the present case we had an instance of the last-named variety, there having been thrombosis, first of the right, and afterwards of the left, Sylvian arteries, which explained all the symptoms just noticed.

The patient was ordered—

℞ Hydrarg. perchlor., gr. 1-24th;
Potass. iodid., gr. x;
Tinct. uncis vomicæ, ℥xx. ter die in water.

The continuous current was ordered to be applied to the nerves and muscles of the extremities.

May 8th.—There is considerable improvement; the patient is able to raise the body from the lying to the sitting posture; the speech is easier, the skin of the face drier, and the limbs more movable. The perchloride was increased to gr. 1-16th, and potassic iodide to gr. xv. ter die.

May 22nd.—Patient has not been so well; he complains of "waves of unconsciousness" passing over him; head and face are again bathed in cold, clammy sweat; pulse 140; evening temperature 99·6; vertigo and restlessness, chiefly at night; general features of collapse. Ordered three glasses of port wine daily, and compound tincture of bark. Under this treatment the threatening symptoms gradually disappeared, and as the patient got stronger, iodide of potassium, which Dr. Althaus thought had caused the symptoms of collapse, was resumed and continued in ten-grain doses. The voltaic current was again regularly applied.

June 23rd.—He is now very much better in every respect; is able to get up from the couch and walk a few steps without assistance; speaks comfortably; hands more useful; stertor nearly gone; general condition satisfactory. Dr. Althaus expects great progressive improvement, but not a complete recovery, more especially with regard to the finer movements, such as writing, &c.

Special.

THE MEDICAL BILLS SELECT COMMITTEE.

On Friday, July 4, the Committee resumed their examinations.

Direct Representation.

Dr. Waters, of Chester, was the first examined, and spoke as an ex-President of the British Medical Association, and as representing the views of that body. He said there are about 23,000 names of practitioners on the Register, but many of them are in different parts of the world outside the United

Digitized by Google

Kingdom. The Irish Medical Association was formed with similar objects before the operations of the British Medical Association extended to Ireland. The proportion of Scotch and Irish members residing in Scotland and Ireland is very small compared with the English members. The Irish Medical Association works in harmony with the British Medical Association on the question of medical reform. We felt that if a Conjoint Board were established in England the strength of the Association in trying to enforce it in Scotland and Ireland would be greatly increased. We believe that a number of men of deficient attainments, both professionally and in general education, get into the profession through the facilities afforded by the existence of different examining boards. The chief opposition to the conjoint boards comes from Scotland. The officers of the Association see no reason why the universities should not co-operate with the corporations in Scotland, inasmuch as the universities are, equally with the licensing bodies, examining boards. We took the opinion of our constituents last year on the question whether the conjoint scheme should be compulsory or not. The result of the answers was 4,910 in favour of compulsion, and 264 against it. On the question of direct representation the answers were 5,075 in favour and only 121 against it. Our reasons for pressing direct representation is, that the members of the Medical Council are not fair representatives of the profession. The representative of a corporation will necessarily, as his first duty, take care of the individual interests of the corporation he represents. In the General Medical Council the representatives of the corporations meet as friends and form a pleasant party, and it is a very unpleasant thing to mar the harmony of their meetings by the introduction of subjects of a disagreeable character. The consequence has been an amount of mutual forbearance that has tended to keep back the education of the profession. Although they are now in favour of conjoint boards, I think it has been forced upon them by outside pressure and by the influence of the Government.

The CHAIRMAN.—That points to delay; but can you tell us of anything you think the Council ought to have done which it has refused to do, and which you think it would have done if there had been direct representation?

Dr. WATERS.—In the year 1868, when Dr. Parkes called attention to the lamentable ignorance which characterised the members of the medical profession who presented themselves for examination before the Army Medical Board, it fell like a bombshell upon the profession. Dr. Parkes was a Government nominee, not the representative of a corporation; but the Council could scarcely have been ignorant before of the fact that the profession was not creditably educated. The reports of the visitors at examinations revealed such ignorance on the part of candidates that it could not have been previously passed over if there had been representatives of the profession on the Council. I cannot see any reason for the Apothecaries' Society of Ireland having a member. I would let the Royal Colleges and the Universities each have a representative. No men know so well the defects of the system of education as those who have passed through it recently, and consequently their representatives would bring to the Council a knowledge of certain difficulties which exist in relation to education. I wish to see a greater number of professional doctors on the Council than at present. I think the speeches at the Council might be limited to a certain time. In my opinion very great good would be derived from a discussion on such subjects as medical jurisprudence in the Medical Council. I do not say that they should discuss such matters, but I believe no harm would result from such discussions. I do not see that either the English or the Irish Apothecaries' Societies exercise any beneficial influence either on education or for the public, and I do not think they are entitled to representation in the General Medical Council, when the great University of Edinburgh has only half a representative. I do not think the administrative power of the Medical Council is at present sufficient. I would give them greater power over the licensing bodies.

The Committee then adjourned.

The Medical Council and Direct Representation.

On Monday, July 7th, the Committee re-assembled and continued the examination of Dr. WATERS, who said, in reply to Mr. Maitland, that the Medical Council has interested itself on several occasions in general matters. It has considered the subjects of inquests, vaccination, and medical evidence, and latterly it has considered the interests of dentists and obstetricians, and has also taken up the question of vivisection. With regard to such subjects, I think direct representation would bring a great amount of knowledge to bear upon the deliberations of the Council in public, and still further in private, intercourse between the members. The consideration of such subjects would be more frequent than at present. When once this question of the conjoint scheme is settled, there remains comparatively little for the Council to do, except in regard to visitations and examinations, so that they will have time for the consideration of matters of public interest. The profession is unanimously in favour of improvement in medical education, but it has been resisted by some of the licensing bodies. Direct representation would bring greater pressure to bear upon those bodies. I admit there has been a certain improvement in medical education, but it is not *pari passu* with the improvement that has taken place in general education.

The Medical Journals.

In reply to Mr. MILLS as to the views of the principal medical journals, Dr. WATERS said the *Lancet* has stood up in perhaps a more unqualified manner than the Association Journal for the necessity of direct representation. The *British Medical Journal* is the journal of the Association, and it is impossible that it should advocate opinions opposed to any large section of the members without eliciting disapprobation. I cannot speak absolutely of the *Medical Times and Gazette*; its tone is rather uncertain. The *Medical Press and Circular* is decidedly in favour of direct representation.

Sir T. LAWRENCE.—Is there any country in which the representative system you advocate exists?

Dr. WATERS.—There is no other country where the representative system exists as it does in England. As to the United States, medical education there is in a most lamentable condition.

The Constitution and Work of the Medical Council.

Dr. GLOVER, of Highbury, who is on the staff of the *Lancet*, was the next witness examined, who said, I have had more opportunities, perhaps, than most people, not members, of seeing the working of the Medical Council. I have the highest respect for the members of the Council, but I object to the constitution of that body, especially the predominance of corporate interests. I regret that the Scotch universities are using all their power in opposition to the present demand for a Conjoint Board. I think the history both of the examining boards and of the Council shows that corporation influence is injurious. I have the strongest practical objection to the constitution of the Council. In its great work of education it has failed, I do not say altogether, but seriously, especially when we remember the eminence of its members, the large sum of money it has received, and the length of time it has had to do the work which it has not done. It has decidedly done some good, but far less than it might have done at a less cost of time and money. My great complaint is, that while the Council has greatly added to the stringency and severity of the examinations, it has not made any corresponding improvements in medical education.

Removal of Representatives of Certain Bodies.

In reply to the Chairman, Dr. GLOVER said, I would dispense with at least one representative in each division of the kingdom. I should say that the Irish Apothecaries' Society can be dispensed with. Then the English Apothecaries' Society, though it has done good work, is certainly no longer needed; and I think one of the Scotch corporations might be dispensed with. I do not like to say which body, but perhaps the Faculty of Physicians and Surgeons of Glasgow, so leaving two Royal colleges. Until the Act of 1858, the English Apothecaries' Society gave the only qualification in medicine for English practitioners. It cannot examine in surgery.

The CHAIRMAN.—Do you think there is any truth in the allegation that the members of the Medical Council do not understand the wants of the general practitioner?

Dr. GLOVER.—I do think there is a great deal of truth in that. They are men of eminent abilities, and most of them originally of good social position; many of them have had a Continental education and greater advantages than fall to the lot of most people, and under these circumstances I do not think that they are likely to understand the difficulties of men who have to be content with the ordinary education of the schools. I remember being very much struck with a state-

Digitized by Google

ment by Dr. Stokes in the Council, that he had never been in the chamber of a lying-in woman.

EXAMINATIONS FOR THE ARMY AND NAVY.

In reply to Mr. Maitland, Dr. GLOVER said the special army and navy medical examinations might, perhaps, be abolished if the authorities were satisfied with the present examining boards. There would, however, be some specialties of knowledge in regard to the army and navy which might require to be tested, but certainly a man who is entitled to practise on her Majesty's subjects generally should be entitled to a Poor-law appointment.

THE TITLE OF "DOCTOR" AND MEDICAL STUDENTS.

In reply to Mr. Wheelhouse, Dr. GLOVER said the license of the College of Physicians, Edinburgh, is often supposed, but falsely, to confer the right to use the title of "Doctor," and that is a strong inducement to students to go to that college. The licentiate of the College of Physicians, Edinburgh, has no legal right to the title of Doctor. If he assumes it, that is not the act of the College itself unless the College in some way encourages the notion that he is entitled to it. I have no doubt, with the present loose regulations, it is possible for unprincipled students to get on the Register without having attended lectures. I think the interests of students have been too little regarded. Some of the intelligent senior students might be able to give information to the Committee as to the difficulties in their way.

The Committee then adjourned.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 16, 1879.

WORKHOUSE HOSPITALS.

DR. THOMAS M. DOLAN, of Halifax, has done well in drawing the attention of the profession to the great need of reform in the constitution and management of our unions and workhouses. In a pamphlet on "Workhouse Hospitals, with Illustrative Cases" which he has just published, and which is a reprint of a paper read by him at the Leeds and West Riding Medico-Chirurgical Society, Dr. Dolan clearly and forcibly points out the reforms which should, in his opinion, be instituted, and the grievances which should be removed before our workhouse hospitals can be put on such a footing as the public, and even the patients themselves, have a right to expect. Some of the questions to which Dr. Dolan draws attention are of special interest, both from a medical and public point of view, and the following remarks must be regarded as chiefly a *resumé* of the more important facts contained in his pamphlet on the subject.

In the first place, as Dr. Dolan justly observes, the name "workhouse" is a misnomer. In the majority of towns the so-called workhouses are large hospitals, supplementing the subscription general hospital. In many towns they supply the major part of the hospital accommodation. Opert lays down the rule that a town of 50,000 inhabitants need not have a hospital for more than 150 patients, provided there is a union infirmary with 50 beds. But, as a rule, the inverse ratio exists. Thus, while the Halifax Infirmary has accommodation for only 70 patients, the Union Infirmary can accommodate 240. As, moreover, the voluntary infirmary is chiefly devoted to surgical cases, there cannot be accommodation for the average proportion of medical cases in a town like Halifax, of more than 50,000 inhabitants. But a still greater anomaly is the fact that, while the Infirmary is well and ably officered, the Union has only one medical officer attached to it. The former is provided with a good medical and surgical staff, consisting of a house-surgeon, an assistant house-surgeon, two consulting physicians, four visiting surgeons, and two visiting physicians.. Hence the patient who accepts aid from the voluntary infirmary has the advantage of select advice from many sources, whilst another poor man, unable to be admitted to that infirmary for want of room, must go to the Union, where there is only one medical officer. It can easily be imagined that, under such a system, the nursing arrangements are no better. At the Halifax Infirmary there is one nurse to nearly every twelve patients, while at the Union Infirmary there is only one nurse to over one hundred—and this, too, at a time when the education of nurses for the sick poor is attracting unusual attention.

Dr. Dolan would also have for certain poorhouse infirmaries, a resident superintendent medical officer, free and unfettered medical attendance, medical officers who shall not be required to find medicines, and who shall have full control over the management, nursing, &c., subject, of course, to visiting committees. There can be no doubt that the appointment of a medical superintendent to all our large workhouses would be a step in the right direction. The supervision of other large charities, and of even large private institutions, has proved a great success. "Our public asylums have," observes Dr. Dolan, "reached their present high state of efficiency owing to the fact of their medical officers being placed under the most favourable conditions as regards management and control." Certainly the inmates of these asylums are paupers, but the pauper in the workhouse to-day may be in the asylum to-morrow. The identity of the interests involved in both classes of

Digitized by Google

patients is the same. "It is not unreasonable to expect, then, that medical officers of workhouses should be equally intelligent, equally fit to be trusted with administrative powers." Then, again, that medical officers should have, as they do, to supply the pauper patients with medicines, is not only a great mistake, but an act of injustice to the patients themselves, who have as much right to the best medicines and the most scientific appliances as the general hospital patient has. But if the medical officer has to provide the drugs himself, motives of economy may induce him to give the patient less medicine than his case requires, thereby prejudicing his chances of recovery. Besides, if the public be taxed by the illness of a patient, then the truest economy is to restore that patient to health as soon as possible, for negligence will convert a temporary illness into a chronic one, with a corresponding lengthy drain on the local relief list.

The prohibition of post-mortem examinations in workhouses is an old-standing ground of complaint against the Local Government Board; and it is to be hoped that such an absurd and illegal regulation will soon be withdrawn. There is a duty that belongs to the poor as well as to the rich. If the latter do all in their power to succour the poor in sickness or distress, it is the duty of the poor to give some little return for the benefits bestowed upon them. It is very wrong of them to throw obstacles in the way of a practice pursued in the interest of science and the public good, especially when the objections they raise consist in nothing more than sheer prejudice, and a sort of sentimental affectation. It is this prejudice which is at the bottom of the course taken by the Local Government Board, and until that is removed, we may find it difficult to make the Board alter its decisions on the subject. In France there is no such restriction placed on the making of post-mortem examinations, and it shows great want of moral courage in our local authorities on the one hand, and of common sense and gratitude as regards the poor on the other, that we in this country should be deprived of such a privilege.

There is one fact pointed out by Dr. Dolan which undoubtedly gives the inmates of the workhouse a great claim upon our sympathy and attention. We are apt to forget that these institutions are filled with a different class from the one they were meant for. The patients are not composed of the improvident, the dissolute, the extravagant, or the vicious. The majority are the victims of circumstances, deserving poor, whom illness alone has led on the downward path to pauperism. The pensionless soldier with aortic aneurism, the would-be thrifty mechanic with phthisis, the baker bronchitic from the result of his employment, the out-door labourer with rheumatism or pneumonia; these are the class of people who take refuge in the workhouse infirmary, and who, therefore, are entitled to as much consideration as is bestowed upon the inmates of our large general hospitals. In conclusion, therefore, we say with Dr. Dolan that the truest economy of poor-law medical relief consists in placing the poor-law medical officer in the full possession of every power enjoyed by his *confrères* who are attached to voluntary hospitals, in assimilating the management of workhouse infirmaries to the general principles of hospitalism, and, in a word, in contributing all those essentials which are deemed necessary in all well-organised voluntary institutions.

THE SANITARY STATE OF DUBLIN.

THE most recent weekly return of the death-rate of the city of Dublin shows the mortality as 26·3 per 1,000 of its population, that for London, Glasgow, and Edinburgh being respectively 17·4, 19·1, and 18·2. This is, however, an exceptionally favourable death ratio, for we find that, last week, the rate was 36·7 per 1,000, and the death-rate for the entire quarter, ending June 28, was 36·4 against a ten-years average of the same quarter, amounting to 26·4. On the three months, therefore, the mortality has increased nearly one-third. The total deaths for the past six months were 6,508, those for the same six months of 10 years, 4,511.

The terrible fact is, that in these six months, without any epidemic of a serious character, and in the spring season, *nearly two thousand lives have been sacrificed in Dublin* (1,997), *over and above those usually given to disease in Dublin, and nearly* 3,000 *over and above the number which would have been lost if the city were no more unhealthy than other large cities.*

We repeat the statement, that the disgraceful neglect of sanitary organisation in Dublin has cost the citizens 2,000 lives and enormous money loss within the short period of six months, and, however the statement may grate upon the feelings of shopkeepers, hotel proprietors, and their journalistic representatives in Dublin, we challenge denial of it, and defy apology for its causes. The attitude of certain of our Dublin contemporaries upon this subject is to us incomprehensible. The *Freeman's Journal*, which represents the Public Health Committee, admits the figures, but seeks to conceal their terrible meaning by sophistries which are too obvious to need reply.

Here is a description, culled from its own columns, of a locality which has flourished for years under the *regimé* of the Corporation Sanitary organisation: since we wrote as to the state of Plunkett Street, we have been to the place again, and made a careful inspection of it. If anything, our description of it failed in conveying an adequate idea of the filthy and revolting spot. It is a plague-nest of the vilest character, and a reeking sink of moral and material corruption. It is at the very door of the parochial schools, and cannot be but a source of moral infection and contamination to the children who frequent them. We know of nothing in our city comparable to it. As it is at present, Plunkett Street is a drain upon the city resources, for, if we are not misinformed, the cost upon the rates for the burial of dead children from the street is something enormous."

The *Irish Times*, on the other hand, says: "Comparing the death returns for the quarter ending June 28th, with that for the quarter ending March 29th, it is found that the mortality rate for the former is 35·1 per 1,000, as against 41·6 in the latter, and an average annual mortality for the second quarter in the ten years 1869-78 of 26·4." And then, paradoxically, the editor proceeds as follows: "It is not now our purpose to enter into any investigation as to the causes of the high death-rate in Dublin. It is

Digitized by Google

evident that it has recently been greatly influenced by unfavourable climatic conditions. The question is a large one, and the time is *not opportune for its discussion.*"

"Why," we ask, "not opportune for discussion?" Is there any subject so worthy of the columns of a Dublin paper as the sacrifice of 2,000 lives in six months within its own circle of jurisdiction? Is there any grievance more clamorous than the continuance of a sanitary system which tolerates and defends such a condition of things? Is there any duty more pressing upon a public journal than to demand investigation of such a state of affairs, and denounce the negligence and laziness which permits such a mortality to continue unchecked? We think not; and so far as in us lies, we protest against the lives and health of the citizens being sacrificed either to a regard for the Public Health Committee, or a fear for the profits of shopkeepers.

Notes on Current Topics.

The Actual Cautery in Medicine.

Among the many remedies for disease which, comparatively speaking, have now but historical interest, we may mention the actual cautery. The reader will not want reminding of the frequency with which this agent used to be employed by the ancients. Aretæus applied it to the head in epilepsy and obstinate cephalalgia, and recommended it for the opening of hepatic abscesses. Celsus also orders it to be used in the treatment of epilepsy, dropsy, and other affections. Few, perhaps, would, even in these days of chloroform, be inclined to go the length of the Greek physician, perforate the cranial bones as far as the diploe, "and then use cerates and cataplasms till the meninges separate from the bone." But, perhaps, we moderns have done wrong in allowing the use of the actual cautery to become an almost obsolete method of treatment. Dr. E. C. Segius is evidently of this opinion, for in the *Archives of Medicine*, for last April, he has made some very suggestive observations on this subject, which have likewise attracted the attention of the *Medical Record*. In choosing, he says, a cautery, it is always advisable to select one with a platinum tip, since the metal will not become rough from long usage. The Paquelin benzine cautery is the most serviceable one hitherto invented, the only objection being its great cost. The Brown-Séquard cautery (which merely consists of an olive-pointed steel cautery-iron about 30 ctms. long, the olive being about 15 mm. in diameter at the base, and carefully covered with platinum), will, however, answer all practical purposes. This may be heated to a white heat in a grate-fire.

The method of application usually adopted is that called "cautérisation transcurrente" by Jobert and Notta, which consists in making very light parallel strokes with the cautery at white-heat over the part chosen as the seat of counter-irritation. From four to twelve strokes can be made in a very short space of time, and with very little suffering; only the cuticle should be affected in order to avoid subsequent suppuration. The only dressing required is the application of a piece of linen. It is often desirable to repeat the cauterisation frequently. In spinal affections we may begin at the top and cauterise the entire spinal region systematically and repeatedly by means of daily or tri-weekly applications. The majority of patients consider the pain very slight. Superficial cauterisation with the actual platinum cautery has been satisfactorily used in:—1. Neuralgia, acute and chronic, of the trigemina and of the peripheral nerve. 2. Spinal irritation and various cerebral paræsthesiæ. 3. Spinal congestion. 4. Various forms of acute and chronic myelitis. 5. Epilepsy (not by myself). 6. Intercostal pain. 7. Acute and chronic lumbago. 8. Articular inflammation. 9. Peri-arthritis (chronic rheumatism?) especially of the shoulder.

Another "Serious Charge" against a Surgeon.

We were much pained to see the above announcement in the daily papers of Monday last, which, upon reading, we found was a charge of "feloniously and unlawfully using certain instruments, with intent to produce miscarriage, thereby endangering the life of Ellen Saunders, against Dr. Francis James Hammond, F.R.C.S., L.S.A." According to the evidence, the defendant, having quarrelled with his wife, had lived for a time with the said Ellen Saunders, but he emphatically denied having attempted abortion. The preliminary examination was held before Sir James Ingham, at Bow Street, bail being refused until more substantial and definite information could be adduced. In the meantime the matter is to be placed in the hands of the Treasury solicitors, and the defendant remains in prison. We do not, of course, intend to comment upon the painful nature of the case whilst *sub judice*, but this we may say—that we have searched both the official Register and the "Medical Directory" of the present year, and are unable to find the name of "Dr. Francis James Hammond, F.R.C.S., L.S.A.," as described by the daily papers, and hope it will turn out that he is not in any way connected with the medical profession.

Chinese Materia Medica.

Among the Pharmaceutical products exhibited at the Paris Exhibition in the Chinese section were the following: Bear's gall—a sovereign antidote: Bezoar stones—an infallible panacea: skins of the python—for paralysis and rhenmatism; dried fowls' gizzards—as a substitute for pepsine; inner pellicle of eggs—for jaundice; human urinary calculi—for renal complaints; hippocampus (seahorse)—for women in confinement, the woman to hold one in her hand; powdered elephant's skin—rheumatic complaints; fossil bones—for chorea and fever; ashes of roasted grass-hoppers—for headache; tincture of scorpions—stimulant; decoction of small green serpents—for skin diseases; tiger's bones in jelly—a costly medicine, said to possess high tonic virtues; inside of a stag's horn—colds and bronchitis; buck's sinews—for rheumatism and sciatica; glue made from asses' skins—enjoys a great reputation as a remedy in lung diseases; the dried excrement of silkworms—for eye diseases; dried earthworms—for secret diseases; toad's mucus—this is prepared by keeping live toads in a vessel half-filled with flour; when the flour is sufficiently impregnated with the slimy excretions of the toads it is separated and dried—this remedy is used in convulsions.

Propylamine in Acute Rheumatism.

THIS alkaloid (trimethylamine $C^3 H^9 N$) has long been employed on the Continent for every form of rheumatism, but has been little used either by English or American practitioners. Dr. Gaston, in the *Indiana Journal of Medicine*, jots it as a prompt and efficient remedy in all uncomplicated cases, "subduing the pain in from 24 to 48 hours." Moreover, Dr. James L. Tyson states (in the *Philadelphia Medical Times*) that more extended observation will, in his opinion, fully justify the merits ascribed to it; he would commend it to the earnest consideration of those whose prejudices exclude salicin and its compounds from their materia armentaria. He also protests against the expectant treatment of acute rheumatism, and says that he has succeeded over and over again in "breaking up" an acute attack of this affection, in periods varying from five to ten days, without a vestige of pain or swelling being left, or a trace of heart complication, by the employment of salicylate of sodium, or vinous tincture of colchicum. Where, however, either from the idiosyncracy of the patient or other causes, these agents cannot be used, Dr. Tyson recomends propylamine. The formula he uses is: — Propylaminæ chloridi, gr. xxiv.; aq. menth. piperitæ, aquæ, ää f. ʒiij. A tablespoonful to be taken every two or three hours. The dose of propylamine is six drops, similarly prepared and administered. By giving two grains of the chloride, as above, and swathing the joints in cotton wool, benefit was apparent in the first 24 hours.

Aneurism of the Ascending Aorta Successfully Treated by Electrolysis.

AT a recent meeting of the Paris Académie de Medicine, M. Bucquoz presented a patient, laundress, æt. 39, with an aneurismal tumour occupying the external portions of the 2nd, 3rd, and 4th right intercostal spaces, measuring twelve centimetres in length and bulging out from the thoracic walls about eight centimètres. June 12, 1878, two needles were inserted into the tumour a depth of two centimètres and a half, and then connected with the positive pole of a galvanic battery. The pain was severe during the operation but gradually passed off. The tumour gradually diminished in volume, and after four other applications, at intervals of fifteen days, it was reduced to one-half its former size. She was discharged on the 23rd of August, but returned two months later. On October 31, November 16, December 11, and January 4, the electro-puncture was repeated. As presented to the Academy there was no protuberance, except a small lump about the size of a hazel-nut, which moved with the cardiac impulse, and gave a slight aneurismal bruit. This remaining tumour was much hardened since the last operation, and Dr. B. thought that it would eventually become completely solidified.

The Health of London.

IF this unseasonable weather has been unfavourable to the crops and bad for trade, it does not appear to have been productive of disease. Indeed, it has generally been found that a moderately low temperature with a large amount of rain-fall is attended with a large diminution in some of the maladies to which human flesh is heir. The Registrar-General's weekly return states that in London 2,319 births and 1,208 deaths were registered last week. Allowing for increase of population, the births were 19 and the deaths so many as 206 below the average numbers in the corresponding week of the last ten years. The annual death-rate from all causes, which had been equal to 19·5, 19·0, and 18·3 per 1,000 in the three preceding weeks, further declined last week to 17·4, the lowest rate that has prevailed in London since the middle of September, 1877. The 1,208 deaths included 11 from small-pox, 79 from measles, 38 from scarlet fever, 11 from diphtheria, 35 from whooping-cough, 11 from different forms of fever, and 13 from diarrhœa; thus to the seven principal diseases of the zymotic class, 198 deaths were referred, against 218 and 225 in the two preceding weeks. The deaths referred to diseases of the respiratory organs, which had been 264, 206, and 175 in the three previous weeks, rose again to 197 last week, and exceeded the corrected weekly average by 29; 122 resulted from bronchitis and 59 from pneumonia. The duration of registered bright sunshine in the week was 46·8 hours, the sun being above the horizon during 115·2 hours; the recorded duration of sunshine was, therefore, equal to 41 per cent. of its possible duration.

The Irish Apothecaries Company.

OUR readers already know that Dr. J. W. Moore refused recently to continue to act as Arts Examiner of the Dublin Apothecaries' Hall, because the governors of that institution thought fit to take him to task for his connection with the Irish Medical Association, which body had expressed a decided opinion that the fifteen partners in the drug establishment, known as the Apothecaries' Hall of Ireland, had no claim to be represented in the General Medical Council. As a corollary to the proceedings of the governors with reference to Dr. Moore, we publish the following note addressed by Dr. Wyse to the Association.

SIR,—I perceive by a "Document" issued from the Council of the Irish Medical Association on 21st ult., that efforts are being made thereby to disfranchise the Apothecaries' Hall, and deprive its Licentiates of their time-honoured legal rights as "General Medical Practitioners," to which class I have the honour to belong.

I have hitherto looked upon the Irish Medical Association as a safeguard of *every* established professional interest in this part of the United Kingdom; but the statements set forth in that "Document" relative to the Apothecaries' Hall of Ireland, derogatory as they are to the proceedings of the General Medical Council, and disparaging to the status of my fellow Licentiates, merely serve as an echo of former attempts to defame our "Alma Mater," which has been, well nigh to a century, true to the honour of the profession at large, and stands out as a model upon which the Medical Act was founded twenty years ago. Please erase my name off your list of subscribers, and much oblige

Your obedient servant,

GEO. WYSE.

To the Honorary Secretary of the Irish Medical Association.

June 12, 1879.

We could not be guilty of defaming Dr. Wyse's "'Alma Mater,' *which has been, well nigh to a century, true to the honour of the profession at large, and stands out as a model upon which the Medical Act was founded twenty*

Digitized by Google

years ago," but we are obliged to confess our sympathy with the opinion that, inasmuch as there is not a shadow of a pretence for supposing that the Licentiate Apothecaries of Ireland have any representation in the General Medical Council, we do not see the justice of continuing a vote in that assembly to the representative of an institution which, without the smallest legal right to do so, gives a very limited number of licenses at ten shillings and sixpence each to practitioners in pharmacy or in medicine, whichever they may be.

Hospital Saturday Fund in Birmingham.

BIRMINGHAM, to which belongs the honour of initiating the Hospital Fund movement contributed £3,421 to the recent Saturday collection in manufactories and workshops in addition to the Sunday Fund in places of worship. Last week the Committee of Distribution decided their awards, by adhering to the old plan of dividing the money according to the work done for the poor by each institution. The following sums were then handed over:—To the General Hospital, £1,083 3s. 1d.; Queen's Hospital, £597 13s. 2d.; General Dispensary, £386 5s. 8d.; Children's Hospital, £303 1s.; Eye Hospital, £178 18s. 4d.; Birmingham and Midland Counties Sanatorium, £132 0s. 8d.; Homœopathic Hospital, £109 15s.; Women's Hospital, £95 15s. 2d.; Lying-in Charity, £42 17s. 7d.; Orthopædic Hospital, £52 2s. 10d.; Ear and Throat Hospital £15 0s. 6d.; Dental Dispensary £3 7s.

Animal Vaccination.

A BILL has been brought in by Dr. Cameron, Earl Percy, Dr. Lyon Playfair, and Dr. Lush, with the object of procuring the vaccine lymph direct from calves. Under its provisions it will be compulsory on any public vaccinator, whenever the parents of a child shall demand to have it vaccinated with animal lymph, to have it so inoculated, and in case the demand be not complied with no prosecution shall lie against the parents for refusing to have the operation performed otherwise. The cost of the lymph shall be defrayed by Parliament. The proposed Act, it should be stated, extends its provisions to the whole of the United Kingdom. It will be in recollection that the guardians of a Galway Union, acting on the advice of their medical officer, resolved, some months ago, to try animal vaccination, and to purchase a calf for that purpose; but the Local Government Board put a veto on that resolution, and declared that the use of vaccine lymph was contrary to the existing law.

The New Northern University.

A CONFERENCE was held at Owens College, Manchester, last week, between a Committee of the Council of that institution and representatives of the Council of the Yorkshire College of Science, Leeds, with the object of preparing a draft constitution for the new Northern University, the charter for which was recently granted by the Crown. Considerable progress was made in the draft, which, after confirmation by the Councils of the respective institutions, will be presented to the law officers of the Crown of their consideration, with a view to its adoption as the basis of the new University.

Society for the Relief of Widows and Orphans of Medical Men.

THE Quarterly Court of the Society was held on Wednesday, July 9th at 8 o'clock, Sir George Burrows, Bart., M.D., President, in the chair. Sixty widows and orphans were receiving grants amounting to £1,296. Three orphans on the Copeland Fund were voted £6 each. The expenses of the quarter amounted to £47 17s. 0d.

Two additional widows and orphans were admitted as recipients of grants. The death of one widow and the marriage of another were reported. Two new members were elected, and two deaths of members were announced.

A memorial was read from the Midland Branch of the British Medical Association asking the directors to extend the benefits of the Society so as to embrace the Midland Counties. The directors resolved that—"The Court of Directors regret that at present they do not see the possibility of extending the operations of the Society in the mode suggested by the Midland Branch of the British Medical Association. The Court will, however, be happy to receive any definite propositions from the Midland Branch, which will tend to make their application more feasible." At the suggestion of the President it was resolved that the hour of future meeting should be changed from eight o'clock to five.

Sanitation in Gray's Inn.

THE sanitary officer for the Holborn District will do well to turn his attention to Gray's Inn, if the frequent rumours heard concerning that place be true. The arrangements which were sufficient to satisfy the demands of our grandfathers and great-grandfathers, are, as a rule, deemed deficient nowadays from a sanitary point of view. Hence it becomes an important question to decide whether such places as the Inns of Court do not tend to encourage the growth and spread of epidemic disease. In Gray's Inn, for instance, only a minority of the residents possess a direct and constant water supply, and the sources of the fluid supplied to the others is more than doubtful. In South Square one of the common taps is situate immediately over a sink down which there is daily poured waste water of a highly dangerous character. The surroundings, too, of certain portions of the Inn require sweeping changes ere the health of those occupying chambers amid them can be reckoned in any way safe. In one instance the bedroom of a series of sets of chambers look directly on to some eight or nine privies in constant use by the visitors to a common lodging house. Can it be wondered that epidemic disease should find its way about a locality thus favoured? We draw attention to this subject because we feel it is an important one, affecting a large body of people, and because we think the craze for hygienic reform, now that it is in full cry, might be advantageously directed in certain quarters, such as those we have drawn attention to.

The Sanitary Institute of Great Britain.

THE Duke of Northumberland presided at the anniversary meeting on Thursday last, and distributed the prize medals and certificates of merit awarded to the successful exhibitors at the Stafford Exhibition. The meeting was

Digitized by Google

held in the theatre of the Royal Institution, and was well attended. The recipients of the prize medals were Messrs. Pocock Brothers, Southwark Bridge Road; Messrs. Billing and Co., Hatton Garden; Messrs. S. Leoni and Co., Strand; the Silicate Paint Company; Messrs. Doulton and Co., Lambeth: Moule's Patent Earth Closet Company; Major F. Duncan, Woolwich Common; the Sanitary Appliance Company; G. E. Pritchett, Fish Street Hill; and Messrs. Hassell and Singleton, Phœnix Foundry, Birmingham. The Silicate Paint Company were also awarded the Richardsonian Gold Medal for a non-poisonous substance for white lead. In presenting this special medal the noble Duke expressed his belief that this was the greatest invention ever hit upon, as it prevented the dreadful suffering caused by the use of lead paints. The Duke of Northumberland, in response to a vote of thanks for presiding, expressed the pleasure the satisfactory progress of the Institute had afforded him. The annual dinner of the Institute was given the following evening at the Grosvenor Restaurant, when Dr. Richardson presided.

Royal Hospital for Incurables.

A HOSPITAL full of incurable patients is not, in many respects, a very pleasing sight to most medical men. It is not calculated to flatter, or to increase, in a professional point of view, our self esteem. The reflections, however, to which such a scene may give rise need not be altogether of an unprofitable nature. As medical knowledge increases and sanitation becomes more generally diffused, we may expect through either preventive or curative measures, to see the number of incurable diseases greatly diminished. Without, therefore, any desponding feelings we congratulate the governors of the hospital at Putney Heath, upon the success with which the ceremony of laying the stone of a new wing passed off. Their Royal Highnesses the Prince and the Princess of Wales took the principal part on this occasion. The Prince made an appropriate speech, and afterwards went, with the Princess, over several of the wards. After the departure of the Prince and Princess, a collation was served, under the chairmanship of Mr. Allcroft, to 400 or 500 persons; and it was announced that the subscriptions, including an estimated sum of £1,000, as contained in the purses—this, being doubtless, below the mark—amounted to £9,400 and upwards.

Unregistered Medical Men.

IT is to be hoped that the fine of £10 with costs, which has just been inflicted upon a medical man for falsely assuming the title of a registered practitioner, will be a warning to those who may feel inclined to follow this gentleman's example. It appears that, although only holding a German diploma, he gave a certificate of the unsuccessful vaccination of a child bearing his signature, and the words "medical practitioner duly registered." The defence set up was, as is usual in these cases, a very lame one, and the judge was quite right in saying, that according to the present law the defendant was not properly qualified. Such cases as these show the necessity of having a Conjoint Board, without passing which, no practitioner can be legally qualified to practice medicine. While there are so many portals through which a man may enter the profession, it is difficult for the public to know who are, and who are not, properly qualified.

Alcohol in Hospitals.

AT the annual meeting of the Swansea General Hospital, held on July 9th, after the adoption of the reports and usual resolutions, Mr. W. C. Amery said he wished to call the attention of the meeting to the question of the expenditure for stimulants in this hospital, and more particularly to a point which had probably not been noticed by the committee, viz., that the cost of stimulants had been gradually increasing for the last five years. In 1874 the expenditure for spirits, wine, and ale was £82 6s. 8d.; in 1875, £92 8s.; in 1876, £95 15s. 5d., or an average for the three years of £90 3s. 4d. The average number of patients was 384, showing 4s. 8¼d. per case. In 1877 the figures were £111 15s. 1d.; in 1878, £105 3s. 7d.; average expenditure, £108 9s. 4d.; patients, 358—or 6s. 0½d. per case. From the experience of this hospital it had been shown that was it possible to do with less stimulants than were used, and it would be well at least to go back to the old amount. Many hospitals throughout the country did without stimulants altogether, or used a very small proportion. The cost of Swansea Hospital, with an average number of 50 patients, was last year £2 2s. 1d. per head. There were many provincial hospitals where no stimulants were used, and in London there were at least three where no alcoholic compounds were administered. He therefore moved, "That the attention of the meeting be called to the increased expenditure upon spirits, wine, and ale, with a view to inviting the co-operation of the medical officers in reducing the same to the lowest possible amount consistent with the objects of the institution."—The Secretary said Mr. Amery was under a misconception. During the past year the number of patients had increased, and the expenditure for stimulants had decreased.—Dr. Paddon, speaking as the senior physician present, and as one who had been long connected with the hospital, said he had always ordered, and would continue to order, what he believed in his conscience to be best for the patients he attended. When he did order alcohol it was generally in the very mild form of claret. He believed that for people coming into hospital in poor and bloodless condition, something more than milk was required, and he should be doing less than his duty if under these circumstances he did not order it.—Mr. Amery then agreed to withdraw his resolution, being satisfied with having drawn the committee's attention to the subject.

Hydrophobia in the Co. Dublin.

MR. BETAGH, J.P., Clonsilla, co. Dublin, master of a pack of harriers, having read our report of the cases of hydrophobia in Lancashire, has called at our office and informed us that he lost four of his favourite hounds last May from hydrophobia. The first, a bitch, showed symptoms of the disease on the 29th April, and when he was isolating her from the rest of the pack she sprang on him and bit him severely on the hand. He immediately sucked and cauterised the wound, which was afterwards dressed by Dr. Duckett, since when he has suffered no incon-

Digitized by Google

venience. In order to watch the case he had the bitch isolated, and she died in four days, during which period she had shown all the symptoms of hydrophobia.

Catholic University School of Medicine.

At a meeting of the Medical Faculty on Thursday, Professor Campbell was elected to the office of registrar, resigned by Mr. Hayes, to whom a cordial vote of thanks was passed for the unvarying courtesy and efficiency with which during a very lengthened period he discharged the duties of that onerous position.

The rates of mortality per 1,000 last week in the principal large towns of the United Kingdom were exceptionally low, being only in Portsmouth 10, Leicester 14, Hull 14, Nottingham 15, Brighton 15, Wolverhampton 15, Bristol 16, Leeds 17, London 17, Sheffield 17, Salford 18, Birmingham 18, Edinburgh 18, Glasgow 19, Sunderland 19, Oldham 19, Plymouth 20, Bradford 20, Liverpool 21, Norwich 22, Manchester 22, Dublin 26 (including 27 deaths prior to June 1st), and the highest rate 27 in Newcastle-upon-Tyne.

The low death-rate of London, 17 per 1,000, compares very favourably with the following foreign cities; the last weekly returns gave, in Calcutta 32, Bombay 35, Madras 31; Paris 23; Geneva 19; Brussels 25; Amsterdam 21, Rotterdam 29; The Hague 20; Copenhagen 22; Christiania 17; St. Petersburgh 38; Berlin 31, Hamburg 30, Dresden 24, Breslau 33, Munich 36, Buda-Pesth 38; Rome 24, Naples 29, Turin 24, Alexandria 41; and New York 21 per 1,000. Small-pox caused 28, and typhus and typhoid fevers 40 deaths in St. Petersburgh.

The Paris *Globe* publishes the following telegram from Odessa:—"The transport ship which left this port recently for Saghalin with a convoy of seven hundred Nihilists lost two hundred of them on the way from disease, occasioned by overloading and the absence of all sanitary precautions. One hundred and fifty others were also landed in an almost dying state. A second transport is being prepared under the same horrible conditions. The prisoners are packed like cattle in the hold of the ship."

The panic in Memphis is slightly subsiding, in consequence of a report issued by the medical authorities stating that the new cases were not yellow fever. The exodus of the inhabitants, however, continues, and the municipal authorities at New Orleans and Vicksburg have proclaimed a strict quarantine to be undergone by persons arriving in those towns from Memphis. The heat in the Southern States of America is excessive, and many deaths are occurring from sunstroke.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Health of Edinburgh.—The deaths last week fell from 77 to 71, after deducting 8 country cases in the hospitals. The rate of mortality was 17 per 1,000. But one death from fever was recorded, and that occurred in the New Town. The zymotic mortality was otherwise low.

The New Edinburgh Medical School.—In anticipation of the early acceptance of contracts for the northern division or Materia Medica and Medical Jurisprudence Departments of the New Medical School, operations have been commenced, with a view to the demolition of the extensive block of two-storey-dwelling houses on the south side of Teviot Place.

New Royal Infirmary, Edinburgh.—In connection with the furnishing of the New Royal Infirmary, Edinburgh, a movement has been set on foot to furnish one ward by medical men. The original intention of confining the subscriptions to Edinburgh has now been departed from, and, doubtless, many graduates of the Edinburgh University throughout the kingdom, and elsewhere, will gladly avail themselves of the opportunity thus afforded of aiding the New Infirmary. There is an influential committee of management, and the scheme has been cordially supported by the leading medical men in Edinburgh. Subscriptions are fixed at £2 2s., and it is requested that they be sent as soon as possible to the Treasurers, Dr. Young, 14 Ainslie Place, or Dr. Peel Ritchie, 1 Melville Crescent.

Glasgow Ophthalmic Institution.—On the 11th inst., the distribution of prizes in connection with this institution took place in the buildings, West Regent Street, Dr. James A. Campbell, of Stracathro, presided, and handed the prizes to the successful competitors. About fifty students attended the classes during the past session.

Death of Dr. Watson, of Grangemouth.—Dr. J. D. Watson, who practised in Grangemouth for more than twenty-six years, died on the 7th inst. Until failing in health he was the only resident practitioner in Grangemouth. He was very much respected in the locality.

Action against the Trustees of the Glasgow Training Home for Nurses.—In this action Mrs. Hay and her husband, who is a shipping and forwarding agent in Glasgow, and residing at 240 Renfrew Street, Garnet Hill, Glasgow, sought to have the manager and trustees of the Glasgow Training Home for Nurses interdicted from using the building which they have at present in course of erection for the purpose of a training home for nurses, and in particular from using it as an hospital for patients under medical and surgical treatment, or, at least, for the reception of patients afflicted with infectious disease. The complainants averred that the respondents were erecting the building complained of at the junction of Renfrew Street and Thistle Street, and they stated that such a use of the building was in violation of the titles under which the complainants held their feus. They also averred that the introduction of the hospital would greatly diminish the quietness and amenity of the district, and would interfere with the comfort of their property. Medical and other evidence was led at considerable length. Lord Curriehill, in the course of the decision, said it had been proved in the clearest possible manner that the requisites of an hospital of this kind were airiness, perfect cleanliness, and the absence of everything in the shape of infectious disease, and all these requisites were secured in the buildings in question. It was physically impossible that anything could come out of the buildings into the neighbourhood of the nature alleged by the complainers. He thought that the objections of the complainers were founded on certain imaginary evils, and that these objections were in some degree sentimental. They had pictured all sorts of things lying about, including poultices, pale faces looking out of windows, mattrasses from

Digitized by Google

the infectious building being aired in public, and so forth; but these were merely imaginary things. The judgment he, therefore, would pronounce would be—(1) That the respondents had for several years in the St. George's Road had an institution for the training of nurses, and an hospital similar to that which they proposed to establish in the new premises being built at the corner of Renfrew Street and Thistle Street. (2) That the first institution had been conducted in such a manner as not to be "nauseous." (3) That the complainers had failed to prove any reasonable ground for apprehending that the proposed use of the respondents' new premises would be nauseous to the complainers or other neighbouring residents.

Correspondence.

IRISH GRADUATES' ASSOCIATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Will you permit me, through the medium of your widely circulated journal, to make known that the above Association receives as members "Irish graduates, wherever resident," and also "Irishmen practising with other qualifications, as Associates." As the first movement to form the Association began in England an impression seems to have gone abroad that it was confined to Irishmen practising in England. On the contrary, we desire to embrace the widest possible numbers. The circulation of this will, I hope, induce those who reside in Ireland to join the Association, and take part in the annual meeting which will be held at Cork on Wednesday, August 6th, under the presidency of W. MacCormac, F.R.C.S.I. & E., of St. Thomas's Hospital. I hope to be able to advertise the meeting in your next issue. If any gentleman desires to join will he kindly send his name, address, and qualification to me? I will see that he is duly elected. I should mention that the subscription is at most 5s.

Yours faithfully,

JAMES THOMPSON, Hon. Sec.

Leamington.

Novelties.

EVANS'S FLUID EXTRACT OF RED CINCHONA.

THIS preparation supplies a want that has been long felt, namely, a good preparation of red cinchona bark. In fact, many of us must have often regretted that there is no preparation of this bark in the British Pharmacopœia. This Extract is the more deserving of notice considering the attention which its alleged efficacy in the cure of drunkenness has attracted from the profession. Of its virtue in this respect we have not had much experience, but we believe Dr. Norman Kerr thinks that it is a valuable adjuvant to other remedies in the treatment of dipsomania. It is, in his opinion, of great use in helping to restore the diminished tone and power of the mental and physical constitution of the patient. We have, however, prescribed the Fluid Extract in other cases, and have found it to be not only a very efficient preparation, but sometimes to agree with the stomach better than either the infusion or the decoction of the yellow bark.

A SELF-RETAINING SIMS' SPECULUM.

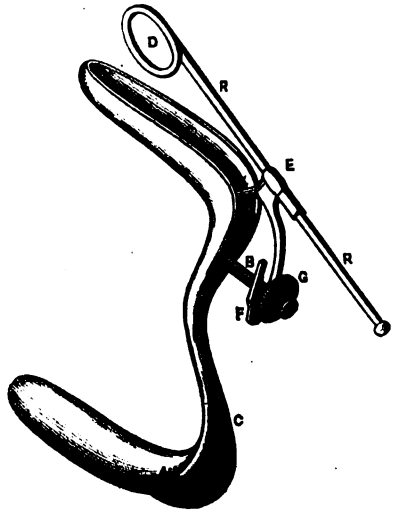
THE Sims' speculum is, undoubtedly, a most invaluable instrument, but its greatest drawback is, that it requires an assistant in using it. If the practitioner attempts to use it alone he occupies the left hand with holding the instrument in position, while the right is engaged in elevating the anterior wall of the vagina by means of the depressor; thus both hands being in use manipulation is impossible.

The present modification, designed by Dr. Goelet, of New York, consists of a moveable attachment of a depressor to an ordinary Sims' speculum, and will remedy this disadvantage.

Dr. Thomas' modification of Sims' speculum does the same thing in a measure, but this also has its disadvantages. It consists of one blade fastened to a handle, with the depressor attached to a lateral arm projecting from the base of the blade, which is much widened at that point to accommodate it. The attachment is fixed, *i.e.*, cannot be removed, and there is only one size blade.

The advantages then of the present modification are viz.: The attachment may be made to any Sims' speculum. It may be used without an assistant. The attachment, which is moveable, may be fixed and used with either the large or small blade. The attachment being moveable, the speculum may be used without it if so desired. The speculum may be first introduced and the depressor attached afterwards. When introduced and the depressor fixed in the desired position by the thumb-screw, it will retain this position without further support. This is a point of gain which had not been anticipated for it, but which has been proved by repeated experiments.

The attachment consists of a small arm *only* large enough to hold a screw, riveted to the Sims' Speculum at A^1, where the depressor is attached by means of a lock like that of a Hodge obstetric forceps. At B a standard, upon which the thumb-screw G works, is made to screw in, and may be removed or screwed in at C when it is desired to use the smaller blade. At A^{11} is the arm for the attachment of the depressor to the smaller blade. The depressor is a light steel rod R R which terminates in an oval ring D, and slides up and down through the upper end of the lever at E. The lower end of the lever F slides up and down on the standard B, and may be fixed at any point by means of the thumb-screw G.



The instrument may be introduced in two ways, viz.: First, with the depressor attached but drawn back to its limit, when it will not interfere with introduction; or second, the lever and depressor are first detached, leaving only the small arm A and its screw, and the standard B attached to the Sims' speculum. The blade is then introduced in the usual manner, and carried well behind the cervix. Being steadied in that position by the left hand, the lever, with the depressor well drawn back, is attached at A with the right, and by means of the screw locked. The depressor is then slided along in the groove of the Sims' blade until it comes to its extremity, when it is separated from it ¾ of an inch. Then by placing the

Digitized by Google

thumb of the left hand on the lower part of the lever at F, the cervix may be lifted into any position desired, and held there by means of the thumb-screw G.

THYMOL SOAP.

We have used a good deal of both the carbolic acid and thymol soaps, and must say that in many respects the latter is superior to the former preparation. While thymol is as powerful a disinfectant and antiseptic as carbolic acid, it has a much more agreeable odour. We have found that some people object to the odour of soaps containing carbolic acid, while others find that these soaps leave, through the astringent action of the acid, an uncomfortable feeling on the skin. The thymol soap we have tried (Messrs. Squire's, of London, and Messrs. Richardsons, of Leicester), is free from these objections, and is therefore well adapted for general family use.

KEPLER'S MALT EXTRACT.

We have on more than one occasion drawn attention to the nutritious and therapeutic properties of these Malt Extracts. Their great value consists in the fact that when taken at or directly after meals they assist the weak stomach in disposing of the food, and thus, indirectly, nourish and strengthen the whole system. We find that Kepler's Extract is as reliable a preparation as any of the kind. It is quite free from acidity, and it is manufactured in such a careful manner as to ensure the preservation of its most valuable constituents.

Literature.

ANATOMY AND PHYSIOLOGY OF MAN. (a)

In the work before us Mr. Bale has sought to achieve more than is possible in attempting to compress within the limits of some two hundred and eighty octavo pages any sufficient account of the structure and functions of the human frame. Almost the best that can be said of the book is that it does not fulfil its author's intent, and it only serves as another illustration of that useless but constant striving on the part of a certain class of writers, to render the acquisition of hard dry facts more simple and less arduous than, from the very nature of scientific study, it must necessarily be. Avowedly addressed to students and schools, in no wise will it suffice to carry the student who trusts to it alone through an examination that supplies any searching test of knowledge, while the excellence it possesses, its *prècis* character, will effectually bar its admission to the schools where science holds a place in the curriculum.

There are before the student world, at the present time, so many valuable elementary works on anatomy and physiology, that some good and sufficient reason must be advanced in support of a new candidate to favour, ere its claims are likely to receive support. Such a reason Mr. Bale presumably offers, when he tells us that "after searching, as a student, amongst the various hand-books in common use, and finding them very incomplete, and containing many *hereditarily transmitted errors* and descriptions of obsolete experiments," he "felt compelled to have recourse to the writings of such original authorities as were available, supplementing them with a few experiments." The italics are our own, but this quotation is a fair sample of the style indulged in by the author of a work that aspires "to give with the greatest brevity consistent with clearness, as much of the outlines of human anatomy and physiology as would present to the early student a fairly accurate reflection of the exact state of this field of science." Either Mr. Bale, as a student, was excessively unfortunate in his selection of text-books, or the days of his student career must have been far back indeed to have been cast in so dark a period as his words picture forth; and however it may satisfy the author of a new book to state that "excepting for a few of the most recent discoveries, recently incorporated," he owes nothing to "the several excellent treatises on physiology," yet he cannot be excused the assertion, "up to the present time there has not existed any scientific *prècis* (in the English language) of anatomy, histology, or embryology." We are compelled to infer the grossest ignorance on Mr. Bale's side of the literature of his science during the last dozen years, or else that he is hugely at variance with the general verdict on the merits of at least Huxley's "Elementary Lessons in Physiology," Cleland's "Physiology," Angell's "Human Physiology," Foster and Balfour's "Embryology," Rutherford's and Schafer's "Histology," *et hoc genus omne.*

It should be said that Mr. Bale's faults are of omission rather than commission. There are few absolute errors in the book, and such as may be taken exception to follow probably from the author's peculiar style. Thus, on p. 185, it is stated, "Each organ has practically its own proper stimulus, *e.g.*, irritation of the conjunctiva and the secretion of tears; blood deficient in oxygen causing the respiratory movements, the blood upon the heart causing its beating." Admirable as a terse and vigorous expression is, and especially in a scientific treatise, only a meaningless jumble results when such liberties as this are taken with living words. If Mr. Bale has discovered that the movements of respiration are induced by a direct reaction between deoxygenated blood and the pneumogastric nerve, then his original experiments have acquainted him with a new fact of surpassing interest. But if he means, as he undoubtedly does, to indicate that an *impulse* transmitted to the respiratory centre in the medulla excites herein an efferent motor impulse, then the passage quoted affords no clue to his intention. Similar unprecise passages could be quoted, had we but space to deal with them, but it is fair to add that they are not very numerous.

Mr. Bale clings to certain superstitions, probably cherished with other mementos of the dark student days. He tells us that the first heart sound is produced "by the sudden closure of the auriculo-ventricular valves," and is seemingly ignorant or careless of Ludwig and Dogiel's observations on the bloodless heart, as of the want of unanimity of opinion on the point he so summarily dismisses. In numberless instances is this want of fulness to be lamented, and though it can be explained on the score of limited space, this only emphasises our conviction that the book must suffer in value from such forced meagreness of detail. The aim is too embracing to admit of adequate fulfilment. There is no history of urea, of hippuric acid, or of glycogen to be found, and indeed scarcely anywhere are physiological processes more than referred to, so that as a Manual of Physiology the work is nearly useless. For the rest, the sections on the anatomy of the osseous and nervous systems, and on embryology, are the best, and may be useful to the student who does not seek any detailed or extended acquaintance with his subject. But the whole work is marred by the employment of a style that can only prove ungenial, not to say repulsive. The use of such terms as *infelicific* (preface, p. viii.) *ciliæ* (p. 204), and the infelicitous choice of language exhibited in such a sentence as "but the more irritable centre the more so, as is the case in disease" (p. 197), or again, "one grain of muscle can perform 10 oz. (p. 16) of work," detracts much from even such passive merit as the work possesses.

Messrs. Remington and Co. have issued the volume in a creditable and respectable form; especially do we draw attention to the improved plan of confining the sheets by wire stitches in place of the old twine binding which so interfered with the comfort of reading.

(a) "Anatomy and Physiology of Man." By G. G. P. Bale, M.A. London: Remington and Co. 1879.

Medico-Parliamentary.

HOUSE OF COMMONS.

THE IRISH GRAND JURY BILL.

Mr. D. Taylor—I beg to ask the Chief Secretary for Ireland if (considering the lateness of the session and the state of public business) it is his intention to proceed any further with the Grand Juries (Ireland) Bill?

Digitized by Google

Mr. LOWTHER—Sir, I am not very hopeful with regard to the passing of this Bill, and, no doubt, shortly it will be the duty of the Government to make some statement with regard to measures which will not be proceeded with, and I will in the meanwhile consult with my right hon. friend the leader of the House as to the position of the Bill.

THE MEDICAL ACTS AMENDMENT BILL.

IN a programme of the "Business of the Session," which the Government intended to proceed with or abandon for lack of time, the Chancellor of the Exchequer, on Monday evening, made no allusion whatever to the progress of the Medical Acts Amendment Bill. We fear, therefore, it will be again numbered this year, as last, with the "slaughtered innocents." It is just possible time may be found at the fag end of the session to receive the report of the Committee, and to pass the Bill, but this is not in the region of probability, and the studied silence of the government oracle is sufficiently ominous to foreshadow naught but disappointment to the hopes of the profession.

THE MEDICAL ACTS SELECT COMMMITTE.

FRIDAY, JULY 11TH.

(*Continued from page 48.*)

THE EDUCATIONAL STANDARD.

Sir JAMES PAGET examined.—Did not think that the standard of examinations was too low. The London College of Surgeons examines in pathology and anatomy, but not in chemistry, materia medica, and midwifery. The College of Surgeons in Ireland examines in midwifery, which he considered a great advantage. He considered that the Council had failed in its object through want of powers. He believed that the average English practitioner is more competent than those of any other country, without excepting even Ireland. If in his consultations with them he had met ignorance once he had met knowledge twenty times. His opinion on direct representation entirely coincided with the paper which had been forwarded by Mr. Simon. There would be no harm in having representatives if they could be elected by any other means than that of a general election. His objection to a general election lay in the expense that it would entail, and the personal influence that might perhaps be exercised by the medical journals. It would be a great advantage were the Crown to elect the members. He thought that no man should hold the post of examiner for more than five years. The medical men of the United Kingdom are at present, generally speaking, highly educated. Not only have they practical knowledge, but also that scientific knowledge which always urges a man to study. All the Council of Medical Education can do is to see that a man knows enough to make him a safe practitioner. Precautions should be taken against allowing men to pass by "cramming." It would be a great impediment to medical education if any facilities were to be afforded for "cramming." If a school has a large proportion of its men rejected for a few successive years, it of course loses its reputation. Teachers have, therefore, a pecuniary, as well as professional, interest in the success of their pupils. A wholesome competition thus exists. The result of examinations held at present is far more satisfactory than that of those held some years ago. Some years ago complaints were made that the Medical Register was not accurately kept, but that has improved of late years. He thought that the conjoint system can be introduced into this country without the assistance of Parliament. The Conjoint Scheme would place England in a disadvantageous position in respect to other countries. Fees have very little to do with inducing people to go to particular schools. Few men will be deterred from going to a particular school by the fact of its fees being a little higher than those of another. The cost of a medical education in England is from 90 to 120 guineas. The rivalry which exists between the different teaching establishments is a great advantage to the student. The London College of Surgeons grants its licence on payment of £20. In every school about 15 per cent. of confirmed idlers is met with, besides a large number who will not do an iota more than is rendered absolutely necessary by their examination. In England dead bodies are not introduced into examinations, for the large number of candidates present would preclude us from having a sufficient number of subjects. Considered 120 guineas a very moderate sum to pay for a medical education, considering that for that sum lessons are received from the best men for four years.

The CHAIRMAN.—The conjoint scheme would be a source of economy?

Sir JAMES PAGET.—Yes, I think so. When the visitors have made an unfavourable report in connection with an examining body, it usually has the effect of exciting it to new exertions. I have heard it said that some of the examinations in Ireland and Scotland are not so high as they ought to be, but still they are not so low as to be unsafe.

THE ROYAL COLLEGE OF SURGEONS, IRELAND.

In reply to Dr. O'LEARY.—The examinations of the Irish College of Surgeons are public, inasmuch as any medical man can obtain admission to them. In the Irish College of Surgeons there are two examiners, one of them sitting as an assessor. In Ireland more courses of practical anatomy must be attended than in England and Scotland. The Irish College of Surgeons examines both in chemistry and midwifery. A year more of lectures is necessary in Ireland than in England. Chemical tests and dissection of the dead body are employed in the examination of the Royal College of Surgeons in Ireland.

The Committee then adjourned.

MEDICAL CORONERS.

WE learn with astonishment that the Select Committee on the Coroners' Law, which is sitting, has adopted, upon a division, the following clause:—"A person shall not be qualified to be a coroner for a county or borough unless at the time of election he is either a barrister in actual practice of not less than five years' standing, or a solicitor of the Supreme Court of Judicature in actual practice of not less than five years' standing, or a barrister or a solicitor of the Supreme Court of Judicature in actual practice who has been in practice for not less than five years, partly as a barrister and partly as a solicitor." The effect of such a clause, if it should ever become law, would be for ever to exclude medical men from coronerships, but we have sufficient confidence in the good sense of the Government and of Parliament to believe that they will see, at the first blush, the patent folly of excluding medical men from the office of deciding as to the causes of death. It will, however be well for the Coroners' Association, and those organisations which represent the profession, to be watchful and ready to act in opposition to the proposal when the proper time arrives. There is certainly something of the ludicrous in the suggestion that we should proceed to ascertain what a person died of by carefully excluding the only class who can possibly have a special knowledge of the subject.

SANITARY SALARIES IN IRELAND.

WE invite the attention of Irish sanitary officers to the fact that an agitation has arisen in many unions throughout Ireland to reduce the salaries of sanitary officers, the movement being prompted by the "hard times," the necessity of making a retrenchment somewhere. The well-known disposition of the sanitary authorities throughout the country to impede sanitation, and the patent fact that very little good work is, in many instances, returned for the salaries. The policy of the Local Government Board, and of the sanitary authorities gradually is, in fact, recoiling upon the sanitary officers, who are in danger of disestablishment, because it is felt that in many instances they can be done without, if matters are to go on as hitherto.

The fact is, that the working of the Public Health (Ireland) Act has been completely defeated by the policy of Sir Alfred Power, as head of the Local Government

Digitized by Google

Board, and the indisposition of the country guardians to enforce cleanliness. When the Act became law, the medical officers were ready and anxious to perform their sanitary duties, but they were, at the outset, given to understand by the guardians that they would be paid almost nothing, and that their activity would be regarded as a nuisance, and, so far from combatting such a policy, the Local Government Board chimed in and aided the sanitary authorities in defeating the law. Many of the sanitary medical officers thought it their best course to accept the hint and draw a nominal salary for less than nominal duties, and, as a consequence, they are now threatened with total disestablishment. The whole system is breaking down under the influence of a determined official obstruction, which no system could survive.

ROYAL COLLEGE OF SCIENCE, DUBLIN.

Mr. Hartley, Demonstrator of Chemistry, King's College, London, has been appointed Professor of Chemistry in the Royal College of Science for Ireland, in room of Professor Galloway.

Obituary.

MR. C. F. MAUNDER, F.R.C.S.

It is with great regret that we announce the death of Mr. Maunder, Surgeon to, and Lecturer on Clinical Surgery at the London Hospital. Mr. Maunder's name has been for long well known as an operating surgeon, and as one who invariably took a leading part in discussions at the Clinical and other medico-scientific societies. He served in his earlier years with the army as civil surgeon in the Crimea, and was the author of several useful essays, among which may be mentioned the article on "Intestinal Obstruction," and the translation of Ricord's lectures on chancre.

His name was associated with the operation of subcutaneous osteotomy, for which he suggested the use of the chisel instead of the saw. He was in full health and vigour until the recent closure of the West of England Bank, in which he unfortunately happened to possess some few shares. The failure of the bank, and the serious loss he sustained overcame his mind, and he was obliged at once to seek rest in the country. A few days ago more serious symptoms presented themselves, and he was placed under the care of a medical friend, in whose house, it is said that he, whilst unwatched, and in a moment of frenzy, precipitated himself from the window.

His loss will be universally regretted, for he had succeeded in making for himself a good name, as well as a lucrative practice.

Medical News.

Baron Rothschild's Bequests to Medical Charities.—The bequests of this nobleman, recently deceased, to hospitals, &c., are as follows:—St. George's Hospital £500; London Hospital £1,000; Evelina Hospital £500; Hospital for Sick Children £300; Bournemouth Sanatorium £50; Metropolitan Convalescent Home £50; Seaford Convalescent Home £50; Royal Bucks Infirmary £500; Hertfordshire Infirmary £150; Hospital for Women £200; and Hospital for Diseases of the Chest £100.

St. Thomas's Hospital.—The annual distribution of prizes took place on Thursday last, by Mr. Alderman McArthur, M.P., to the successful students in the Medical School attached, during the winter session 1878-9:—Entrance Science Scholarships: W. W. Hull. The William Tite Scholarship, £30: F. H. Furnival. College Scholarship, 40 guineas, W. W. Jones; College Prize, £20, C. W. Haig-Brown; College Prize, £10, Melville R. H. Jay; Musgrove Scholarship, 40 guineas, and College Prize, £20, W. A. Duncan. Physical Society's Prizes: Society's hird Year's Prize and Certificate of Honour, W. A. Duncan; Society's Second Year's Prize and Certificate of Honour, G. D. Thudichum. Grainger Testimonial: Prize £20, W. A. Duncan. The Cheselden Medal, K. Takaki. Practical Medicine: the Mead Medal, T. D. Acland. For General Proficiency and Good Conduct: the Treasurer's Gold Medal, Kanehiro Takaki.

East London Hospital for Children.—Mr. Charrington, Chairman of the Board of Management of this Hospital, presided last Wednesday at the distribution of prizes in connection with the training of nurses which is going on at this institution. The first series of lectures, which was given by Mr. Hayward, Resident Medical Officer, during the past winter, consisted of elementary physiology and chemistry, each lecture being illustrated by experiments and demonstrations. Thus, among the other subjects, food and its digestion were fully explained, and also the chemistry of air, including ventilation, and water. The lectures seemed to be highly appreciated, and at the end of the session an examination was held. Seeing how important it is that those who are in charge of the sick should understand something of the *rationale* of disease, in order the more intelligently to carry out the instructions of the medical man, we commend the authorities of this hospital for the good work they have instituted.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

Henry B.—You would probably find the Baths of Harrogate, Lisdoonvarna, or Donegal as effective in your complaint as foreign springs, especially as "convenience of distance" is of importance to you. If, however, a foreign spa be preferred, Aix-les-Baines or Aix-la-Chapelle would be as good as any. Before deciding, we would suggest consultation with a physician who has made the subject his especial study; there are one or two such in your city.

Haven't Time to Read.—The man who gives as his excuse for not subscribing to a new journal, or for dropping one or more that he is already taking, "I haven't time to read so many," is, in nine cases out of ten, a poor tool. The busiest, most successful men in the practice of medicine are those who read most and write most; it is only the dawdler and the drone who "can't find time to read."—*Maryland Med. Journ.*

Mr. Freer.—We have not received previous lists, and cannot therefore insert one now sent, as it would not now be understood.

Mr. Fraser.—The Committee on the Contagious Diseases Acts is now taking evidence.

M. S. E.—The communication is more suitable for the columns of *The Analyst* than for a medical journal. Sorry we cannot find room.

Dr. Tilt.—The paper was duly received and acknowledged in our columns. It will appear shortly.

Dr. Mitchell, Paris.—There was a previous paper. There are two other communications of Dr. Tilt's yet to appear.

Mr. Lamberg.—It is not customary to pub lish editors' names to correspondents. You will have no difficulty in gaining an introduction through the ordinary channels.

Dr. John Lowe is thanked.

Mr. Spencer.—All we know of the Society will be found in our "Literary Notes and Gossip" last number. The Secretary's office is in the Adelphi.

Dr. Fenton.—An English translation of "Bright's Disease of the Kidneys," by Prof. Charcot, has just appeared. The work is a most valuable contribution to the literature of the subject. We have a critical notice in hand.

Medical Temperance Association.—A meeting of this Association will be held in the rooms of the Medical Society of London to-morrow (Thursday), July 17. The President, Dr. B. W. Richardson, F.R.S., will take the chair at 4 p.m., and will exhibit his newly-invented sphygmophone and also Professor Hughe's audiometer. A *précis* of the latest annual vital statistics of the United Kingdom Temperance and General Provident Institution will be presented by Dr. J. Edmunds. A *précis* and review of recent experimental researches on the toxic power of the alcohols, by Drs. Dujardin, Beaumetz, and Audigé, will be presented by Dr. Norman Kerr. All medical practitioners are invited to attend.

IRISH POOR-LAW INTELLIGENCE.

QUARTERLY REPORT OF HEALTH OF DUBLIN AND SUBURBS, ENDING JUNE 28, 1879.

TOTAL registered deaths in Dublin and suburbs, 2,860; ten years' average same quarter, 2,069; excess of mortality above average, 791. Quarterly mortality of the entire Dublin district, 36·4; London, 22·4; Glasgow, 22·0; Edinburgh, 20·5.

The deaths for the last three months would thus appear to be 38 per cent. in excess of the average number for the June quarter, but in reality, although undoubtedly the mortality last quarter was excessive, it was not so to the extent indicated by these figures. In the course of the quarter, under the provisions of section 191 of the "Public Health (Ireland) Act, 1878," returns were obtained of the interments in the several Dublin cemeteries since the 1st January last. These returns enabled the registrars to effect the registration of very many deaths which would otherwise have remained unregistered, so that not only was registration much more complete than in previous years, but 286 deaths which occurred in the first quarter of this year and nearly all of which, but for the burial lists would have escaped registration, were discovered, and are included in the 2,860 deaths recorded last quarter. However, this derangement of the registration statistics is only a temporary disadvantage, and is far outweighed by the improvement in the registration of deaths that must be effected through the burial returns, which will be regularly furnished in future.

The deaths north of the Liffey registered last quarter were 38·9 in every 1,000; south of the river, 36·6. In the suburbs of Rathmines, Donnybrook, Blackrock, and Kingstown, 26·3 in every 1,000.

Diseases.—Dublin Registration District.—The number of deaths from zymotic diseases registered last quarter is 521, being 149 less than in the first three months of this year, but 111 over the average number for the second quarter of the ten years 1869-78. Omitting 19 deaths of persons admitted into Dublin hospitals from localities outside the Dublin Registration District, the seven principal diseases in this class proved fatal in 393 instances, being equivalent to an annual mortality of 5·0 per 1,000 inhabitants, the deaths consisting of 118 from small-pox, 81 from scarlatina, 77 from fever (20 typhus, 51 typhoid, and 6 simple continued fever), 60 from measles, 29 from diarrhœa, 21 from whooping-cough, and 7 from diphtheria.

In the preceding quarter the deaths from small-pox numbered 251; last quarter the total number was only 125, of which 45 are chargeable to the North City Districts, 52 to the South City (where 165 occurred in the previous quarter), 13 to Rathmines, 8 to Donnybrook District, and 7 were hospital cases admitted from without the Dublin Registration area.

At the close of the March quarter there were 117 small-pox cases under treatment at the various Dublin hospitals; during the thirteen weeks now ended, 462 new cases were admitted (being 296 less than in the preceding quarter), 395 patients were discharged, and 91 died, leaving 93 under treatment on Saturday, 28th June. In the first four weeks of the quarter 107 new cases were admitted; in the succeeding five weeks 214, and in the last four weeks 141; the weekly number varied from 20 in the weeks ending 12th April to 63 in that ending 24th May; 24 cases were admitted during the last week of the quarter.

Deaths from diseases of the respiratory organs were much above the average for the June quarter; they amount to 607, comprising 447 from bronchitis, 112 from pneumonia, 5 from pleurisy, 4 from asthma, 1 from laryngitis, and 38 from lung disease undistinguished. The deaths in this group form 21 per cent. of the mortality from all causes, and are equal to an annual rate of 7·7 per 1,000 of the population.

The number of deaths ascribed to convulsions is 242, of which 238 were amongst children under 5 years of age, being 27 per cent. of the total deaths of that age.

Heart disease caused 121 deaths, aneurism 6, and pericarditis or inflammation of the heart's covering 4.

Forty-seven deaths were referred to paralysis, 42 to apoplexy, 30 to cephalitis, 29 to insanity, 22 to epilepsy, 23 to other diseases of the nervous system; 4 to hepatitis, 1 to jaundice, 27 to "liver disease," 2 to spleen disease; 12 to Bright's disease, 4 to nephritis, 4 to cystitis, 1 each to diabetes and stone in the bladder, and 16 to kidney disease undistinguished.

Phthisis caused 359 deaths, or 12·6 per cent. of the deaths from all causes, mesenteric disease 47, scrofula 25, hydrocephalus 60, cancer 44, and gout 6.

Forty-one accidental deaths, 2 cases of homicide, and 2 of suicide were registered.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF JUNE, 1879.

JUNE 2nd.—Ryan, Joseph Aloysius; Simmons' Court, Donnybrook, County Dublin; Lic. R. Coll. Surg. Edin 1877, Lic. Apoth. Hall, Dub. 1875.

3rd.—Peyton, Andrew Dillon; Ballaghaderrine, co. Mayo; Lic. R. Coll. Surg. Irel. 1876, Lic. K. Q. Coll. Phys. Irel. 1879.

4th.—Burgess, John Joseph; 9 Victoria Terrace, N. Circular Road, Dublin; Lic. R. Coll. Surg. Irel. 1878.

5th.—Kilkelly, Charles; Surg.-Major Bengal Army, and Upper Fitzwilliam Street, Dublin; Lic. 1853 and Fell. 1855, R. Coll. Surg. Irel., M.B. Univ. Dub. 1854.

6th.—Quirk, Patrick Joseph; Tullamore, King's Co.; Lic. Fac. Phys. and Surg. Glas. 1879.

6th.—Allan, William; 18 L. Gardiner St. Dublin; Lic. R. Coll. Surg. Irel. 1879.

7th.—Daly, Fredk. Herbert; 225 Stretford Road, Man-

chester; Lic. R. Coll. Phys. Edin. 1879, Lic. R. Coll. Surg. Edin. 1879.

9th.—Lentaigne, John Vincent; 1 Gt. Brunswick Street, Dublin; Lic. R. Coll. Surg. Irel. 1879.

9th.—Emerson, John, Joseph; 1 Belgrave Park; Rathmines, co. Dublin; Lic. R. Coll. Surg. Irel. 1875, Lic. 1878 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

10th.—Carr, John Mitchell; Tullamore, King's Co.; Lic. R. Coll. Surg. Edin. 1878.

14th.—Heffernan, Wm. Francis; Mocklestown House, Clonmel, co. Tipperary; Lic. R. Coll. Surg. Irel. 1878, Lic. 1879 and Lic. Mid. 1879 K. Q. Coll. Phys. Irel.

16th.—Horsford, Benjamin; Bandon, co. Cork; Lic. R. Coll. Phys. Edin. 1879, Lic. R. Coll. Surg. Edin. 1879.

19th.—Wray, James, Stewart; Rockfield, Castlefinn, co. Donegal; Lic. R. Coll. Phys. Edin. 1879, Lic. R. Coll. Surg. Edin. 1879.

19th.—Legge, Richard John; Clonmel, co. Tipperary; Lic. Apoth. Hall. Dub. 1879.

21st.—Stokes, Henry George; Pelham Vicarage, Canterbury, Kent; Lic. R. Coll. Surg. Irel. 1878.

23rd.—Oldham, Geo. St. John; 3 Albert Terrace, Douglas, Isle of Man; Lic. R. Coll. Surg. Irel. 1879.

27th.—Burke, Julio Page; Abbey View, Killaloe, co. Clare; Lic. R. Coll. Surg. Irel. 1878, Lic. 1879 and Lic. Mid. 1879 K. Q. Coll. Phys. Irel.

28th.—Barton, James Robert; Farnderg, Dundalk, co. Louth; Lic. R. Coll. Surg. Irel. 1878, Lic. 1879 and Lic. Mid. 1879 K. Q. Coll Phys. Irel.

28th.—Battersley, John; 44 Stephen's Green East, Dublin; M.B. 1879, and B.Ch. 1879 Univ. Dub.

ATHY UNION.

CONSULTATION FEES.

A LETTER requesting payment of £2 2s. from Dr. O'Neill for assisting Dr. Kilbride in consultation and in operation in a difficult midwifery case, was brought before the board, some of the guardians considering the fee too high.

Dr. O'Neill—You will find the rule under the head of the Duties of Relieving officer. He is bound to call in a second medical man when requested to do so by the dispensary doctor.

Chairman—But the relieving officer has no power to regulate the sum.

Dr. O'Neill—My ordinary fee is two guineas, and during the time I was acting as dispensary doctor I have been paid it at least ten times.

Chairman—I think, Doctor, they pay such sum as they consider reasonable under the circumstances of each case.

Dr. O'Neill—I think not; I looked upon myself as acting in my private capacity as a medical man, and not acting for the guardians. It is to the relieving officer I will look for my fee.

Mr. O'Beirne—If we are legally bound to pay the bill, we must do so; but if we have power, we ought to cut down the bill. These medical gentlemen have no regard for the rates.

Dr. O'Neill—I was engaged from three o'clock in the morning until ten o'clock.

Chairman—In that case I do not consider the fee too high.

Dr. O'Neill—When I am acting in my private capacity, if I do not see the guardians disposed to pay me my ordinary fee, I will decline to go again when called on. The guardians can send some person else.

Mr. Redmond—Let the opinion of the Local Government Board be had on the matter.

Chairman—In this particular instance I do not consider the sum too high.

Mr. O'Beirne—I think not either; but I do object to Dr. O'Neill's doctrine that no matter what the case was he would charge two guineas.

Dr. O'Neill—I wish the board to come to a distinct understanding, and say if they refuse to pay me, and I will not attend in future.

Chairman—We could not bind any action a future board may choose to take.

Dr. O'Neill—Failing to elicit the opinion of the board, I now state that the dispensary doctor will not have my assistance in future for less than a fee of two guineas.

Chairman—Let that go on the minutes exactly as the doctor says it.

[The independence evinced by Dr. O'Niell is worthy of every approval. The fee claimed by him is quite reasonable, and there is no reason whatever why he should accept less from the guardians.—ED. M. P. & C.]

WATERFORD UNION.

PAYMENT OF MEDICAL OFFICERS' TEMPORARY SUBSTITUTE.

THE following letter was received from Lord Charles Beresford, M.P.:—

"SIR,—Having inquired into the subject upon which you have written in your letter of June 15th, I find that I cannot move in the matter, as it appears that the statement made by the Board, viz., that there is no provision in the parliamentary grants for the payment of temporary substitutes for medical officers, is a correct one. I am, therefore, afraid that I cannot help you in this matter.—With much regret, I am, sir, yours faithfully,

"CHARLES BERESFORD."

Mr. Fisher said that the object of the Board was that Lord Charles Beresford might call the attention of the House of Commons to the necessity of the provision. He would suggest that he be therein requested to ask the Chancellor of the Exchequer if any provisions could be made.

The Clerk, in reply to the Chairman, said that he had written to the other members also on the subject, addressing all the letters to the House of Commons.

Letter read from the Local Government Board, enclosing one from Mr. Fisher, respecting the provisional relief.

"SIR,—Several cases came before the Board of sick persons, one of whom is costing the electoral division per 7s. 6d. week for maintenance, and 5s. per week for a nurse, and in these cases, as well as in that of Conolly, the dispensary medical officers decline to certify that they are fit cases for removal.

"In most of these cases the sick poor would be greatly benefited by being removed from wretched ill-ventilated rooms to the Workhouse Hospital, and the rates would be saved; but the medical officers do not wish to run the risk of censure in case of fatality—though in their opinion improbable—should ensue, and I fear the course adopted by your Board in other cases has been detrimental to the poor and injurious to the ratepayers, and I think a less arbitrary course would be beneficial to both.—I am, sir, yours respectfully,

"JOSEPH FISHER."

"Local Government Board,
"Dublin, June 19th, 1879.

"SIR,—The Local Government Board for Ireland acknowledge the receipt of your letter of the 14th inst., referring to certain cases of poor persons in Waterford Union where out-door relief and attendance have been provided by the Board of Guardians, and in reference thereto the Board desire to state that all of the cases referred to by you, appear to be those of sick persons, and it is therefore lawful for the Board of Guardians to afford relief either in the workhouse or out of the workhouse, as to them shall appear fitting and expedient in each individual case. The Local Government Board are not aware what is the course to which you refer as having the effect of interfering with the removal of fit cases to hospital.—

"By order of the Board,
"B. BANKS, Secretary."

Digitized by Google

"Waterford, June 21st, 1879.

"SIR,—The last paragraph of your letter surprises me. I thought your Board had some knowledge of the working of the Poor-law, but 'where ignorance is bliss 'twere folly to be wise.' Its order of 1869 requires dispensary medical officers, when called on, to give a certificate as to the fitness or unfitness of removal to hospital. This is only an expression of opinion, and is not an order. The removal, if it takes place, is not his act, but if death ensues with forty-eight hours, he is virtually put on his trial. If death takes place within the same period without removal, there is no inquiry. With such unfairness to the medical officer, is it any wonder that the poor are left in unwholesome, ill-ventilated rooms, at very great additional expense to the ratepayers, who though they maintain an hospital for them, are also taxed for nurses, for food, and for medicine, under the out-door relief system?

"I am, sir, yours respectfully,

"JOSEPH FISHER."

The Board resolved that the Local Government Board be informed that the cases referred to by Mr. Fisher were those in which the relieving officer had afforded provisional relief, and not those in which it was ordered by this Board.

KEADY DISPENSARY.

LETTER received from Dr. John Leeper, resigning the charge of the Keady Dispensary from ill-health. The Committee of Keady Dispensary unanimously join in expressing their deep regret at Dr. Leeper's resignation, and strongly recommend to the favourable consideration of the Board of Guardians that he should be allowed the fullest retiring allowance, he having served thirty-four years, faithfully, attentively, and with extreme kindness to the poor.

CARRICK-ON-SUIR GUARDIANS.

AN IRISH GUARDIAN ON THE ITCH.

READ letter from the Local Government Board, as to an epidemic of scabies in the workhouse.

Mr. Lalor said he had been speaking to a gentleman in Waterford on yesterday about this matter, and he had been informed that a bath was not a necessary thing. Diseases of that kind were treated successfully by breaking in some way the pustules, *and making the person scrub themselves*. Then there was an ointment which was applied, after which the patient was put to bed for twenty-four hours.

PILTOWN DISPENSARY.

RESOLVED that leave of absence be given to Dr. O'Meara on account of ill-health. Dr. Thos. Martin, of Portlaw, was appointed substitute at £3 3s. per week.

Mr. Wilson thought the fee too high. Dr. Wall in Carrick had acted for £2 2s.

Mr. Richardson said the committee were satisfied to pay £3 3s. per week. The board should remember that the situation was only temporary.

The Chairman considered it would be sufficient to pay £2 2s., which would be about equal to the pay of the permanent medical officer. If the latter thought that sum too small a remuneration for his substitute, he could supplement it himself.

The board expressed an opinion that the proposed fee should be only £2 2s.

BALLYMAHON UNION.

REDUCTION OF SANITARY SALARIES.

MR. O'ROURKE said:—

The Sanitary Act may be necessary for towns and cities that are thickly populated, but in the country where the dwellings and people are much separated the Act is unnecessary and uncalled for; had it been required the way it has been carried out is a mere farce. A few people connected with the union and workhouse have monopolised all the situations accruing from it, some holding several different sources of remuneration at large salaries, to the exclusion of many equally well entitled, who would be glad to get even one. While we cannot repeal or amend the Act, still it is in our power (as guardians) to fix their salaries, which I will endeavour to do as low as I can, owing to the destitution I daily witness of the poorrate payers, who are obliged to pay those big salaries, which must be got whilst they have the smallest value left. By looking over the accounts, I find that six officers have been paid £706 10s. 5½d. since the Sanitary Act came into force in October 1874, and were this sum now to our credit, what a relief it would be to the poor of our union. Finally, I ask my brother guardians who have much more experience than I could be expected to have, to join me for the sake of their constituents, as well as their own interest, to put a final stop to such a state of affairs.

1. Mr. O'Rourke proposed that the office of consulting sanitary officer be abolished, seconded by Mr. O'Brien.

A long discussion ensued, in which several of the guardians took part, after which a vote being taken, there were nine for, and nine against, the votes being equal, the motion was lost; the chairman did not vote.

2. That the salaries of the sanitary and executive officers be reduced one-half. A vote being taken, it had the same effect.

3. That the salaries of the sub-sanitary officers be reduced to one-third the sum now paid them. A vote being taken, the motion was lost.

THOMASTON UNION.

UPON consideration of Mr. Blake's notice of motion that the salaries of the sanitary officers of the union be reduced, read a letter received from Dr. Johnstone, medical officer of the Inistioge dispensary district.

"SIR,—Having read Mr. Blake's proposed motion respecting the reduction of the salaries of the sanitary officers of the union, and the statement he made of there being no sanitary work to be done, I beg to inform you that there is more now to be done than ever, and more real work is done by me, although I have not reported a sanitary case for some time past, except it was reported to me by the sanitary sub-officer or any other person. I conscientiously discharge my duties, which are by no means pleasant or small, often by house to house inspection; and always when I see a nuisance to be abated I have done it by pressing the matter on the party. I find it saves time and a great deal of ill-feeling to do so. For instance, if I inspect a house, say on Saturday, and go through the regular routine of reporting the case to the board of guardians, which would not meet till the following Friday, then two or three more days would be lost before the nuisance would be abated. I am glad to say that the people of my district, in general, are anxious to do what is right in all sanitary matters, when properly spoken to; and I flatter myself that my work has improved the health of my district. Therefore, I respectfully protest against any reduction of my salary as medical officer of health.—I remain, sir, your obedient servant,

"C. A. JOHNSTONE."

Mr. MacCartan next read a rather lengthy statement drawn up by himself, enumerating the various duties performed by him under the Sanitary Act, with the view of showing that his salary as executive sanitary officer of the union admitted of no reduction.

The chairman then called upon Mr. Blake to proceed with the motion of which he had given previous notice.

Mr. Blake—Mr. Chairman, I consider the salaries paid under the Sanitary Act very badly spent indeed. The

Digitized by Google

history of the Act is a very short one. It was originally passed with the ostensible object of bettering the sanitary condition of the poor, but really to increase the salaries of shamefully underpaid dispensary doctors. However, as a Sanitary Act pure and simple, it has lamentably failed, and we are just as dirty as ever (a laugh). Week after week passes here, and the sanitary business is *nil*. I therefore beg to propose that the salaries of the sanitary officers be reduced by thirty per cent. I have always referred to the minute-book. Now, what do I find by it? From the month of July to the month of October, 1878, there were no sanitary reports made to this board; from April of this year to June last there were no reports, but it is a very remarkable fact that, when I gave notice of my intention to bring forward this motion, quite a large crop of sanitary reports have been sent in to this board.

Mr. R. R. Burtchaell, J.P.—I feel it my duty to second Mr. Blake's proposition, but I must say that in my opinion it is not the fault of the sanitary officers that more work has not been done under the Act. It is rather because the Act itself has failed to work. I have much pleasure in seconding Mr. Blake's proposition — not pleasure, indeed, because it is not a pleasure to me to second a motion for the reduction of any man's salary, but I have felt it my duty to second this motion. As the Chairman has said, the medical officers of unions in Ireland are shamefully underpaid. For those reasons principally, I believe, the Sanitary Act was passed in order to supplement the salaries of medical officers. It was thrown out here on a former occasion that sanitary cases were intermittent. I do not think so at all. I rather think they are chronic, and that there is plenty of sanitary work yet to be done, and it ought to be done. The relieving officers, in my opinion, are the people to blame for not having more sanitary work done and brought under the notice of this board, and that being so, I do not think that such a sweeping reduction as that now proposed should be made in the salaries of the sanitary officers of this union.

Mr. Blake's motion was passed *nem. con.*

At a subsequent meeting the following was read :—

Local Government Board,
Dublin, 3rd July, 1879.

Sir,—The Local Government Board for Ireland acknowledge the receipt of minutes of proceedings of the board of guardians of Thomastown Union on the 27th ult., containing a resolution that the salaries of the several sanitary officers of the union be reduced by 30 per cent; and in reference thereto the Local Government Board desire to state that they do not find that any reasons are given for the reduction of the sanitary salaries, which appear to them to be only fair and reasonable remuneration for a satisfactory discharge of the duties of the several officers, and the Local Government Board must therefore decline to entertain the present proposal.

By order of the Board,
W. D. Wodsworth, Assistant Secretary.

Chairman—I thought the Local Government Board would not sanction the proposed reduction, and I said so last board day.

Mr. Hamilton—I think the remuneration paid to sanitary officers is too high for the duties they have discharged, but there can be no doubt whatever but that the medical officers of unions are under paid.

Chairman—And the real object of the Sanitary Act was to supplement the salaries of medical officers.

Mr. O'Donnell—I was one of the guardians who fixed the salaries of the sanitary officers, but at the time those salaries were fixed the country was in a more prosperous condition than it is now. However, there is no work done for the salaries we pay.

Chairman—I think the relieving officers are to blame for not being more active. There can be no doubt whatever but that there is plenty of sanitary work to be done in the country, and the relieving officers should be instructed to be more active and energetic in bringing nuisances, wherever they may be found to exist, under the notice of the board.

The subject was then allowed to drop.

CORRESPONDENCE.

PAYMENT OF SUBSTITUTES FOR DISPENSARY DOCTORS.

TO THE EDITOR OF THE IRISH TIMES.

Sir,—I avail myself of the opportunity afforded by your editorial observations upon the action of the Waterford Guardians towards their medical officers—they having resolved never to pay the *locum tenens* for any of their dispensary medical officers who might become incapacitated from duty by ill-health. I am surprised to observe how unacquainted are both the guardians and the doctors as to the law and rule of this matter, especially as it was sometime since distinctly set forth in a circular issued by the Irish Medical Association. The 22nd article of the dispensary regulations is in abstract as follows :—"If a Medical Officer be temporarily incapacitated, by illness or other cause, from performing his duties, he shall immediately communicate with the Hon. Secretary of the Committee, and shall recommend a medical practitioner qualified to perform his duties. A special meeting of the Committee shall be at once called for the purpose of appointing a temporary substitute for the Medical Officer; and the Committee shall report the circumstances to the Guardians, who shall determine the amount of remuneration, if any, to be paid to the temporary substitute." Now it appears that, in case of "illness or other cause," the medical officer has simply to notify his incapacity to his committee, and recommend a qualified *locum tenens*. This done, the guardians have no power whatever to refuse to pay the medical officer, but they may, if they please, refuse to pay the *locum tenens*, and they have done so in many instances. No resolution passed before or after the occasion is of the least validity as debarring the medical officer from his remuneration; but, if the *locum tenens* is unwise enough to trust himself to the honour of the board, it is quite likely that he may be refused any fee whatever. The fact is, that the Dispensary Committee, in most cases could not be brought together for several days, and therefore the sick doctor—anxious that the poor of his district should not be left without medical care—steps outside the regulation, and makes himself morally liable to the *locum tenens* for his fees, and the guardians are not at all above availing themselves of this indiscretion to save the rates and "stick" the doctor. The Council of the Irish Medical Association states the case as follows :—"The practitioner who acts as *locum tenens* should recollect that his acting for the medical officer is irregular until he has had a definite appointment from the responsible officer of the Dispensary Committee, and that he has no claim whatever for remuneration, except on a definite arrangement on the subject with that officer. He should remember also that if he omits to obtain, at the hands of the committee or its responsible officer, a definite appointment and a definite understanding as to payment, he in undertaking the duties does so at his own risk. The Dispensary Medical Officer who complies strictly with the terms of the regulations is entitled, as a matter of right, to receive his salary during the continuance of his illness, and it is not within the power of the Guardians to refuse payment, or to make any deduction from the amount, either for remuneration of the *locum tenens* or for any other purpose."

I beg your permission to place these facts before your readers, in the hope that they may serve to deter Boards of Guardians from accepting the services of a professional man, and afterwards making use of a legal technicality to avoid paying him.—I am, Sir, yours respectfully,

Archibald H. Jacob, M.D., F.R.C.S.I.

THE DIPHTHERIA OUTBREAK OF LAST SPRING IN N.W. LONDON. (a)

By T. MORTON, M.D. Lond., &c.

(*Continued from page* 20.)

If we are really to exclude all such possibilities as these, there remains nothing to fall back upon but some morbid, or at least morbific, condition of the cows themselves, or, which amounts to much the same thing, of their food; which is certainly a hypothesis fitting in better than any other with the facts we have reviewed. The common ownership of the farm and the sheds regulated not only the supplies of food, but also the movements of the stock at both places, and the stock in such a business is constantly being changed. For instance, some of the hay consumed at both places was grown on meadows at Muswell Hill which are subject to irrigation with Hornsey sewage, a fact of which Mr. Power seems to me to have hardly made enough in his report. It is conceivable, though we have no right to assume it, that this might affect the cow's health or the properties of her milk in such a way as to produce disease in the consumer, and cows whose milk was capable, from this or some other cause, of setting up Diphtheria, might very well have been transferred from Muswell Hill to Kilburn to meet the ever-varying exigencies of business. If such a transfer could have been traced it would have been a cardinal fact in the case, but the results of inquiry were negative on this point. Transfers of this kind did occur, but none were remembered or had been recorded.

Under these circumstances Mr. Power very wisely reported to his official superiors to the effect that the diphtheria had certainly been disseminated by means of milk, and that under circumstances which seemed to point to the poison having resided in the milk itself as drawn from the cow, though the evidence attainable was not sufficient to establish this.

The inquiry, in fact, broke down just at the point where such inquiries constantly do and must break down, the point, namely, of contact between cause and effect which has been traced back to it. Mr. Power spent, I believe, a morning or two in witnessing the milking operations at Mr. X's, but a man would need to reside on such premises for a month to become really cognizant of all the ins and outs of practice prevailing there, anyone of which might supply the last link wanting in the chain of evidence.

The track is lost amid a multiplicity of petty details, or there is, very frequently, someone, perhaps some obscure underling conscious of irregularities, whose interest it is that the inquiry should fail, and who is in a position to thwart it by withholding or falsifying information.

Nevertheless, a very considerable advance towards the truth has evidently been made, and the position attained is, as I think you will all admit, fortified in a very remarkable way by the facts of an outbreak which occurred at Weybridge last year, and which, by the courtesy of Mr. Jacob, medical officer of health for Surrey, I am enabled to read to you in anticipation of his report.

"On July 22nd, ten persons living in eight houses in the village were attacked with diphtheritic sore throat, and fresh cases occurred daily in these and in other houses till July 31st, when the epidemic suddenly stopped. During that time about sixty persons (nearly half of whom were adults) living in thirty houses, came under medical treatment for this affection. One of the earliest sufferers was a young man lodging in Baker Street, who was removed to the Workhouse Hospital, where he died. Only one other case terminated fatally. The infected persons were living in all parts of the village, and principally in houses of the better class, most of which had a separate water supply and system of drainage. The only discoverable circumstance, which they had in common, was that they all had their milk from one dairy in the village.

(a) Read before the Harveian Society of London, April 3, 1879.

Digitized by Google

This dairy supplied about 150 households, of which 30 (or 20 per cent.) were attacked, while the remaining 350 families in the parish which were supplied with milk from three or four other sources entirely escaped the disease. This very unequal incidence of the throat affection upon the two groups of consumers, also pointed very strongly to milk infection as the cause of the epidemic. Moreover, among the customers of this dairy there were eleven families at that time which had stipulated for a supply of milk every day from the same cow. To meet their requirements, the milk of two or three particular cows was set aside and distributed separately under the name of nursery milk; the surplus, if any, of such milk, being added each day to the bulk of the supply. Out of these 11 families, 9 (or nearly 82 per cent.) were attacked with the sore throat, while of the remaining 139 families which drank the rest of the milk from this dairy, 21 (or only 15 per cent.) were attacked. There was, therefore, a special incidence of the affection upon the consumers of the nursery milk—a circumstance favouring the idea that this portion of the milk had especially, if not solely, acquired infective properties, and that the admixture of the surplus of it with the general mass of the milk, explained the illness of those who did not stipulate for nursery milk.

"Among those who suffered from the throat illness, were the dairyman, his female servant, the wife of his cowman, and one of the milk-carriers, the young man who lodged in Baker Street with the cowman. The illness of the milk-carrier commenced on July 22nd, and ended fatally at the Workhouse as already stated. The other three cases began on the 24th, and were extremely slight. Careful inquiry failed to elicit that any case of sore throat had occurred among those employed at the dairy, or in any of their families prior to July 22nd, when the disease appeared suddenly in eight houses. Neither could it be shown that the houses to which the milk had been distributed by this particular carrier had especially suffered.

"The water in use at the dairy was derived from a well on the premises, and was found to be much contaminated with sewage matters. There was no evidence that the specific poison of diphtheria could have got into the well before the outbreak, and no suspicion that any of the impure water had been added to the milk.

"In the yard at the back of the premises, where the milk cans were cleaned and left to drain, was an untrapped inlet to the house-drain, and in the floor of the dairy was a gulley leading to an unventilated drain.

"On July 28th, the cows were all examined by a veterinary surgeon, and pronounced to be in excellent health; none of them had been recently purchased, and no change had been made in their food. In the meadow, however, where they fed, was a pool of water which received some of the sewage of the village.

"The result of my inquiry into the causes of this epidemic, may be briefly stated as follows:—It was due to milk-pollution, but there was not sufficient evidence to justify any conclusion as to the nature and origin of the pollution."

Mr. Jacob writes me that he has traced to the agency of milk two other outbreaks of diphtheria, one at Sutton, and the other at Leatherhead. Of the latter I have no particulars. The former, which occurred in 1877, deserves notice as being the earliest recorded account of such an occurrence, though it required the events of last year to draw due attention to it. The facts are as follows:—

"Between the 14th and 16th of June, fifteen persons living in eleven houses were attacked with diphtheritic sore throats. The houses were in all parts of the town, and ten of them were of considerable size. Nearly all had good sanitary arrangements. All of them were supplied with milk from one dairy, and this circumstance naturally excited some suspicion that unwholesome milk might be the cause of the outbreak. I, therefore, visited the dairy, but did not learn anything there which threw light on the question. Its water supply was good, the cows were healthy, and had had no change of food lately, no cows had been recently added to the stock, and no extra milk purchased from other dairies. The dairyman, his servants, and their families were, and had long been, all well. It may be added that there were five or six other milk supplies to the town, and that the number of families attacked in this instance was about one-tenth of the dairyman's customers."

The circumstances connected with the nursery milk in the Weybridge outbreak are extremely suggestive of some affection of an individual cow as underlying the outbreak, and many of you are aware that Mr. Power, in a paper read before the Pathological Society, has gone a step further still, and raised the question whether the affection, which clearly must be something not evidently interfering with the general health of the animal, may not reside in the milk-secreting apparatus, and be one of several mammary disorders included by farmers under the name of "garget," one of which there seems already some reason to believe, is capable of being propagated from cow to cow as if of a specific nature.

The whole matter is now in the hands of a Committee of the Pathological Society, so that we may confidently expect more light in time.

For myself, I confess I have great difficulty in accepting the garget theory. Since the publication of Mr. Power's report, a German gentleman residing at Lübeck, has written to him to say that he himself has for ten years been convinced, from his own observation, that diphtheria arises from drinking the milk of cows suffering from what he terms "perlspeck" disease, which, judging from his account of the symptoms, would seem to correspond to miliary tubercle. He appears, however, not to be a scientific man, but a former chemist now engaged in farming, and I doubt if much weight should attach to his opinion.

I was myself struck by the fact that both at Sutton and at Weybridge there seems to have been a family affected by diphtheria—which did not then spread—about three months before the outbreak; and it would certainly seem easier to reconcile what we already know of diphtheria as a human disease, with our newly acquired knowledge of its liability to be conveyed by milk, if we suppose that its germs, infesting the cow's food or drink through the medium of sewage, are capable of passing through her system in a form which does not destroy their activity, than that they are being constantly manufactured *de novo* in the udder.

At all events we should be wrong to allow our new knowledge to blind us to the importance of what I still believe to be the regular and most common mode by which diphtheria is constantly kept alive in our midst. I mean direct infection from case to case. Our knowledge of this is about the most certain thing we have got in the etiology of diphtheria, but it needs working out more completely. The most conflicting statements are current as to the conditions under which it is infectious. The incubation period is pretty well made out, though not to the satisfaction of everybody; but we dare not affirm with any confidence that infection may or may not hang about the room, the attendants, or the clothes, points which affect materially many practical questions of prophylaxis. It cannot be doubted that our knowledge with regard to milk explains many instances of the defeat of elaborate precautions, and so strengthens the view, to which I confess I am inclined, that the poison of diphtheria is very inapt to be conveyed by formites.

There is no infectious disease so uncertain in its activity, and my own belief is that the two great sources of difficulty in tracing the fresh case to the parent one are the very various degrees of severity with which diphtheria occurs, and the no less various degrees of susceptibility of different persons to the poison. I think, in fact, that the very mild cases, of which little or no notice is taken, are frequently the parents of well-marked ones. The common English grasses and weeds, as you find them sometimes on the top of some thinly-capped and wind-swept cliff, are so stunted that you hardly recognise them, but transplanted

Digitized by Google

to some moist and sheltered spot they may give rise to a luxuriant vegetation. The common endemic diarrhœa of this country is said, I believe on good authority, to have been much more fatal in this country since the first visitation of cholera, and cases of diarrhœa are exceptionally met with, in years when there is no suspicion of the presence of Asiatic cholera, which are fatal with symptoms that cannot be distinguished from those of cholera.

I do not know whether our indigenous catarrhs acquired any additional virulence after the visits of their formidable congener, influenza, about forty years ago; but you will understand that what I wish to suggest is that diphtheria, cholera, and influenza, may be specifically the same with some much slighter indigenous complaints, but have acquired elsewhere in some more congenial soil a luxuriance constituting them new, and what florists call "giant," varieties; which, however, merge again sooner or later in the native variety. If this could be established it would go far to clear up one, and not the least important, of the interesting questions concerning the essential nature of diphtheria and its relation to other diseases.

(To be continued.)

ARSENIC AND ARSENICAL DOMESTIC POISONING.

By JABEZ HOGG,

Consulting Surgeon to the Royal Westminister Ophthalmic Hospital, and the North-West Hospital for Women and Children.

NEARLY a quarter of a century ago public attention was earnestly directed to a subtle form of domestic arsenical poisoning, which, at that time, was believed to be on the increase. Looked at as a question of public hygiene, the extensive use of arsenical pigments cannot be too severely condemned. The persistent use of arsenical pigments has naturally produced considerable anxiety, especially so, since it has become known that a variety of articles administering to the material comforts of life, inclusive of many varieties of wall-papers, chintzs, silks, muslins, ribbons, stockings, gloves, artificial flowers, American cloths, lamp shades, candles, playing and trade cards, ornamental boxes and wrappers, children's toys, and even sweetmeats, that first attract the eye on entering the shop of the draper, the stationer, the perfumer, the chemist, the grocer, the toy-dealer, the sweetmeat seller, &c., are the means by which deleterious articles of a seductive appearance are disseminated and brought into our homes.

The almost universal use of poisonous pigments in the arts and manufactures is known to be productive of a two-fold noxious influence; first, upon the work-people employed in their manufacture; and secondly, on a very much larger number of persons who purchase them, and who, being quite ignorant of their nature, adorn and surround themselves and their homes with the elements of disease. If in 1875 it appeared just and right of the Legislature of the country to enact that the sale of adulterated articles of food and drinks should be made a penal offence, it is certainly of equal importance to the community at large that similar restrictions should be placed upon the manufacture and sale of goods impregnated with a dangerous poisonous material.

Notwithstanding the humane efforts of men of science, chemists, and physicians, nothing whatever has been done by Parliament to lessen the evil, and spare the infliction of disease and death upon innocent people. It is now many years since the Prussian Government set an example, which, I think, it would have been wise of our Government to follow. It forbade the sale of all articles coloured with arsenical pigments. In France the manufacture and sale of arsenical wall-papers is also wholly prohibited. In Bavaria, the country of the celebrated Liebig, an edict was passed in 1845 prohibiting the manufacture and sale of arsenical pigments. A year or two afterwards, and at the instigation of manufacturers who declared that the enactment was injuring trade, some relaxation took place, but this soon led to greater abuses. Professor Hoffman, who was ordered to make inquiries into them, reported that he had met with a great many cases of chronic poisoning from wall papers, even when they were glazed. Upon this the Government reverted to its original edict, and at once ordered the removal of all Schweinfurt green papers, paints and distemper colours from the walls of public buildings, schools, hospitals, &c.

The increasing danger of arsenical poisoning was directly brought under the notice of a select committee of the House of Lords in 1857, at the time the Sale of Poisons Bill was framed. Irrefragable evidence was educed by Prof. Dr. Alfred Taylor and other chemists of eminence, of the danger to health from the use of arsenic in various manufactures, but to very little purpose, for when the Act to regulate the sale of arsenic became law, it was seen that whilst it placed restrictions on the sale of this poison in small quantities, it opened the door wide enough to the wholesale purchaser, and it is now the boast of the wall-paper manufacturer that he uses tons of arsenic per week. It is said that if the Act of 1857 were put in force against the wholesale buyer, the trade would be injured—that to prohibit the use of arsenic would involve many of them in difficulties; but these difficulties, whatever they may be, should not be allowed to stand in way of the public health. Besides, evidence is not wanting that harmless pigments of proved utility and durability are already prepared to replace arsenical colours, and a firm, Messrs. Cooke, of Leeds, I am aware, take every precaution to prevent the slightest introduction of arsenic into their factory, buying all colours used in printing with a guarantee that they are perfectly free from arsenic. Such firms as Messrs. Cooke's are, I believe, quite ready to co-operate with those members of the profession who, being thoroughly conversant with the extent of the evil, desire to see restriction placed upon the employment of arsenical pigments in every shape.

In treating of arsenical poisoning, it might appear necessary to inquire first into the action of arsenic as a remedy, and in what particulars the symptoms of poisoning as produced by an overdose differ from those observed in wall-paper poisoning. Secondly, whether any greater activity or virulency of the poison is the result of the inhalation of the arsenical dust; if so, whether this is chiefly due to the form in which the poison is presented and absorbed:—*a.* As finely divided crystalline particles. *b.* As evolved arseniuretted hydrogen gas; or *c.* As the combined action of dust and gaseous matter.

The Remedial Action of Arsenic.—Arsenic has long been regarded as one of the most remarkable therapeutical mineral substances. It has not inaptly been described as a poison in health, and a remedy in disease. Although this description may be regarded as a somewhat curious anomaly, it is nevertheless perfectly true. Nearly all the compounds of arsenic are actively poisonous, the trioxide, which is very extensively employed, being the most active. On the other hand, the compounds of arsenic have long been regarded as valuable remedies. As a medicine, arsenic exerts a certain controlling power over morbid actions, and its curative nature may be accepted as of three kinds. First, it is a potent antiperiodic, a very useful one, in ague, in chorea, and in epilepsy. Secondly, it is a nervine tonic of value in the intermittent forms of neuralgia and gastrodynia. In larger doses it has another action, that of a blood poison, or nerve disturber, as seen in its partial arrest of nutrition, and in the production of various local disorders, skin affections.

In the treatment of ague it was at one time believed to possess advantages over quinia, as it may be given with perfect safety during a paroxysm; and should the cinchona cultivation fail us, it is not at all unlikely that arsenic may once more become the fashionable remedy it was in our forefathers' days, and again find favour as a "Tasteless Ague-drop."

In intermittent neuralgia and gastrodynia, arsenic acts

Digitized by Google

as a nervine, or, more properly, a nervine tonic, for it soothes pain, promotes assimilation and secretion, and thus improves the appetite. In some instances it excites both the nervous and muscular functions of the stomach, and thereby digestion is materially invigorated. In intermittent neuralgia, nerve debility, it is beneficial. In this affection its peculiarity is noticed. Although an active poison, it exercises a decidedly antagonistic action, a controlling agency, over other poisons, as in intermittent fever and convulsive disease. It is, nevertheless, an agent quite foreign to the blood, and if no attempt be made to eliminate it from the circulation, it becomes a poisonous irritant, and by a rough and ready method of its own, works its way out of the body. If not carefully watched, it will produce nerve disturbances, inflammation of the skin, headache, dermitites, giddiness, lassitude, shifting pains, and impaired sensibility of the extremities. It certainly exerts a specific action over the heart and other vital organs, as the lungs and salivary glands, as evinced by the local pains, the irritative cough, and the occasional ptyalism.

Dr. Darwin, the father of the present eminent philosopher, was probably the first to notice the specific action of arsenic over the nervous system and heart. He administered a saturated solution of arsenious acid in a case of heart disease with surprising effect. Full doses of the more soluble preparations of arsenic produce retardation of the heart's action, an effect said to be due to paralysis of the motor ganglia, or rather to a limiting action of the remedy, which renders the muscular tissue of the heart less irritable. From nerve disturbance and interruption of nutrition, we have certain cutaneous diseases, termed generally by Dr. G. Kichgassen *arsenicum*; by Mr. Hunt, *pityriasis arsenicalis*, herpes, eczema, and conjunctivitis.

In the treatment of the true squamous or tubercular type of skin diseases, arsenic is undoubtedly a valuable remedy. In lepra vulgaris, psoriasis, and in other forms of disease nearly allied, impetigo, porrigo, &c., it is given with benefit. In lepra, unassociated by a syphilitic taint, arsenic exerts "an almost omnipotent influence" (Hunt). If in the hands of some practitioners it fails to be of use, this arises from one of the following causes:—1st, overlooking the syphilitic complication; or 2nd, the administration of the remedy during the inflammatory or febrile stage; or 3rd, forgetting that it should not be given on an empty stomach; or or lastly, prescribing it in too large doses, and long intervals (Hunt). From not observing one or other of these practical rules, arsenic has acquired the reputation of being a cumulative poison. It is found, however, that the danger of accumulation may be entirely obviated if a watch is kept over the mucous membranes. The outer coat of the eye is an unfailing guide, as in ninety-eight cases out of a hundred an increase in the vessels of the conjunctiva takes place, and the irritation, "hot-eye," warns us that it is time to suspend the remedy. The arsenical conjunctivitis thus induced is usually of a mild character, and quickly subsides when the remedy is suspended. The affection is unaccompanied with any great amount of general disturbance; is, in short, a trivial nature. Arsenic applied externally, as a paste or salve, is a powerful irritant. It is also an escharotic; one that quickly destroys the skin. Its caustic action led to a belief that it would prove a specific for cancer and lupus; but from its destructive nature it fell into disrepute, and was abandoned in the treatment of these diseases. The remarkable nature of the chemical change induced by arsenical paste on the living tissues, is not perfectly understood, and, therefore, cannot be explained. Arsenic, if applied as a dry powder to the surface of the skin, is scarcely less caustic in its action. A most painful example of this fact occurred not long ago at Stoke Newington, where no less than thirteen infants were most cruelly sacrificed to the culpable greed of adulteration. A chemist anxious to undersell his neighbours, put up a mixture of starch, white arsenic, and some other ingredients, and sold the poisonous compound as violet powder. This was merely *dusted* over the skin in quite an ordinary manner, and produced first an eruptive sore, then excessive ulceration, and sloughing of the cuticle, of so severe a nature as to cause death in the course of a few days. A mixture of arsenic, soft-soap, and tar-water, is largely used in agricultural districts for killing tick in sheep, and has been known to cause death in some instances, the animals dying from the usual symptoms of acute arsenical poisoning. A mixture of arsenite of potash, is also a good deal used by farmers; of a no less dangerous nature, even to sheep, unless very carefully used (Taylor).

The action of arsenic, however, like that of other drugs, is variable; but the extreme susceptability, idiosyncracy, exhibited by some persons to its toxic qualities, is quite as remarkable as is the perfect indifference to large doses shown by others. As an instance of indifference to its action, I may point to the people of Upper Styria, who regard it with feelings somewhat akin to the tobacco-smoker or chewer. These people believe that it increases strength, enables them to carry heavy loads with less fatigue. Professor Roscoe took some trouble to verify the statements made with regard to arsenic-eating. A woodcutter, he tells us, was seen by a member of our profession to eat a piece of crude arsenic weighing upwards of four grains. Another ate a piece much larger. Arsenic is given to horses in considerable quantities, and is believed to increase the appetite and the activity of the older and feebler animals. Grooms give it largely for other purposes; as that of improving the coat of the horse, and as a remedy in skin disease. This was the use Mr. Bravo's groom was said to make of arsenic found in his possession at the time of his master's tragical death.

There are, however, only a very few cases on record in which the medicinal preparations of arsenic have been known to destroy life. A case was published some years ago, of a woman who took half an ounce of Fowler's solution of arsenic, and died from its effects. There was no vomiting or purging, and in this particular the symptoms differed from those of the following extraordinary case of poisoning by arsenic lately reported to have occurred at Huddersfield. A woman, who had been in the habit of taking prepared chalk to relieve heartburn, was attacked after taking a dose, with sickness and abdominal pains, which were not relieved by the administration of remedies. In five days the woman died, and a post-mortem examination revealed the fact of arsenical poisoning. It was then discovered that the powder sold by the druggist was "French chalk," in mistake for prepared chalk; and that this French chalk contained as much as 40 per cent. of arsenic.

Clinical Records.

MEATH HOSPITAL AND CO. DUBLIN INFIRMARY.

Brief Notes of Cases of Operation.

Under the care of Mr. LAMBERT H. ORMSBY, F.R.C.S.

(Notes taken by Mr. JOHN F. MULLEN, Resident Pupil.)

CASE 1.—*Removal of Two Large Sequestra from Right Tibia.*

The patient in this case, John G., living in a country district, gives a history dating back eight years, and blames a kick received while playing football for his subsequent ill health, and almost useless limb. He got the kick in front, about six inches above the instep, and the first indications of serious consequence was a stiffness about the ankle-joint. The stiffness getting worse, and being accompanied with pain, he consulted a quack, who

Digitized by Google

used, the patient says, strong liniments, and when the part became denuded some strong caustic, applied by a feather, to burn away any flesh the appearance of which he considered unhealthy. Three years having elapsed, and his health rapidly failing, the patient called in a qualified practitioner, who found him lying in bed and greatly debilitated. Under careful treatment he slowly recovered his health to some extent, and at the end of three months was again able to leave his bed. In the meantime, his legs became greatly swollen, poultices being constantly applied to the affected limb. When the swelling subsided, the patient himself noticed a great enlargement of bone in the hurt leg. A piece of bone first came away, two years after the injury, and according to the patient's estimation, more than fifty pieces of bone, some being, in size and shape, like a large pea, but rough on the surface, others scaly, and varying in size from a small fish bone to pieces three and four inches long, and half an inch in breadth. Of the large sized bones only four or five came away. The bones came from the internal, anterior, and external surfaces of the limb. Finally, the patient decided on coming to Dublin for advice, and entered hospital on June 2nd of this year.

On examination, Mr. Ormsby found the probe passed fully four inches deep, and easily detected necrosed bone. After some time the patient consented to an operation—his health having greatly improved from the date of his admission into hospital.

Operation performed on July 9th.—The patient was anæsthetised by ether, the operator's inhaler, made by Coxeter, London, being used. Esmarch's bandage being applied, a vertical incision was made on the antero-external aspect of the limb at the junction of its upper and middle thirds, over the seat of the sequestra. On cutting down upon the diseased part and following the cloacæ, an irregular, elongated piece of bone was easily extracted, although lying at some considerable distance from the surface, but owing to the vascularity of the greatly enlarged tibia and degenerated bone tissue, and from the fact that the Esmarch was powerless to control by pressure the flow of blood seated in the hard tissue, the blood freely welled up, and increased the difficulty of exploring the cavity. However, after some time and patient examination, a second piece of bone was found nearer the surface, and situate towards the upper end of the incision. This portion of bone being skilfully extracted, and the hæmorrhage controlled by lint, and a bandage applied round the limb, from the toes to some distance above the incision—the operation was complete. The patient appears to have suffered but little from the shock of the operation, and at present is progressing favourably.

CASE 2.—*Removal of a Sequestrum from the Tibia of a Healthy Boy, æt.* 8.

In this operation the same anæsthetic was used, which seemed to please, rather than disturb, the patient. An incision was made, about three inches in length, in the axis of the limb, and the sequestrum being in the hard peripheral bone-tissue very little difficulty was experienced in the removal of the necrosed bone. But on removal of the sequestrum the bone beneath was found to be quite soft, so much so, that it could be scraped away by the finger nail of the operator. It was forcibly pointed out by Mr. L. H. Ormsby how necessary it was to preserve the periosteum with its osteo-genetic layer, to ensure the laying down of bone to repair the loss. In this operation very little blood was lost, and it was completed by simple dressing, and a bandage applied from the toes to some distance above the upper end of the incision.

CASE 3.—*Circumcision in a Case of Phymosis, with Chancre.*

The patient, a strong, healthy man, was put under ether as in the other cases, Ricord's forceps was used, and it was plainly demonstrated how much quicker the operation of circumcision may be completed by the aid of this instrument, than by the ordinary method. The operator, Mr. Ormsby, showed how, by a single passage of the needle a double stitch was made, and in the absence of any anæsthetic, the patient was saved a good deal of unnecessary pain. In raising the ligatures after the prepuce was detached, the necessity of keeping in the middle line to catch them up, by means of a hook, was clearly pointed out, whereas, by going slightly to either side the mucous membrane only might be caught up. The hæmorrhage was but slight, and simple dressing sufficed to complete the operation.

CASE 4.—*Removal of Exostosis.*

This was an operation for exostosis growing on the inferior surface of the os calcis, deeply seated beneath the long plantar ligament, close to its origin. The history of this case is peculiar and interesting. The patient, L. B., a young girl, æt. 18, on the morning of Sept. 3, 1878, the house in which she slept being on fire, in the town of Ennis, co. Clare, and all other means of escape being cut off, jumped from a window, forty feet high, into the street. She was taken up insensible, and carried to hospital in the town in which the accident occurred, and remained there for some months, her recovery being pretty slow. So far as the patient recollects, during the first fortnight of her being confined to her bed, she was continually screaming, and she is not aware of any bones being broken. Of two other females who, to save themselves from being burned, jumped the same height, one, æt. 60, was killed instantaneously, and the other, a young girl, having been placed in hospital, slowly but permanently recovered. The patient herself first felt the bone in hospital, a month or so before she left. On going to her friends she could only walk by leaning on a companion, or by the aid of a stick, and would feel great pain if pressure were brought to bear over the seat of exostosis. The patient being desirous of improving her condition, gained admission into the Meath Hospital, on June 17th. On digital examination, Mr. Ormsby found a prominence beneath the soft tissues, on the under surface of the os calcis; the patient consented to have it removed.

Operation performed on July 9th.—The anæsthetic used in this case was the bichloride of methylene, kindly administered by Mr. Macnamara, in the most satisfactory manner. On making an incision through the soft tissues, in the axis of the foot, the exostosis was reached, and found to be growing directly from the calcaneum beneath the long plantar ligament, close to its origin. The periosteum being carefully preserved as far as possible, the exostosis was removed with a chisel and gouge, and its place of origin scraped and smoothed so as to remove any remains of the growth. There was but little blood, and the operation was completed with simple dressing.

Mr. Ormsby then drew attention to the nature, origin, and causes of exostosis. The one removed was very hard, approaching in compactness to the ivory form of exostosis. He also said that it was most remarkable that a girl could fall a distance of over 40 feet into the street, without sustaining any further injury.

Department of Lunacy.

PSYCHOLOGICAL LITERATURE.—III.

Ninth Report of the Stirling District Lunacy Board.—This report dates from 15th February, 1878, to 15th February, 1879; on 15th February, 1878, there were 290 patients, of whom 135 were males, and 155 females. During the year 121 were admitted—the greatest number of the admissions being in the months June and July, and the smallest in September. There are 111 discharged from the asylum, and out of this number 58 recovered. The average resident during the year was 295, being an increase of 18 over last year. On the cumulative nature

Digitized by Google

of the insanity in the district, Dr. Maclaren, the Medical Superintendent, says, it "is a matter of grave interest to all concerned. I am not well enough acquainted with the history and circumstances of each parish to discuss the question of how much of it springs from actual increase of lunacy, and how much from other causes, which lead to asylum accommodation being more taken advantage of than formerly. Whatever theory may be adopted, the plain fact remains that our admissions now as compared with the early years of the Asylum are growing steadily larger. This increase, too, is not in any way fitful or apparently due to any one kind of insanity preponderating over another. There are simply more cases of all kinds, and there is nothing whatever in their nature or history to point them out as in any way exceptional, or of a kind that may not be constantly occurring in the district. Neither is there any reason for hoping that the flow has reached its full height.

We give with the greatest pleasure, *in extenso*, remarks made on the cause of insanity, as being of interest to those engaged in the treatment of the insane.

"In going into the cause of insanity, among the admissions, intemperance and intemperate excesses meet one in a proportion far exceeding any other one cause or series of causes. In fact, the more one studies individual cases closely, the more is one struck with the fact of what a preventible disease insanity might frequently be were certain laws of mental health more generally known, or when known, more generally observed. In many cases, as one traces step after step in the downward career, it is impossible not to see how easily mental health might have been regained at a certain stage had some special undermining indulgence been stopped, or some particular course of life avoided; and were people but as careful of their brains as they are of most of their other organs, there seems no reason why much of this might not be done. The same remark applies to all other classes of cases. Were, for instance, toiling literary men, or men of business, but to realise that the pains in the head, the confusion of ideas, and partial loss of memory, and other similar symptoms which follow upon overwork, are as sure evidences of approaching brain disease as would pain in the chest, and cough after exposure to cold, be of an attack of some form of lung complaint, they would surely be as careful to avoid further work and worry, and to take the necessary rest, as they would in the other instance to refrain from going out of doors unless well wrapped up, or doing anything that could aggravate the threatened mischief. It is to be regretted that some of the more simple laws of mental health are not inculcated on the people with their earliest education, so that they might realise that certain bad results will inevitably follow certain breaches of them. Even the most ignorant know that sitting with wet feet, or leaving a hot room suddenly, will almost certainly bring on a dangerous cold. How few know, and still fewer remember, that any tampering with the more delicate organ will inevitably be followed by even more dread results. And yet many of the laws of mental health are as obvious to common sense, and nearly as easily followed, as those which govern our material well being."

The Report is worthy of careful study, contains well drawn up statistical tables, and is written in a very clear manner by its able superintendent, Dr. Maclaren.

The friends in Dublin of Staff-Surgeon Longfield, of H.M.S. *Tenedos*, will be glad to see that his gallantry and services at the action of Ginghilevo have not been unrecognised by the authorities. Last Friday's *Gazette* announced that Staff-Surgeon Longfield, who was severely wounded at Ginghilevo, has been promoted to the rank of Fleet-Surgeon.

THE GENERAL MEDICAL COUNCIL.

The first sitting of the General Medical Council was held on Thursday, July 17th, at two o'clock, p.m., the President, Dr. H. W. Acland, F.R.S., in the chair. The minutes of the last meeting having been confirmed, the President delivered the following address;—

THE PRESIDENT'S ADDRESS.

The President said—The Council has been necessarily summoned at this time, since to-morrow my term of office will expire. Several other matters require your attention. Returns from some of the licensing bodies will be laid before you in answer to your inquiries made in March last concerning the study of ophthalmology and of gynæcology, including obstetrics. These returns, together with some other papers, notably a communication from the Branch Council of Ireland, and a resolution to be proposed to you concerning preliminary education, will tend to raise again the whole subject of the duration and manner of medical teaching in all departments. Many who took part in the former discussions on this subject are not with us. Brodie, Stokes, Green, Syme, Lawrence, Parkes, Rumsey, all gone—Quain (the surgeon), Allen Thompson, Lister, Cæsar Hawkins, George Paget, Sharpey, Embleton, yet with us, and several others who were prominent in the older elaborate discussions on education, cannot now state their views in Council. It will not then be surprising if the present members of Council should desire, at this or an early opportunity, to consider what has been the result of the recommendations, which occupied the attention of the Council for so many years up to the present time. Various correspondence regarding colonial and foreign practitioners will remind you how urgent it is that the Government should come to a conclusion with reference to this subject, already delayed ten years. The letters and reports from the Governor-General and the Privy Council of Canada, and one from the University of Adelaide, demand especial attention. A person convicted ten years ago of a grave misdemeanour and removed from the Register seeks to have his offence condoned and to be replaced. The case of one now on the Register, but expelled from the licensing bodies to which he is attached for circumstances of the gravest character, will come before you for judgment. This induces me to say here that, though some exceptions are still made to the general in its relation to the local register, we are assured by the registrar that the various errors which had crept in some years ago are wholly corrected and removed. The Dentists' Register comes into operation in August. A list of various minor registers, showing that part of the present work of the office, will be submitted to you. [After a brief allusion to the sittings of the Select Committee of the House of Commons, the President continued:—] A question has been much discussed whether the Council should exercise direct and absolute control over the details of the general, scientific, and practical education, as far as regards medicine, in all the universities and all the medical corporations and schools in the country. This question is often too lightly put and too hastily answered. We may take a single instance. Thinking men are not even now decided whether the average general practitioners—that is, by far the largest number of the profession—will best begin their difficult studies with a private practitioner or in a complete medical school. May not both both ways be good! Is not contact with the daily life of a skilful upright man a discipline of itself, in some respects the best a student can have? Yet is there not a risk of his falling into the hands of one neither skilful nor upright, and of acquiring low views of his profession for life? And with regard to so-called medical schools, is the standard and tone of all (metropolitan or provincial) on at all the same level of culture, of science, and of practice? Are we under these circumstances to seek to force the several methods of preparation and of study into one precise groove? or shall we allow and even encourage that diversity which is promoted by freedom, by opportunity, by national taste, and even personal interest, so long as it stands the supreme test of a good final examination of fitness in respect "of the knowledge and skill requisite for the practice of the profession?" I am well aware that these plain and often reiterated questions may appear to some persons outside the responsibility of the Council too commonplace for calm inquiry and careful decision. Some would settle them at once by a majority of votes, and

Digitized by Google

would impose the verdict of that majority on the leaders of thought, whether in our universities, in our great colleges of surgery and of medicine, or in the great private schools attached to hospitals, Royal or self-supported. But those who have paid attention to the modern changes and the great progress of the science and art of medicine and surgery know full well that general education and medical knowledge are in a state so transitional that they will long require constant watchfulness and care, and much interchange of thought and experience between the teachers and examiners of various schools of this and of other countries. The Reports of the Council on Professional Education in the year 1869, and the Report of the Teachers' Association in the year 1870, and the increasing demand that more time shall be devoted to great and special subjects, such as experimental physiology or ophthalmology, are quite sufficient to prove this. Looking indeed at the subject matter of medical education, at the difficulty, extent, and yearly growth of biological research, at the largeness of the interests of the national health, the extent of preventive and legal medicine, at the problems connected with the natural history of disease, at the vast array of fact in the domain of modern pathology, at the improvement in the means of diagnosis, and of the apparatus of therapeutics, even the knowledge we are obtaining of the need and results of good nursing and training required for it, one cannot but feel that a future of the deepest interest lies before this Council as a great educational institution if only it can be saved for some years to come from the distractions forced upon it from without, such, I mean, as is caused by discussions on the machinery for performing its duties and on the merits of its own constitution, with which clearly it has, as long as it exists, nothing to do, and by which it has been disturbed and hampered in its deliberations for a period as long as the siege of Troy. It would ill become me to trespass on your time with further observations in this direction. In the circumstances under which I address you they will be perhaps thus far pardoned. It has seemed well that we should all be reminded how vital it is for the cause of medical education that the Legislature should pronounce, without further delay, whether there is or is not to be a system of combined examination approved by this Council, or whether each one of the existing licensing bodies is to feel that its present examining board is to be permanently maintained, with the corresponding responsibility of securing by some means a complete pass examination. Every other educational question pales in importance before this, for in the present state of public opinion examinations necessarily guide the average, and to a great extent the higher education. When we look back on the first few years of the existence of the Council, and compare them with the latter years, we cannot fail to be struck with the great advance made towards a complete and comprehensive view of the needs of society in relation to medicine, and of the extent to which special interests are subordinated to national wants. The progress of natural science, the addition to the resources of healing, and the abolition of unnecessary restrictions engage the common thoughts of the medical profession, and a new and constant diversity of suggestion and endeavours maintain among us a vigorous life. The whole profession of the present day, its teachers and examiners, and, indeed, its actual students, are keenly alive to the misfortune which attaches to the instances, happily more and more rare, of men who are able to evade by ingenious contrivances the regulations of the licensing bodies and the recommendations of the Medical Council. Though, in a country like ours, diversity of opinion is sometimes too loudly expressed, yet that very diversity has here, at least, tended to create a harmony of aim and a unity of spirit before unknown, and a genuine desire for the advancement of sound knowledge and beneficent practice in medicine equally throughout the British dominions.

The following committees were then elected :—

Business :—Drs. Andrew Wood (Chairman), Leet, Haldane, Pyle, and Aquilla Smith.

Executive :—Drs. Aquilla Smith (Chairman), Andrew Wood, Quain, Pitman, Humphry, and Mr. Simon.

The Registrar having read the report of the executive committee, this was after a short discussion adopted.

Elementary Education.

Mr. Simon moved that—"The subject of elementary mechanics of solids and fluids, meaning thereby mechanics, hydrostatics, pneumatics, and hydraulics, be no longer recommended by the Council as an optional subject of preliminary education, but be recommended as one of the subjects without a knowledge of which no candidate should be allowed to obtain a qualification entitling him to be registered." A very lively discussion on the point ensued.

The Rev. Dr. Haughton, while agreeing with Mr. Simon that a knowledge of mechanical principles is essential to the student of physiology, and eminently so to the surgeon, regretted to see Greek—a subject he considered equally important—relegated to an inferior rank with mechanics. He deemed the Council to have failed in its duty by neglecting to make Greek a compulsory subject, and thought it ridiculous to expect any man to become acquainted with the elements of mechanics as a science, apart from actual laboratory practice. He ridiculed the introduction of the term *hydraulics* into the motion, and declared the framer of it could have no actual knowledge of the meaning of the word to include it in *elementary* education, since its study involved intimate acquaintance with the higher mathematics. He moved an amendment to the effect that a committee should consider whether Greek ought not to be made a compulsory subject of the preliminary examination, Mr. Macnamara seconding.

Sir Wm. Gull protested against the question being submitted to a committee, and asserted that Dr. Haughton could know nothing of practical physic to give utterance to the sentiment he had; whereupon Dr. Haughton retorted that he knew a "good deal of practical physic," this evoking from Sir Wm. Gull the remark—"Then he knows a good deal more than I do." Continuing, he endorsed Mr. Simon's opinion of the importance of physics in the medical preliminary curriculum, and urged the adoption of his motion.

Dr. Rolleston pointed out that the practical issue is whether the subject shall be introduced *de rigueur* into the first professional examination, and he was strongly of opinion that chemistry and physics with mechanics should have equal recognition therein. For the purpose of securing a good linguistic training he thought two languages sufficient, of which Latin is an essential one. He advocated the appointment of a committee.

Some further remarks having been made by Mr. Turner and Dr. Humphry, Dr. Haughton was willing to withdraw his amendment, since he had not rightly comprehended Mr. Simon's intention. He had feared that a special branch of knowledge had been intended to be favoured by the motion at the expense of other equally important studies, but having the assurance that this was not so he would not press his amendment.

Dr. Fergus desired to see the preliminary education of the student *extended*, but not *diluted*, and would have him left to pass, at his option, the examination which should test his acquaintance with the subjects included in it. He wished to see botany and physics among those subjects, and the general scope of the test widened. He suggested that in place of the costly visitations, each examining body should periodically return to the Council for its consideration the questions set by it, and specimens of the replies given by candidates.

Dr. Pitman and Mr. Teale having spoken on the motion, the President reported the state of business.

Mr. Simon then sought permission to add to his motion—"It being understood that the examination in this branch of knowledge be passed at the option of the candidate" and the motion, thus altered, was carried subsequent to the withdrawal of two amendments, each proposed and seconded by Dr. Rolleston and Dr. Hudson respectively, to the effect that elementary mechanics be made a compulsory part of the first division of the professional examination; and that chemical physics be made compulsory in the same examination. It was resolved to leave to the common sense of the executive committee the omission or alteration of the term "hydraulics," objected to by Dr. Haughton.

Answers from Medical Licensing Bodies.

Dr. Storrar moved that "consideration of the answers of medical licensing bodies to a letter sent to them by the executive committee in regard to the preliminary education and examination of medical students, adjourned from the last meeting of the General Council," be postponed to the next meeting.

Dr. Haughton thought this continual postponement of business a dangerous precedent, but was reminded by Dr. Andrew Wood that the present session was convened for a special purpose, and thought it would be wise to delay till the next session the whole question of medical education.

Digitized by Google

Eventually Dr. Storrar withdrew his motion in favour of a substantive motion from Sir Wm. Gull, seconded by Dr. Rolleston, to the effect that replies from the licensing bodies should be collected and forwarded to the branch Councils in each division of the kingdom. That these should report thereon at the next session of the Council, in order to a full consideration of the whole question then.

Royal College of Surgeons, Ireland.

A long and somewhat animated discussion on certain alleged irregularities on the part of the Royal College of Surgeons of Ireland now ensued, the contention being that the College habitually admits candidates to examination for its licence, who have not passed the prescribed time subsequent to showing evidence of an adequate preliminary education. Sir Wm. Gull believed that the Irish College opened its doors to men unfit to enter the profession; and was met by Mr. Macnamara's assertion that no student is permitted to sit at the professional examination without either passing a satisfactory preliminary test, or adducing proof that he has already done so elsewhere. Sometimes, however, cases arise requiring special adjudication; and on all such cases the College jealously preserved its own right of deciding, refusing to resign into any other hands powers conferred on them by Royal Charter. He defended the action of the College in permitting men to pass the preliminary examination at any period of study.

Dr. Fergus desired to know if any Royal Charter can override the Act of 1858; and also whether the Royal College of Surgeons admits men to its examination who have not been registered forty-five months?

Mr. Macnamara reiterated that no Act of Parliament can exert superiority over a Royal Charter, but the Medical Council, he granted, could, in face of the Royal College of Surgeons refusing to adopt its recommendations, report the delinquent to the Privy Council; but here it ended; for the Privy Council even would not interfere with the rights conferred by Royal Charter on the governing body of the College, who are consequently actually independent of all influence. The College, he added, demanded from candidates for its licence proof of four years' professional study, and pointed out that it required more numerous courses of lectures in anatomy and surgery than are recommended by the General Medical Council.

Mr. Simon considered the College had erred, and the question involved one of vital importance, for the whole efficiency of the General Council entirely depended on the compliance of examining bodies with the recommendations it issued from time to time.

Dr. Haughton believed the offence less serious than appeared at first sight. Licentiates of the Royal College of Surgeons, Ireland, undoubtedly do get forty-five or more months of medical training, the only laxity being as to date of registration. He proceeded to express his contempt for the "cramming" resorted to in the schools and colleges, and averred that he had little faith in the adequacy of the preliminary examination as a test of knowledge.

Mr. Macnamara said the Royal College of Surgeons, Ireland conscientiously rejected the "recommendation" of the Council, on the preliminary examination, believing their duty to their students required such action from them; and further, they considered the Council would accept the rejection in the spirit it was made.

Sir Wm. Gull suggested that the secretary of the Council of the Royal College of Surgeons, Ireland, be communicated with, and a request made that the non-compliance of the College with the recommendation of the General Medical Council be reconsidered.

Mr. Simon having commented on the importance of the question at issue,

Sir Dominic Corrigan agreed with him, and pointed out the anomaly existing at Trinity College, Dublin, where medical students could, he said, claim to be registered on payment of a five-shilling fee, and he would, therefore, include Trinity College in any motion involving the Royal College of Surgeons.

Dr. Haughton replied that an old Act of 1801, the last passed by the Irish Parliament, enacted that a medical student might register *since* examination, on payment of five shillings, but that for sixteen years, and since the recommendation issued by the General Council, no single student had thus matriculated.

Dr. Andrew Wood declared the motion under discussion the most important ever before the Council. They had been twitted with unwillingness to act, but now was their occasion. The glory of the Council was that it had established a preliminary education and a register of medical students. The regulations as to these had been loyally complied with, and now, for the first time, instances of evasion are cropping up. In Scotland exceptional cases are dealt with by branch Council, and he could see no reason for a different course in Ireland. Should the Irish College continue its refusal, the case should go before the Privy Council. If this be not done the General Council would be abdicating its functions.

Some time was occupied in proving to Sir Dominic Corrigan the false impression he laboured under respecting Trinity College, Dublin, and it was shown to him that the matriculation of a student did not mean his registration. Finally, a motion, put by Sir William Gull, to the effect that the Royal College of Surgeons of Ireland be requested to reconsider its action in respect of the recommendation of the General Council concerning the laxity in its admission of candidates for its license, was carried, after the standing order had been suspended. Previously, Mr. Macnamara thanked Sir William Gull for the courteous language in which the motion in his name had been couched, and stated his conviction that the College would accord the clearest consideration to the question.

Second Day, Friday, July 18th.

The minutes of the preceding meeting having been duly passed, there arose a lengthy discussion on

Compulsory Attendance at Lectures.

Mr. Macnamara proposed "that it be the duty of the branch registrars in the several divisions of the kingdom to register, at the commencement of each session, the names of all students, and the hospitals and lectures for which they may have entered; and that it be strongly recommended to each of the licensing bodies not to accept any certificate for attendance on hospitals or lectures, unless such shall be certified to them by the branch registrars as having been duly entered on these registers on or before the last day fixed in each division of the kingdom for the commencement of the session." He said he had much pleasure in introducing the motion after the previous day's experience. He insisted that the Irish Royal College of Surgeons was anxious to make the medical education as complete as possible. Certain differences existed between the practice of that body and the English schools. The session commenced on the 1st of November, though the dissecting rooms were open to students throughout October. In Dublin there are six medical schools, (four private and two public), and in none had any difficulty been experienced in fulfilling all the conditions of registration, &c. Each student who has completed the required attendances on lectures received a certificate to that effect, but much laxity existed in the observance of this particular, not alone in Ireland; and he would venture to say that at some places men had been known to present themselves at lecture early in the session, and subsequently, without any further attendance thereat, duly received certificates of having fulfilled the conditions formally set out in the recommendations of the Council. To suppress this evil he had brought forward the motion in his name.

Dr. Haughton seconded the motion because it went in the direction he desired, but not nearly far enough. At Trinity College, Dublin, he said, no student was admitted to attend the lectures for any session after November 25th, on which date the books were closed to all new entrants.

Dr. Andrew Wood thought that reform should be initiated where the evil is found. The authorities in Ireland ought to secure that the certificates issued by them, and on which other corporations act in perfect good faith, are *bonâ fide* registers of work done. In Scotland, regular attendance on lectures was obtained by means of a regulation which required that in every class a roll should be called twenty-five times (at intervals unknown to students) in a course of six months, and twelve times during a three months course. More than a minimum number of absences disqualified the absentees from obtaining signatures of attendance. This plan, he urged, was a sufficient guarantee, and if followed generally would render the necessity of a new recommendation, moved for by Mr. Macnamara, unnecessary.

Dr. Rolleston drew attention to the report of the Medical

Digitized by Google

Teachers' Associatiation, published in 1869, wherein the illusory nature of all such regulations as were being proposed as demonstrated. He believed the truest remedy lay in the healthy competition of the schools, and that the periodical issue of a "pluck and pass list" was the best guarantee for thoroughness of education. Dr. Andrew Wood's elaborate Scotch scheme he considered a farce, delusion, and snare. He desired to see a student *profit* from lectures; and these should therefore be good in themselves, to secure the mental attention and profit of the auditors. He insisted on the importance of competition and an adequate examination as the proper means of securing the end sought to be attained by the motion.

Sir DOMINIC CORRIGAN was of a similar opinion. He cited his experience of lectures in proof that these were little more than periods of recreation, in many instances the men attending them making use of the opportunity to read novels or do anything rather than attend to the subject of the discourse. The roll-call system he deemed entirely fallacious; and called attention to the fact that in Germany no such system of enforcing a student's presence is known. He should oppose the motion.

Dr. AQUILLA SMITH saw no hope of ensuring either regular attendance at lectures, or accurate returns of such attendances. He agreed in the main with Sir Dominic Corrigan, and believed that a good lecture would always be well attended. He considered the many obstacles in the way of efficiently carrying out the provisions of the motion made it valueless and impracticable.

Mr. TEALE considered that Mr. Macnamara sought to make the General Council responsible for the shortcomings of the licensing bodies. His personal experience of the roll-call was satisfactory, but possibly this arose from the peculiar circumstances in which the students at Leeds were placed, most of them being resident with medical men, who would accept attendance at lectures as a proof of regular conduct.

Dr. QUAIN felt convinced that a stringent examination would best secure a good education, not such fadding arrangements as roll-calls, &c.

Dr. STORRAR thought the only requirement sought should be the proof of a student's having spent a period of time at an appropriate educational centre, this to be followed by a stringent examination.

Sir WILLIAM GULL declared that his experience of students had been to show that they readily enough attended valuable demonstrations; and he urged that all professional examinations should be *practical*. The forced attendance of students at lectures, often of no value, he stigmatised as cruel.

Mr. MACNAMARA replied on the discussion, that the real point of his motion had not been touched on. He sought to have a man's *entrance* on medical studies at a proper time certified. He agreed, however, that voluntary attendance on *good* lectures could be relied on; and also that there was but small value in the roll-call, as such. He hoped the vote of the Council would be on the subject of the motion, and that it would not be influenced by the interesting discussion they had listened to on compulsory lectures.

The motion on a division was lost.

PRECAUTIONS AS TO EFFICIENCY.

Dr. HAUGHTON next moved "that the Council do proceed to inquire what precautions are taken by the several medical authorities and corporations to secure that the certificates accepted by them from the several medical schools and hospitals guarantee a definite amount of attendance on the part of the holder on lectures, dissections, laboratory work, and hospital work; and are not merely receipts for money paid without inquiry into the actual attendance of the holder of such certificates." He said that his fifteen years' experience in Trinity College, Dublin, convinced him that some such provision should be adopted. He felt grateful to Sir William Gull for his intelligent exposition of examination aims, with which he fully agreed. Nothing, he was sure, could replace the *living teacher*, whose direct influence on the student might not be over-estimated. Many subjects could not be taught by books, and such elements of knowledge were only acquired by direct contact with the teacher, the source of information. Trinity College, Dr. Haughton continued, had minimised lecture attendances, but the lectures that were retained sufficed to give the student all the essentials of material knowledge. He felt sure the multiplication of lectures was productive of evil, and could mention that there were two regular classes of certificates obtained by means of them. The first was a mere money receipt, and was no guarantee that the holder had undergone regular instruction, although it was received by licensing bodies in evidence of education. The other class, were certificates endorsed by lecturers, on which alone, he urged, could any reliance be placed, although even abuses of this system were not unknown, as was pointed out after. Dr. Haughton reminded the Council that the abolition of roll-calls meant the suppression of fees paid for lectures, which would be taken up by no students save on compulsion.

The motion having been seconded by Mr. Macnamara, Sir DOMINIC CORRIGAN said he agreed generally with Sir William Gull that a practical examination is desirable; with the motion, however, he must express disapproval, for he was convinced that the examination test is the truest guage of a man's attainments. Adverting to the charge brought by Dr. Haughton, he expressed assurance that every hospital in Dublin would be obliged to yield both classes of certificates, should they be insisted on by the body of students, since the existence of the hospital as a teaching centre, was wholly dependent on the student patronage it received.

Dr. AQUILLA SMITH, while desirous that the attendance of students at lectures should somehow be secured, deprecated the useless multiplication of *recommendations* issued by the Council, especially since compliance with them could not be enforced.

Dr. STORRAR denied that the Council's recommendations were sometimes laughed at, as Dr. Smith had asserted. Dr. Smith, however, repeated his assertion, adding that he was certain of the truth of his statement.

Sir JAMES PAGET said he thought no rule could be made in reference to certificates of attendance, which might not be evaded. The rectification of the abuses complained of can only be hoped for through the action of the honourable and gentlemanly feeling of the whole profession, students included. He should regret to see the motion converted into a recommendation. He urged that examinations should be in the *principles* of knowledge, rather than a test of mere acquisitive capacity. To this end a practical examination is not possible; only by personal interview and oral questioning, supplemented by paper work, can such information be extracted. The Council, he added, had to decide as to methods of education, and he thought it ought not to go forth to the public that it regarded attendance at lectures as unnecessary. It behoved them to act with extreme caution in deciding on any point of this nature. He preferred to place implicit trust in the honour of teacher and student, as a means of effecting the result sought to be attained.

Prof. HUMPHRY thought it impossible that examination alone could be a sufficient test of knowledge. Even the London University examinations were after all only minimum tests, and any man might be examined to pass them. He was sure that the *principles* defended by Sir James Paget were the essential bases of education. It had, he considered, been too freely admitted that lectures were a valueless means of communicating information. Students should be induced to cultivate *personal* relations with their teachers, as thus would they glean the most valuable kind of knowledge. He believed that compulsion to attend lectures pressed most heavily on the careless and indifferent men. His personal experience was that voluntary high-class lectures were well attended by the best students, and he strongly advocated frequent *class examinations* as an aid to study.

Dr. QUAIN was sure that if lectures were attractive they need not be compulsory. At Dr. Sharpey's lectures, for example, sitting room for all who flocked there could not be found, as many as 400 attending. He endorsed Prof. Humphry's opinion as to class examinations.

Dr. ROLLESTON would remind the Council that there were good examinations and bad examinations, and drew attention to the "Staats examen" of Germany, the whole time occupied in examination being four months. The test is intensely practical, and as a means of proving a candidates knowledge, in every way adequate. He would like to see such examinations, or an approach to them introduced into this country, as by means of so complete a system the elimination of every fallacy might be ensured. He reminded the Council that they had had before them, ten years previously, a document (Report of Council on Medicel Education, with three Appendices) which virtually trod the ground they had been over that day.

Sir WILLIAM GULL advocated the *intellectual test* of every candidate for entry into the medical profession. Such test must of necessity exclude 33 per cent. of the candidates; since so many, he felt sure, would if properly tried, be found

Digitized by Google

fitted only for mechanical pursuits, and in no way mentally equipped for the medical life. He added, that the present examination system in this country is unfair to candidates.

Mr. SIMON thought the discussion had been the most discursive he had ever listened to in that place. Though he disliked the wording of the motion, he must agree in its general principle, and was guided to such decision by a private communication made to him, during the adjournment, by Dr. Haughton.

Dr. HAUGHTON, replying, said he had personal knowledge that certificates had been issued to men for attendance on lectures, who had never been present at a single lecture of the course, and hoped the knowledge that such do exist would influence the whole of the Council on his motion, which sought to remedy so glaring an abuse.

The motion was lost, the numbers being 6 for, 12 against.

THE CASE OF ADAM ADDISON.

A motion was put from the Chair, that the name of Adam Addison, who was convicted at the Old Bailey of the murder of Ann Robinson, and sentenced in May last to penal servitude for seven years, be erased from the Register, and was carried without discussion.

THE CASE OF PATRICK JAMES MURRAY.

This was the case of an appeal from Mr. Patrick James Murray against the action of the Colleges of Physicians and Surgeons of Ireland, in removing his name from the roll of licentiates. And a further prayer was read from him that his name should not be removed from the Register; thereupon some discussion ensued as to the power of the Council to act in this matter, and the opinion of the Council's legal advsier (who was present) having been given, to the effect that the name of a disqualified practitioner could not be legally retained on the Register, the motion from the chair, that the name of Patrick James Murray be erased from the Register, was carried.

ELECTION OF PRESIDENT.

Dr. ACLAND was re-elected for a term of five years.

THIRD DAY—SATURDAY, JULY 19TH.

The minutes of the preceding day's business having been confirmed, Dr. ROLLESTON rose to add an explanation to the remarks he had made on Friday bearing on the German "Staats Examen." Dr. Andrew Wood had asserted that considerable alteration had been made in the scheme as described by him (Dr. Rolleston), and had mentioned Mr. Turner as his authority for the statement. Dr. Rolleston was glad to see Mr. Turner present now, and that gentleman would bear him out in the statement that the alteration mentioned was one of the most trifling nature, having no bearing on the examination itself, but having reference merely to the dress of the officialf who superintended it. He again referred to Billroth's excellent treatise on the "History of Medicine" in support of his statement; and to the Report of the Educational Committee, laid before the Council ten years ago.

The PRESIDENT then announced that Mr. Simon found it impossible to serve on the Executive Committee, of which he had been elected a member. Sir James Paget, continued the President, had reconsidered his decision not to accept a place on the Committee, and was ready now to undertake the duties should the Council be desirous of conferring the honour of re-election on him. A ballot then took place, and Sir James Paget was declared unanimously elected to fill the seat on the Committee vacated by Mr. Simon.

Dr. AQUILLA SMITH being in possession of the house at the adjournment on Friday evening, now continued his speech on Mr. Macnamara's motion :—

"That in all questionable cases, where persons whose names have been removed from the Register under Section xiv. of the Medical Act (1858) seek restoration, the Executive Committee, before complying with the request, shall put themselves in communication with the medical authorities whence the qualifications were originally derived."

Dr. Smith spoke at considerable length, dwelling on certain cases of malpractice (including that of Patrick James Murray) and defended the action of the Executive Council, which had been blamed for not at once communicating to the respective licensing bodies the information they possessed as to the irregularities of conduct on the part of such bodies' licensees.

The PRESIDENT also defended the Executive Committee, and declared it to have discharged its duty in full, and faithfully; and speaking personally, without lending his utterance any official weight, he was strongly of opinion that the motion ought not to be carried.

Dr. ANDREW WOOD thought it right the Executive Committee should communicate the knowledge they had of irregularities to the corporations which were interested therein through the acts of those holding their licenses. But he would remind the Council that Clause 14 of their Act compelled the insertion of a duly accredited name on the Register. He hoped Mr. Macnamara might be induced to withdraw his motion, and leave future cases to be dealt with by the good sense of the Council.

Dr. ROLLESTON trusted the motion would not be withdrawn. The English law, he said, coupled together rogues and vagabonds, and, as in one of the instances quoted by Dr. Aquilla Smith, the suspected person was a vagabond in consequence of his possessing no known abiding place, he was therefore, by implication a rogue, and any motion which would apply to this class of men must be a desirable one.

Considerable discussion then ensued of a more or less conversational kind, but was chiefly a repetition of the argument already employed. There engaged in it Drs. Quain, Humphry, Andrew Wood, Sir Wm. Gull, and Sir Dominic Corrigan, the latter entreating Mr. Macnamara to withdraw his motion, which he considered nonsensical. The outcome of the discussion was the alteration of the motion to read as follows :—

"That in all questionable cases, where persons whose names have been removed from the Register under Section xiv. of the Medical Act (1858) seek restoration, it is desirable that the Executive Committee should, without delay, put themselves in communication with the medical authorities whence the qualifications were originally derived."

Mr. Macnamara having accepted the motion as amended, it was carried in this form.

IRREGULAR PRACTICE AT HOSPITAL SCHOOLS.

Dr. PITMAN wished to be permitted to interrogate Dr. Haughton concerning the charge brought by him on Friday against a medical school which had been guilty of uttering certificates falsely testifying to the attendance of the grantees at lectures, and on hospital work. Dr. Pitman urged that his position on the board of the corporation he represented made it imperative on him to ask for this information, since he might, unknowingly, be in the habit of receiving, in his official capacity, testimonials which were valueless, and through faith in which the candidates presenting them might be admitted to privileges they were not rightly entitled to.

Dr. HAUGHTON said his reference on the preceding day had been to a hospital and school in Dublin, which he was informed on direct and unimpeachable authority had been guilty of the practice he had condemned. His informants were students from this school, who had come before him as candidates for the degree in medicine conferred by the Dublin University, but he felt bound to withhold the names of the gentlemen, and also of the body who had committed the irregularity. The confessions, that these students had obtained certificates of attendance at lectures by a mere money payment, were made to him confidentially.

Sir DOMINIC CORRIGAN raised the objection that no question was before the chair, and Mr. Simon expressed regret at this interference, since the subject under consideration was one of the most vital importance; but Sir Dominic Corrigan repeated his objection that there was no question before the chair.

Sir WM. GULL thought the Council could not permit the matter to rest here, and moved that the Branch Council for Ireland should have its attention drawn to the reported fact that some Irish School does grant certificates of attendance in cases where no such attendance is given. Such a motion would, he urged, be a becoming evidence that the Council was duly alive to the responsibility that rested with it, and in no other way could they fitly take cognisance of the irregularity.

Sir DOMINIC CORRIGAN suggested that the motion be altered, so that it should read "the report that," instead of "the reported fact that," since the evidence necessary to substantiate a fact was not forthcoming.

The motion was formally worded in accordance with this suggestion, and having been seconded by Mr. Simon, was carried.

Sir Dominic Corrigan and the Select Committee.

Mr. Bradford wished to ask Sir Dominic Corrigan if the representations he was reported to have made to the Parliamentary Select Committee on the Medical Acts Amendment Bill, concerning the constitution and alleged defects of the General Council, were truly detailed in the medical journals of the day.

Dr. Haldane rose to order, and urged that the Medical Council should take no notice of this question, to which Mr. Turner agreed. Sir Dominic's evidence, he said, was extra-Parliamentary as far as their body was concerned, and it would become them best to take no direct notice of it.

The President thought it well that the question should be withdrawn. As a mere inquiry concerning a fact it was a perfectly harmless demand. Still, he was of opinion that any discussion in that place as to the theories of members of the Council would be exceedingly undesirable and dangerous.

Dr. Humphry thought the question ought not to be read, since if it were it must go forth as an unanswered query.

The President then ruled that the question be not put.

Progress of the Medical Acts Amendment Bill.

Mr. Simon was about to draw attention to the present position of the Medical Bill, when

Mr. Turner asked if any motion was before the house, and whether it was competent to a member of Council to introduce a motion, without having previously given notice thereof.

The President considered that the subject of the Select Committee's proceedings ought to be referred to at the Council, and gave Mr. Simon leave to continue his observations, on condition that he concluded with a motion.

Mr. Simon, having endorsed the Presidential opinion that the Council could not rightly dissolve without taking some notice of the Parliamentary proceedings, Mr. Turner said the Council must first decide if it wished to hear the motion.

There spoke in succession the President, Dr. Storrar, Sir Dominic Corrigan, Sir William Gull, and Dr. Andrew Wood, the latter objecting to the reading of the motion since reference to it had been omitted from the programme of the day.

Dr. Rolleston and Mr. Turner were followed by the President, who ruled that the motion should be handed in to the Business Committee for consideration, but remarking that expedition of business was a desirable thing, he further decided to seek the immediate decision of the Council on the advisability of hearing Mr. Simon's motion.

Dr. Andrew Wood strongly objected to such a course being taken, but eventually Dr. Aquilla Smith, and other members, having expressed their opinions, Mr. Simon read his motion, which was to the effect that the subject matter referred to the Select Committee is too extensive for its consideration. Further, that as the Bill would in all probability never become law, and as the Lord President's Bill contains many desirable suggestions, that, therefore, the Government should be urged to pass the clauses on which general opinion is unanimous. He thought, too, a provisional Act ought to be passed requiring in future from candidates for registrable qualifications, evidence of adequate knowledge in medicine, surgery, and midwifery. Should the Business Committee think it unadvisable to deal with the motion during the present session of the Council, added Mr. Simon, he would not press its consideration.

Dr. Andrew Wood thought it was decidedly inconsistent, and that the introduction of the motion would protract the deliberations of the Council to a great length of time, possibly to as much as ten days.

Mr. Simon was bound, he said, to submit to the judgment of the Business Committee, and would withdraw his proposal, though he still thought the Council should take up the subject.

Registration of Dentists.

The following communication from the Royal College of Surgeons in Ireland (under date April, 1879) in answer to a letter sent pursuant to the General Council's Resolution 21 of the meeting on March 26, 1879, was read by the Registrar:—

"With reference to the Dental Curriculum, this Council have agreed to accept the General Regulations as laid down by the General Medical Council, but they cannot accept that portion of the regulations relating to the examination of candidates, *sine curriculo*, up to August 1881, whereby the examination of candidates for their license would be confined to residents in Ireland. This in their opinion could not be justified by what has hitherto been, and still is the practice, in regard to medical and surgical qualifications, or which obtained in England at the time the qualification in dental surgery was instituted by the Royal College of Surgeons of England."

Dr. Andrew Wood thought the same privileges as were accorded to England should be extended to Ireland and Scotland, and moved that the words Ireland and Scotland be omitted from the regulation.

Sir Wm. Gull did not fully gather the effect of this, and considered that the registration of practitioners should be in that division of the kingdom in which they had their practice; for he contended it was a dubious proceeding on the part of a candidate for a diploma to seek it from a foreign source.

Dr. Andrew Wood pointed out that Sir Wm. Gull ought to hail with pleasure the readiness of the English College of Surgeons to open its doors to any candidate whithersoever he comes, and whatsoever his knowledge, provided only he passed a stringent examination, since Sir Wm. Gull had only the day preceding expressed the opinion that the examination test was the paramount one.

Mr. Simon said the Royal College of Surgeons had for years been granting dental licenses. Facilities had now been given to the Colleges of Scotland and Ireland to act similarly if they saw fit to exercise the power, and a common dental title had been made. He regarded with great suspicion the migration of candidates from one country to another, diploma-hunting.

Dr. Humphry was followed by Mr. Macnamara, who urged that the original motion sought to deprive the Royal College of Surgeons of Ireland of a privilege, and that body naturally resented the attempt made to curtail their powers. The College insisted on a sufficiently stringent examination, but refused no one admission to it. If such a regulation is to be made as to dentists, it ought to be applied to all other branches of the profession. He trusted the omission suggested by Dr. Andrew Wood would be agreed to, the more especially as the Council could not insist on the adoption of its recommendations.

Sir Wm. Gull regretted the feeling which led men to seek degrees abroad, and he would move that the College of Surgeons (of England) should be requested to reconsider its determination not to examine candidates for its diploma in dentistry, who come to it, *sine curriculo*. It was most unbecoming to drive men to Scotland and Ireland for degrees in the power of the English College to bestow.

The motion of Dr. Andrew Wood having been read from the chair, Dr. Fergus moved as an amendment that the Council adhere to the original regulation of March 26th last. He thought it wise to restrict as much as possible all honorary titles, for by multiplying them the entry of undesirable candidates into the profession was aided. It being pointed out, however, that the proposed amendment amounted to a proposition negative to the motion, the latter (Dr. Wood's) only was voted on, and carried.

Sir Wm. Gull then introduced, and Dr. Haughton seconded, a motion to request the College of Surgeons (England) to reconsider its decision not to admit candidates for its dental license, *sine curriculo*.

Mr. Teale feared that this must lead to a degradation of the standard of the dental license.

Mr. Turner believed such fears groundless. Since a stringent examination would be the only portal by which candidates would be enabled to enter the body of licensees, the motion might be safely carried.

Dr. Quain pointed out that the introduction of the *sine curriculo* principle by the English College would remove the excuse men now had to go elsewhere for their license.

Dr. Storrar spoke at some length. He deprecated the year of grace which had been accorded in the regulation, and thought the new plan could not operate too quickly. The introduction of a stringent examination would be good, but he quite believed the action of the College up to the present had been productive of benefit.

Mr. Simon said the College of Surgeons had acted very deliberately in pursuing the course it had adopted. The motion affected the delicate question of the internal administration of the College. Formerly men had been admitted as dentists *sine curriculo*, but of late a special curriculum had been demanded. The candidate who had been required to fulfil this condition might, he contended, feel naturally aggrieved if now the restriction were withdrawn, and *their*

Digitized by Google

diplomas thus reduced in value, and diminished in prestige. He would assure the Council that the Royal College of Surgeons always most carefully considered its action. He was not prepared to say whether the recommendation would be adopted, but felt, for his own part, that the College, while fully respecting the General Medical Council, might still adhere to its own opinion on the matter. It was not prepared to debase its currency.

Dr. ANDREW WOOD reminded Mr. Simon that in the part he referred to there was neither dental curriculum nor register. Under the altered circumstances, he thought the College should reconsider its determination.

Sir WM. GULL pointed out to Mr. Simon that the whole circumstances were changed in recent times. The Council being called on to construct a dental register, should do its best to make it as good as possible, and his motion would do something to that end, if carried.

The motion, on being put, was agreed to.

On the motion of Dr. Humphry, seconded by Dr. Storrar, it was agreed that the application of a number of foreign institutions to have their certificates registered in the "Dentists' Register," be not granted.

A number of votes of thanks to officers of committees, and having been passed, the proceedings of the session terminated.

Special.

THE MEDICAL TEMPERANCE ASSOCIATION.

THE first annual meeting of the Medical Temperance Association took place last Thursday, at the rooms of the Medical Society of London. A numerous gathering of members of the profession supported the President of the Association, Dr. B. Richardson, F.R.S., who occupied the chair. The proceedings commenced with a short and interesting account by the President, of the construction and method of employing his new instrument, the Sphygmophone. He showed in what way it could be made a useful auxiliary to other methods of diagnosis in the case of heart disease, arterial tension, and so forth. The beatings of the radial artery were made perfectly *audible* to those sitting at the most distant part of the room, and to the extreme astonishment of those who probably were not familiar with the earlier performances of the phonograph. Professor Hughes' Audiometer, with modifications suggested by Dr. Richardson, was next explained. This instrument promises to be useful in determining the acuteness of hearing, and it is quite apparent that both instruments are destined to become valuable accessories to the *adjuvanta* of the physician.

Dr. Richardson's demonstrations were followed by Dr. Norman Kerr, who gave an able *resumé* of recent investigations on the "Toxic Action and Power of the Alcohols." The greater part of the results lately obtained must, however, be regarded as confirmatory of Dr. Richardson's researches, made some fifteen or sixteen years ago, and communicated to the British Association, rather than as anything perfectly new. Nevertheless, it must have been gratifying to this original and able investigator to find his early researches in this field of inquiry, confirmed in almost every particular by the independent researches of skilled and capable chemists. The practical outcome of such work is quite obvious, it affords us a fuller insight into the action of the ethyls, especially in combination with the essential oils and other products of fermentation, and it also makes us better acquainted with their precise action in the human economy. It is, we need hardly say, of very great importance in practice, and in the administration of a drug, and we suppose Dr. Richardson will not deny alcohol a place amongst remedial agents or drugs,—to know that this or that wine or spirit contains a certain quantity of a toxic agent, in combination with, to most patients, an agreeable and palatable drink, and must, therefore be prescribed with caution in the sick room. We must confess to some disappointment on finding that glycerine must be classed amongst the toxic products of distillation, but such unfortunately is the case, and the fact should be known to those who prescribe it largely in certain affections, and often as a substitute for cod liver oil. The lesson to be learnt from Dr. Kerr's paper is, that when we may deem it advisable to employ alcohol, we should order alcohol pure and simple, and not in the form of wine or spirit—of the composition of which we are, for the most part, utterly ignorant.

As to the object this newly-formed society has in view, it appears to ourselves to be praiseworthy. Its chief aim is to advocate and advance the practice of total abstinence in and through the medical profession, and to promote further investigations as to the precise action of alcohol in health and disease. It also aims at being a bond of union amongst medical abstainers scattered throughout the country. It admits as members all registered medical practitioners, who may be regarded practically as abstainers from all alcoholic drinks. It admits as Associates medical students, who are likewise expected to abstain, and we are glad to see that a number of medical students have already enrolled themselves members of the Association. Neither members nor associates are, it appears, required to sign any pledge.

We would, in no carping spirit venture to say to those who desire the complete success of the movement, that an essential element in this direction will be to see that good wholesome drinking water is provided as a substitute for the various intoxicating drinks in use amongst all classes. The poor of London, in particular, are badly off with regard to water; and, month after month, we find it reported on the authority of Professor Dr. Frankland and Colonel Bolton, that the water supplied, by the various metropolitan water companies, "is quite unfit for dietetic purposes on account of excessive pollution with organic matter."

WEDNESDAY, JULY 23, 1879.

ABOLITION OF VIVISECTION.

FEW people, whose zeal in any cause is tempered by discretion, will be surprised that, after the discussion which took place on this subject in the House of Lords,

Digitized by Google

the Bill for the total abolition of vivisection was rejected by a majority of 81, only 16 voting for it.

The scriptures say: "Be not righteous over much," and, judging from the way in which this agitation against experimenting upon living animals has been all along conducted, and the length to which its supporters would go, it is possible, it would appear, to be also "*humane* overmuch." We heartily sympathise with the feelings of those who are horrified at any wanton cruelty being practised upon the lower animals, and who wished that some restrictions should be placed upon a method of investigation, in which it was just possible that such cruelty might be inflicted. But that a certain custom or habit is liable to abuse, is no reason why it should be absolutely given up, but that it should be so regulated as to bring the possibility of such abuse within the narrowest compass.

It is difficult to imagine on what grounds the supporters of the Bill could insist upon the total abolition of a practice which, in this country, was confined to a few physicians and physiologists whose humanity is perhaps as irreproachable as that of the pharasaical anti-vivisectionist himself. What, then, were the arguments adduced by the noble Lords who moved that the Cruelty to Animals Bill be read a second time? That a requisition to this effect has been signed by many thousands; that the measure which has been passed by the Government did not effect the object in view; that vivisection was a cruel and immoral practice; that the great discoveries in medicine and surgery had not been made by vivisection; that there were thousands who believed that all restrictions were a failure; that under the ægis of the present Act, Dr. Rutherford had performed some cruel experiments, the practical utility of which was open to much doubt; that a French physiologist had been guilty of the most barbarous cruelty; and that learned treatises had been published denying altogether the value of vivisection—these are the kind of arguments, and all the arguments, which we could discover in the respective speeches of the Earl of Shaftesbury and Lord Truro. The reader will at once see that while many of them are only applicable to the placing of some restriction upon the practice, a question which was not under discussion, the rest were, indeed, very weak arguments in favour of its total abolition.

That memorials and petitions have been signed by thousands upon thousands we do not for a moment doubt. The enthusiastic anti-vivisectionist has taken good care of that. Nor has he been at all scrupulous as to the means he employed to inflame the mind of the public on this subject. These means are too well known to the profession to necessitate our describing them in this place, and Earl Beauchamp was partly alluding to them when he contrasted the temperate and straightforward conduct of the Society for the Prevention of Cruelty to Animals with the extraordinary secrecy and mystery adopted by Anti-vivisection Society. "This society," he said, shrank from affording proper facilities for duly testing the assertions and opinions they uttered;" and well they might shrink, considering that most of the cruelties they describe existed only in their imaginations, and that they had made the most groundless and wanton assertions on the subject. As the Earl of Carnarvon, remarked "it became those who supported the Bill to show that the Act of 1876 was a failure." This they were unable to do, for so far from showing vivisection has been extensively and cruelly practised in spite of that Act, the returns showed that the practice was not so largely adopted as the anti-vivisectionists led people to suppose. One return showed that only 48 licenses were granted in 1878, of which 18 were not acted upon, another, that of 481 cases only 16 were accompanied by appreciable pain.

Some of the other arguments brought forward last Wednesday had little to do with the question at issue. It does not follow that because certain French physiologists have performed some very cruel experiments, we should do the same. It does not follow that, because Dr. Rutherford's experiments are open to criticism, therefore all experimentation on living animals should be abolished. That vivisection is, in principle, "cruel and immoral," is a creed from which many will withhold their consent, and what, moreover, may be true of a practice that is placed under no license or restrictions whatever, may not be equally true of the same practice when placed under such restrictions as will avoid those abuses to which it is said to be liable.

But while little can be said in favour of putting a stop to vivisection altogether, there are very good reasons why medical men and physiologists should, under certain conditions, have the opportunity of practising this method of investigation, and why the passing of such an Act as that proposed would not only be making, as the *Times* said, humanity appear ridiculous, but would not even attain the object which the abolitionists have in view. For were such an Act passed, those who were actuated by a thirst for knowledge would pursue those operations in privacy and without due securities against abuse, or we should have some of the most intelligent and promising of our students and physiologists driven to other countries, or we might even find, as the Bishop of Peterborough remarked, that such an Act would lead to virtual experiments on human subjects. Very little consideration will show that it would be almost as difficult to prevent private experimenting on living animals as it would be to prevent private betting, and that, moreover, one result of vivisection, in any shape or form, being made illegal, would be that many enthusiastic votaries of science would be tempted to do secretly and in their own way what the law prohibited them from doing openly. And thus, what with the secret practice of vivisection in this country, and the increase in the practice abroad (consequent upon British experimenters resorting to other countries for the purpose of carrying out their researches with more freedom), the animal world would be no better off, and the cause of humanity not in any degree furthered by such a Bill as Lord Truro has just tried, and still threatens, to pass through the House of Lords. Again, the Bill was directed against cruelty to animals, but as the Bishop of Peterborough very justly remarked, everything depended upon what was meant by the world "cruelty." It might be defined as the infliction of unnecessary pain. "If, however, the object for which pain was inflicted could be justified, and if the pain was not in excess of its object, it could not be properly characterised as cruelty." Now,

Digitized by Google

as a matter of fact, the aggregate degree of pain inflicted on these occasions by English experimenters amounts to very little. As we have just noticed, out of nearly 500 cases only 16 were accompanied by appreciable pain. Nor could we expect otherwise. Englishmen are not, as a rule, remarkable for their inhumanity; they do not approve, any more than the anti-vivisectionists approve, of the cruelties that have been practised by some foreign investigators, whilst in chloroform and other anæsthetics the experimenter has not only one agent which will render nearly all his operations painless, but the very action of which facilitates the performance of his experiment, thus giving him a direct interest in maintaining the animal vivisected under the influence of anæsthetics.

Although Lord Truro found so few in favour of his Bill, we are still threatened with renewed attempts to put a stop to all experiments on the living animal. We feel it, therefore, our duty to remind those members of the profession who are engaged in original research that it rests in a great measure with them whether these unreasonable and fanatical humanitarians shall gain the object they have in view, and whether the time will come when the physician or physiologist will have to lay down his scalpel and trust to such accidental experiments as Nature may present to him in the course of his practice. It is unfortunately true that Dr. Rutherford did perform several experiments which were open to the criticism not only of the anti-vivisectionists, but also of his professional brethren; and that, moreover, some of these experiments were, as the Earl of Shaftesbury stated, ridiculed in the Hunterian Oration delivered by Dr. Moxon in 1877. Now it is very undesirable that we should do anything that would in the least degree fan the agitation that is still likely to exist on the subject of vivisection. If the physiological or therapeutical investigator is not to be further hampered than he is at present, and if the law is to be made less rather than more restrictive than it is now, he must show that his humanity is quite equal to his thirst after knowledge and his zeal in the advancement of science; and before performing his experiments he should, both from motives of humanity and for his own credit's sake, consider whether the conditions under which they are performed are or are not such as might involve some fallacy in the inferences drawn from them, or even whether the results obtained are likely to be sufficiently reliable to warrant a severe and perhaps "cruel" operation. Not that the failure of a vivisection experiment is any proof that it should not have been made; as of course such a result cannot always be avoided. The very nature of an experiment is such that the outcome of it may be of an entirely negative character. Or the result may be still more unfortunate—it may be fallacious, and lead to error instead of truth. Nevertheless, this fact is a very unfair argument to use in favour of abolishing the practice of vivisection altogether. Were no experiments made except those that were almost certain to prove successful, nothing would be found out. If, however, the anti-vivisectionist, persist in making use of such argument, all we can do is to exercise as much discretion and humanity in the performance of these experiments as circumstances will admit of. The rest we must leave in the hands of the State, and trust that before long a more rational and enlightened public opinion will induce the Legislature to diminish, rather than to increase, the restrictions that are now placed upon scientific research.

COUNTER-PRESCRIBING AND DOCTOR DISPENSING.

The chemists and druggists were, some time since, transported to that paradise which is not supposed to be the habitation of wise men by a decision half-favourable to their right to prescribe across the counter given in the case of one Shepperley, of Nottingham, who was prosecuted by the Medical Defence Association for acting as a medical practitioner contrary to the English Apothecaries Act. The gratifying sense of security, into which the counter-prescribers were thus lulled, has been rudely broken by the decision of Mr. Motteram, Q.C., the Judge of the Birmingham County Court, in the prosecution of the Apothecaries Co. *v.* Harrison. The judgment was an elaborate written review of law and precedent bearing upon the matter, and may be taken as the fullest review of the legal aspect of the question which has yet been given. The facts were quite simple. A woman went to the chemist and described her ailment; she swears that he looked at her tongue, felt her pulse, made inquiries as to uterine troubles, and, in fact, did everything that a doctor could do short of a vaginal examination. This testimony the druggist to a certain extent denied, seeking to make it appear that he made no investigation of the disease, but simply made up a tonic.

After a review of the facts, the judge said, in reference to the method in which the business of chemist was pursued in 1815, *i.e.*; before the passing of the Apothecaries Act—

"The evidence on this point undoubtedly shows that chemists, in carrying on their business before the year 1815, did something (lawful or otherwise) beyond selling medicines, and if the present, instead of being a case of a serious character, as I find it from Dr. Suffield's evidence to have been, it had been of the trivial nature of those referred to in the evidence, the second part of the defence would have arisen and would deserve serious consideration; but the evidence convinces me that, though chemists before 1815 might have advised in trivial cases, they were not in the habit of advising and prescribing, as the defendant had done, in a case of the serious nature of the present, but would have sent such a case to the apothecary. If, however, it be correct, that before 1815 some chemists were in the habit, in trifling cases, of advising as well as supplying persons with medicines, it does not in the least follow that they ever had the legal right to so advise and supply the medicine, or are protected by the 28th Section of the Act in case they do. I think it is very probable that some chemists before 1815 did act as some do now; but if they did, I believe they had no legal right to do so, and were usurping the rights of those who had. What business therefore the section provides is not to be affected by the Act, and what might be carried on notwithstanding the Act, would appear to be not that trade of a chemist as carried on by him in the 'advising and selling medicines,' but only as he carried it on in the buying, preparing, compounding, dispensing, and vending his drugs. So it is this trade or business of a chemist so described, not the enlarged or extended one, that the Act permits him to carry on, and protects him in doing as fully as he might have done before the passing of the Act. The legislature would appear not to have known (if, indeed, it existed) of

Digitized by Google

this extended business of a chemist as now contended for; or if it did, it appears to have ignored it as no part of the legitimate business of the chemists, and declined to protect them in the exercise of it after the passing of the Act. I have made these few observations for the consideration of the defendant, and those associated with him; they form no part of my judgment, which is in no way founded upon them, for, as I have already said, I find the present case was of a serious if not a dangerous nature, and in that view of it I don't understand that even the defendant's counsel would contend his client had the right to treat it as he has done. Verdict for plaintiffs £20 and costs."

This decision, though conclusive that chemists and druggists never had, and have not now, any legal right whatever to advise and prescribe, is altogether unsatisfactory, because it is based upon the fact that the disease prescribed for in this particular case was of a serious, *not* a trivial nature. It would seem to be inferred that a chemist may legally advise and prescribe for any patient who, at the time, is not "seriously" ill. Such a judgment is a *reductio ad absurdam*, for how could either patient or prescriber form a decisive opinion as to the gravity of the illness; and a *fiction*, how could any jury subsequently say whether the patient was "seriously" ill when the chemist was consulted, or, on the other hand, was either convalescent from serious illness, or only in the first stage of dangerous disease? and how could the chemist himself draw a line between the "trivial" cases for which he might legally prescribe, and those more "serious," which he might not touch.

It really seems to us that the only way out of the present most objectionable and most dangerous system of doctoring by unqualified and ignorant persons, is the complete dissociation of pharmacy and medicine. We hold the opinion that the vending of drugs, tooth-brushes, and pomatum by duly educated and qualified medical men is as much a prostitution of their legal rights as the treating of sick people by poison-vendors is of theirs. We cannot blame the druggists for persisting in the pursuit illegally of a practice of which they are ignorant, when we find that a vast number of medical practitioners pursue a trade of which they never knew much, and which is totally outside their professed business. A decided advance to the severance of pharmacy and medicine was made recently by the Rochdale Chemists' Association, the report of whose proceedings we find in the *Chemist and Druggist*. That Association appointed a committee to take steps with a view to an arrangement for the dispensing of medicines to be done by the chemist instead of by the medical man as at present. The first thing that was done was to make somewhat extensive inquiries in different parts of the kingdom as to the practice now in use, and as to the effect, so far as the interests of the medical man and the public are concerned.

Expressed briefly, the following were the results of the investigation:—In 16 large towns in England, the practice of medical men dispensing their own medicines is either not known or little followed. In 15 less pretentious cities, there are many medical men who do not dispense. In 14 others the practice largely prevails, but it is not universal; and in 27 minor towns the doctors do all their dispensing, with but rare exceptions. After this, the whole of the medical men of Rochdale were invited to meet the committee. After this, another meeting with the medical men was arranged, when the following document was submitted to the meeting for the purpose of convincing the medical men:—

It is argued by medical men that if patients are not supplied by them with medicine they will have to charge a reduced fee, the loss of which will not be covered by the saving in drugs and charges connected with dispensing.

The loss the committee considered would be more than covered by one extra visit per day in each week of six days, or one visit more per day throughout the year would more than cover the loss, and pay for the few drugs which would be kept for emergencies.

How would the poor and the very poor pay for their medicine?—A standard price being adopted for general use, exceptions would be made as follow:—The prescription might be marked with the letter P (poor) by the medical man, if he thought any case deserving of such a distinction, when the chemist would charge one-half or one-third the ordinary sum; and, where the patient was very poor, the mark might be V.P., when no charge would be made for the medicine then supplied, but this would be followed by the chemist giving a recommendation to the dispensary, or he would refer the case to the Charity Organisation Association (if formed), or an arrangement might be made with the guardians to pay one-half or one-third the standard charge, for those in receipt of parochial relief.

What about counter-prescribing?—Ever since the incorporation of the Pharmaceutical Society, chemists generally have discouraged prescribing in the hope that they would ultimately have the duty of dispensing the prescriptions of medical men. Where this practice prevails there is no prescribing done by the chemists, except for such simple ailments as the medical profession do not care to treat, or the public do not think of asking their advice about. The result may be thus briefly summed up—the more dispensing by chemists, the less prescribing; the less dispensing, the more prescribing.

After the reading of the above document, there appeared to be a dead stand at the first difficulty, viz., that of pecuniary loss to the prescriber. On the whole the result was negative, save that the question was raised with a prospect of eventual settlement.

We may, perhaps, give some strength to the movement by pointing out that the experiment of a complete separation of pharmacy and medicine has been tried on a gigantic scale with perfect success. In Ireland, but very few practitioners in the large cities ever think of dispensing their own medicines; and, in the country districts, no one does so who can possibly supply his patients with their medicines in any other way; and yet the Irish practitioner is, on the whole, quite as well off, and occupies a much higher social position than his English or Scotch *confrère*.

The time and freedom of mind which he gains by tabooing personal connection with the apothecaries shop more than compensates, in earning power, for the profits which he would make by making up mixtures, lotions, and pills, which the patient does not want, and he enjoys as his balance of profit to credit of the Irish System—the advantage of getting his fees cash down, keeping no books, furnishing no Christmas and Easter bills, and ranking as a gentleman if his demeanour deserves it.

Utopian as the inspiration may be, we cherish the hope that eventually the medical practitioner will devote his skill to the consummate use of the tools which the pharmaceutist places in his hand, and that the pharmaceutist will content himself with producing those agents of the very best attainable quality, the Republic of Medicine being

Digitized by Google

thus a co-operative compact between the parties who are now injuring themselves and each other by an unmeaning contention.

Notes on Current Topics.

Sanitas.

On Friday we had the opportunity of seeing how this excellent disinfectant and antiseptic was manufactured. About 150 gentlemen, among whom were the Marquis of Exeter, Lord Alfred Churchill, Dr. Farr, Dr. Sedgwick Saunders, and several others interested in sanitation, had been invited to inspect the Sanitas Company's Works, in Three Colt Lane, Bethnal Green. The Duke of Manchester was to have presided on this occasion, but as illness prevented him from being present, an able substitute was found in Major Wood, who, after the company had partaken of a substantial repast, told them in an appropriate speech the object for which they had assembled. Mr. Kingzett also explained the theory of the process by which this disinfectant is manufactured, the construction of the apparatus used for the purpose, and the advantages which Sanitas has over all other preparations of the kind. He showed that the manufacture of the article chiefly consisted in blowing a large volume of air through turpentine floating upon water, by which means this turpentine was partly decomposed, with the formation of peroxide of hydrogen and camphoric acid. These products are taken up by the water, which on completion of the process, is drawn off and constitutes the "Sanitas" of commerce. Several experiments were also shown illustrating the valuable disinfectant and antiseptic properties that had been claimed for this substance. We need not tell the reader that in a sanitary point of view the efficacy of peroxide of hydrogen and camphoric acid can scarcely be overrated. That Sanitas contains these agents in large quantities, that it is perfectly innocuous, and of an agreeable odour, are circumstances which make it more valuable, and which will doubtless command for it a greater sale than any other disinfectant we are acquainted with.

Brompton Consumption Hospital.

There is perhaps no other charity in London which has more claims upon the sympathy and support of the public than this excellent institution. It is, therefore, with much pleasure we notice that the Prince of Wales laid, a few days ago, the foundation stone of a new building opposite the existing hospital in the Fulham Road. His Royal Highness was accompanied by the Princess of Wales, the Prince and Princess Christian, the Duke of Cambridge, the Countess of Macclesfield, and Lord Suffield. The approaches to the site of the new building were decorated with the flags, banners, and other marks of welcome usual upon such occasions. Among the ladies and gentlemen on the platform were the Duchess of Westminster, the Marchioness of Londonderry, the Earl and Countess Cadogan, Sir Julian Goldsmid, M.P., and Lady Goldsmid, Mr. Otto and Madame (Jenny Lind) Goldschmidt, Lord Ernest Bruce, Lord Ranelagh, General Macdonald, Sir Leopold and Lady M'Clintock, and Mr. S. C. Hall. The Prince and Princess of Wales were received by a guard of honour of the Queen's (Westminster) Rifle Volunteers, by the Earl of Derby (President of the Hospital), the Vice-Presidents, the Committee of Management, Sir Philip Rose (the Hon. Secretary), the Chaplain, Medical Officers, and Mr. H. Dobbin (the Secretary). After the Earl of Derby had given a statement of the present position and requirements of the hospital, the Prince of Wales made a remarkably able and appropriate speech, and this was followed by a special form of prayer from the Bishop of London, compiled by himself for the occasion. The Royal visitors were afterwards shown over the old hospital on the other side of the road, where their Royal Highnesses signed an illuminated copy of the scroll deposited in the glass vase, to be hung up in the board-room side by side with the scroll signed by the late Prince Consort upon his laying the foundation stone of the existing hospital in 1844.

Mr. Simon on Medical Reform.

In the fifth annual report of the President of the College of Surgeons, which has just been issued, Mr. Simon laments the present chaotic state of medical legislation and the difficulties in the way of effecting those reforms about which so much has now been written and said. He is very doubtful whether these difficulties will be surmounted in the course of the ensuing year, and, with regard to the formation of the one-portal system, he says that, if matters are not soon brought to a favourable termination, the College should give up all idea of conjoint action, and seek to perfect its own organisation independently of the other corporations. We should not wonder if the College acted upon the suggestion thrown out by Mr. Simon, for it has not only consented to great sacrifices in order to join in the proposed scheme of a Conjoint Examining Board, but has taken a very active part in making arrangements for the practical working of that system. Its patience and good intentions must now be almost worn out, but, should the conjoint scheme come to naught, the College will have the satisfaction of knowing that nothing was wanting on its part to bring about such a desirable reform.

Bloodless Tracheotomy.

W. W. Dawson, M.D., Professor of Surgery, Medical College of Ohio, strongly advocates the use of a blunt instrument for tearing through the subcutaneous tissues lying between the skin and trachea when performing this operation. By doing so all danger of hæmorrhage is avoided.

In making the skin incision he pinches up the integument in a fold, transfixes with the knife, and cuts outwards. For cutting through the trachea he uses a *curved double edged sharp-pointed bistoury;* with this he catches up the trachea as with a tenaculum, and finds less force necessary in its introduction than is the case with the ordinary knives, thus avoiding the danger of transfixing the wind-pipe. He advocates the skin incision to be made as high up as possible, and also a very free incision throughout tracheal rings.

In the course of his clinical lectures, he warned the

Digitized by Google

students that so far from this being one of the easiest and simplest operations in surgery, as might be inferred from the text-books, it is in reality one of the most trying, and one that requires great care and skill on the part of the operator. The following are his words, and will justify his judgment;—

"You imagine the case is simple, the neck long, the patient lean, and expect to find easy access to a superficial trachea. After dividing the integument you cut into the cellular tissue, and to your surprise and horror you find the trachea low down, and covered by a mass of veins, rendered thick, turgid, and almost varicose by impeded respiration. You cut, tie, and tear your way along, and when you hope to open into the trachea, find yourself at the bottom of a deep bloody well, with a constantly moving tube to open." Those who have performed this operation, or have been present at its performance will recognise the truth of the picture. He lays proper stress upon the necessity for the operator keeping strictly to the median line.

Speaking of his experience in connection with this operation, he says: "I have performed tracheotomy a great many times, have never lost a patient when I operated for foreign bodies, *and have never saved one when I operated for the difficulties attending croup and diphtheria.*"

Most certainly it is incumbent upon every one about to perform this operation to enter upon it with a mind duly impressed with the dangers and difficulties likely to be met with, and not with a rash confidence in the simplicity of the operation, as performed upon the dead body, his own skilfulness, or the likelihood of a successful result.

The Staats Examen.

At the meeting of the General Medical Council on Friday last Prof. Rolleston called attention to the Staats Examen of Germany and Austria and urged the introduction of a similar system of examination into this country. He pointed out that a comparison of the account given by Drs. Hermann Biegel and Bruce at p. 25, etc., of Appendix ii. of the General Medical Council's Report on Professional Education, 1869, with that published in 1876 by Billroth, of the German and Austrian Staats Examen, would show that no difference of importance as regards the duration of the Staats Examen has been introduced between the two dates. Hence, the inference that the system is productive of good results is natural and allowable, else material modification would have been found to be necessary. Some members of the Council seemed to consider the duration of the Staats Examen, which extends over four months, too severe a strain on the enduring powers of candidates. But the actual and continuous examination of the candidate does not proceed without a break, any more than the treatment of the hospital patient who is under his care for test purposes. Human nature could in neither case hold out under such a *tentamina physica*. But our readers will see that the German Staats Examen are examinations not only of students but also of teachers and teaching establishments. They are not only inspections of students but inspections of schools. Their duration may be carelessly spoken of as amounting to prolonged torture, but in reality it secures the students on the one side against unjust rejection, and the public, on the other, against ignorant or inefficiently qualified practitioners.

The New Irish University.

The profession is not very much concerned in the controvery which has arisen over the proposal of Lord Cairns to supersede the Queen's University by a new cosmopolitan institution which would embrace all comers without distinction of locality, religion, or nationality. In the abstract the scheme is obviously worthy of approval, for every one will admit that it is in the highest degree desirable to place university degrees within the unfettered grasp of all. But whether the new University will be good for the country or not will depend altogether upon the standard of education which it demands from its graduates. If it follows the example of the London University and guards with the utmost strictness the portals of the learned professions against the ingress of half-educated persons, then it will fulfil its avowed object in the encouragement of learning; but if, on the contrary, it purchases popularity and monetary independence by selling its degrees at a low educational price, then it would be better if the University had never existed. As to the course it will pursue in this matter we are bound to assume the best, but the Bill gives us no guarantee. The Governing Body may grant its degrees on what terms may—at their absolute discretion—please them, and it is possible that they may think it well to follow the lead already set them by one Irish University, and proceed to get graduates at any price, either by purchase or by cheap sale of degrees. The fear that this may be the policy of the new University seemed at first to be warranted by the terms of the Bill which in its 7th clause ran in the following words :—

"The charter shall provide that the University shall confer a degree upon every person who, having matriculated in the University, and complied with such conditions as to his subsequent education and the passing of such examinations as the senate may prescribe, satisfies the senate that he is qualified in point of learning to obtain the same. No residence in any college, *nor attendance at lectures, or any other course of instruction in the University shall be obligatory upon any candidate for a degree.*"

That University degrees in medicine or surgery should be issued without an hour's attendance of the candidate at hospital, or in any other place of study, appeared so daring, that the Council of the Irish College of Surgeons at once addressed to Lord Cairns a remonstrance against such a proposal, and apparently with good effect, for when the Bill was committed the Lord Chancellor moved to add the following words :—"Other than a degree in medicine or surgery." So far this concession relieves our minds, but we shall look with great anxiety to the terms of the Bill as it may be modified in the Commons, in the hope that we may find therein some assurance that the degrees in medicine of the University will be granted only upon the authority of a high-class education, and a stringent and thoroughly practical examination.

Dr. Acland, F.R.S., was unanimously re-elected President of the General Medical Council, on Friday last, for a further term of five years.

The New Charter of the Irish College of Physicians.

The bye-laws adopted by the King and Queen's College of Physicians to regulate the new grade of members, in accordance with the provisions of the Supplemental Charter of December, 1878, have been submitted, for approval, to the Lord-Lieutenant of Ireland. The members of the College alone are to be eligible to the fellowship, and are to enjoy certain privileges, but will not be members of the body corporate. All licentiates of the College admitted before December, 12, 1878, are entitled to be admitted members without payment or examination on complying with certain conditions. Every candidate for the membership must be twenty-five years of age; must be a licentiate of three years' standing of the College or of the Royal College of Physicians of London or Edinburgh; or a licentiate of one year's standing and a graduate of arts of a university in the United Kingdom; or a licentiate of one years' standing, and a registered practitioner of seven year's standing; and, of course, must produce satisfactory testimonials of good character, &c. Every candidate for examination will have to produce proofs of a certain degree of extended professional education, and will be required to translate into English a passage from a Latin author, or to show that he possesses a knowledge of Greek, or French, or German; and he will have to pass an examination in "pathology, medical anatomy, histology, medical chemistry, principles of public health, (including climatology and meteorology), psychology, forensic medicine, and clinical medicine."

An Operative Method to Combat Commencing Pyæmia.

H. Kraussold in v. Langenbeck's Archives, xxii, page 965, says (*Centralblatt, Cin. Lancet*)—"In a man, 29 years of age, at the Erlangen clinic, amputation was performed just above the knee-joint, on account of a badly united fracture complicated with an aneurism of the posterior tibial artery. Repeated and alarming hæmorrhage followed, and the manipulations necessary to control it in a manner destroyed the antiseptic precautions, so that on the fourth day pyæmia supervened with a chill. As the cause of the same was supposed to be a commencing suppurating thrombus of the vein, the latter was opened and a discoloured fluid along with the contents of a thrombus escaped. Immediately after this the vein was exposed to Poupart's ligament, ligated at two points, and the intervening part, from two to three centimetres in length, removed. The femoral artery was also ligated in order to guard against further hæmorrhage. The temperature of the body sank at once to the normal, and the patient recovered without further untoward symptoms. Ligation of the vein under similar circumstances, has been performed before with good results, and as soon as the diagnosis is established one should not hesitate to resort to it.

On reference to the proceedings of the General Medical Council in another column, it will be seen that the name of Adam Addison, who was recently convicted for procuring abortion, has been ordered to be struck off the Register.

Pilocarpine as a Remedy for Baldness.

It is announced by Dr. G. Schmitz (*Berl. Klin. Wochenschrift*, 27th January, 1879), that pilocarpine possesses, in a remarkable degree, the power of reproducing the hair on a bald surface, in certain instances at least. The cases on which this statement is based are as follows:—A man, 60 years of age, completely bald (with the exception of a few white hairs on the occiput), was operated upon for cataract. After the operation there remained in one of the pupils a fragment of membrane to cause the absorption of which the author administered, within a period of fourteen days, three subcutaneous injections of the muriate of pilocarpine. The membrane disappeared; but this was not all. At the same time the head became covered with a thick crop of hair, which grew so rapidly that at the end of four months no trace of baldness remained. The new hair was partly white and partly black. The second patient, aged 34, suffering from an affection of the retina, presented on the crown of his head a perfectly bare patch, as large as an ordinary playing card. Two injections of the same substance not only cured the ocular affection but produced an abundant growth of hair on the bald part of his head. Unfortunately, Dr. S. gives no information as to the nature or causes of the baldness in his two patients.

Decrease of Medical Practitioners in France.

The *Journal de la Société de Statistique*, giving the official statistical return of the number of all persons engaged in the medical profession during 1876, has just been published, and it is of interest to compare it with the official list for 1866:—

	1866.	1876.
Population . .	36,469,866	36,905,788
Doctors of medicine .	11,457	10,743
Officiers de santé .	5,582	3,633
Pharmaciens . .	5,726	6,232
Midwives . . .	12,314	12,847
Herborists . .	950	983

This diminution is not of recent date, for, taking account only of doctors and *officiers de santé* these numbered 18,099 in 1847, and 18,052 in 1853, while in 1866 their number was reduced to 17,039, and in 1876 was only 14,376.

A Counter-prescribing Prosecution.

Mr. Motteram, Q.C., Judge of the Birmingham County Court, gave judgment last week in the case of the Apothecaries' Company against Harrison, chemist, Birmingham. The action was brought to recover £20 damages, by way of penalty, under 55 Geo. III., cap. 194, sec. 20, against the defendant for prescribing medicine to one Julia Caddick, in November, 1876. The case had been postponed pending the decision in "Shepperley's case." The defendant took refuge under a proviso of the 28th section of the same Act, and counsel on his behalf contended that he had a right to prescribe medicine in a case like that under the notice of the Court. In giving judgment, Mr. Motteram said he found from the evidence that the defendant had clearly and unmistakably acted as an apothecary, and the proviso relied upon afforded, in his opinion, no defence in such a case as that. The verdict,

Digitized by Google

therefore, would be for the plaintiffs for £20 damages and costs.

Murder of a German Physician.

THREE months ago a very tragical and mysterious occurrence took place in Germany. D. Mulhäuser, a well-known physician, was murdered, as is supposed, by his own servant, who also lay dead at a short distance. There were traces of a struggle, and death had in both instances resulted from wounds inflicted by a knife. It is supposed that the servant man, who had been at one period confined as a lunatic, had been seized with an attack of homicidal mania, and after murdering his master had committed suicide. The whole affair is shrouded in impenetrable mystery, and, as may be supposed, has given rise to a great deal of gossip and speculation.

British Practitioners in Canada.

THE local medical authorities of Canada have hit upon an ingenious method of defeating the law which authorises all duly registered British practitioners to practise in the British Colonies.

At the late meeting of the Ontario Medical Council a bye-law was passed making a general registration fee of 400 dols. and granting a rebate of 350 dols. to Canadian graduates. This is intended to prevent British graduates and Canadian M.D.'s possessing British qualifications from practising in Canada, except on payment of a registration fee of 400 dols. The *Canadian Med. Journal* expresses great doubt whether such an arrangement will hold water, and believes it is *ultra vires*. The Act provides that all who have received their qualifications prior to the 1st of July, 1870, shall be admitted on payment of a registration fee of 10 dols., and no differential registration fee was contemplated.

"We would not," says our contemporary, "have alluded to this subject, as a matter of a very great moment, were it not for the fact that such a policy on the part of the Council is likely to destroy all hope of obtaining reciprocity in medical registration between Canada and the mother country."

A Well Deserved Reward.

AT a meeting of the Committee of Council of the British Medical Association, held on Wednesday, July 9th, Alfred Carpenter, M.D., President of the Council, in the chair, it was moved by Dr. Sieveking; seconded by Surgeon-General Maclean, and resolved unanimously—

"That in consideration of the extraordinary professional services rendered by Surgeon-Major James Henry Reynolds, M.B. Dub., V.C., at Rorke's Drift, Zululand, South Africa, on the 22nd and 23rd January, 1879, in his constant attention to the wounded under fire, in consideration of his eminent bravery in voluntarily conveying ammunition across an open space under a heavy cross fire, and also of the remarkable intelligence, coolness, and tact evinced by Surgeon-Major Reynolds under circumstances of great danger, the Gold Medal of the British Medical Association 'For Distinguished Merit,' be, and hereby is, awarded to him."

M. Koeberle's Ovariotomies.

M. KOEBERLE communicated to the Strasburg Medical Society the statistics of his recent ovariotomies. In 1878 he practised seventeen with only one fatal result. Besides these he had four other gastrotomies—viz., extirpation of a fibro-cystic tumour from the broad ligament, two extirpations of fibrous tumours of the uterus, and an exploratory incision in a case of hæmatocele followed by chronic peritonitis, the hæmatocele recurring six months afterwards, and being again treated successfully by exploratory puncture. Of these four cases only one proved fatal. During the last four years M. Koeberlé has practised 100 ovariotomies with eighty-nine recoveries and eleven deaths. He ascribes some influence on the results to his practice of cleansing the peritoneal cavity with carbolised water.

The Medical Acts Amendment Committee.

THE Parliamentary Committee, under the chairmanship of the Right Hon. Mr. Forster, is still sitting and taking evidence, but on account of the meeting of the General Medical Council, we are compelled to suspend our Reports. We left off in our last with the examination of Sir James Paget, and regret that the length of the proceedings of the Medical Council precludes our giving the evidence of Sir Dominic Corrigan, and other witnesses since examined. Readers will, however, have gathered the drift of the Committee, and the fears expressed in our last as to the chances of the measure passing this session are unfortunately more than justified by what we have subsequently learned.

MR. PATRICK JAMES MURRAY'S petition to be reinstated on the Register was, at the same meeting, refused. Mr. Murray has before appealed with a similar result.

WE are glad to announce that Dr. John Harley has been elected Physician to St. Thomas's Hospital *vice* Dr. Murchison, deceased.

THE Council of the Pharmaceutical Society of England has negatived a proposal to proceed against co-operative stores for infringement of the Pharmacy Act by the sale of poisons.

THE German Sanitary Association will meet in Stuttgart, September 15th-17th. The subjects to be discussed are—Rules for Disinfection; for Preventing Epidemics; Hygiene of Restaurants and Lodging Houses; Necessity of Mortuary Houses; Public Baths.

IF the weather is excessively wet and the temperature low, there is the consolation that such low death-rates were never before registered. Last week the rates of mortality per 1,000 in the principal large towns in the United Kingdom were—Oldham 13, Brighton 13, Sheffield 15, Portsmouth 15, Leeds 16, Nottingham 16, Norwich 17, Plymouth 17, Birmingham 17, London 17, Wolverhampton 17, Edinburgh 18, Liverpool 19, Salford 20, Sunderland 20, Manchester 20, Leicester 20, Bradford 20, Bristol 21, Hull 21, Dublin 23, Glasgow 22, and the highest rate 25 in Newcastle-upon-Tyne.

Digitized by Google

The American Laryngological Association Held its first annual meeting in New York last month, under very favourable auspices, Dr. Louis Elsberg, of New York, in the chair. A number of valuable papers were read and discussed every day. The St. Louis *Medical Journal* was adopted as the official organ of the Association, in the columns of which the Transactions will duly appear. New York was selected as the place of meeting, which occurs in 1880. The Association numbers some thirty-five members; admission to its fellowship requires the presentation of an original paper and the endorsement of its Council.

Mr. O'Donel, Dublin police magistrate, has fined a man, named Keating, £5, at the prosecution of the Public Health Commissioners, for holding a "wake" on the body of a child who died of small-pox. It was mentioned that a man was at the "wake" who had since died of small-pox.

The scheme of a woman's college undertaken by Holloway of the Pills, is making progress. Tenders have been invited and sent in for the erection of a block of buildings, the cost of which may be roughly estimated at £70,000. The whole expenditure contemplated is considerably in excess of half a million sterling, and we understand that the works are now to proceed without any further delay.

The abolition of the Customs duty on quinine was passed by the United States Legislature on July 1, and as a result, the *Chemist and Druggist* considers that the manufacture of the chemical in America is practically at an end. In anticipation of the inevitable American demand which this must occasion in Europe, a speculative movement has occurred in England which has occasioned a general advance in the market prices of all kinds.

In reference to our "Obituary" notice in last number, of the late Mr. C. F. Maunder, F.R.C.S., we have been informed, on good authority, that it was Mr. Louis Stromeyer Little, F.R.C.S., who was the first to employ the chisel instead of the saw in osteotomy. This case was operated by Mr. Little, at the London Hospital, in 1868, and was published in the Transactions of the Medico-Chirurgical Society two or three years later.

We believe that the present meeting of the General Medical Council is the shortest on record. The principal reason for its summons the second time this year, was to elect a president, as foreshadowed in Dr. Acland's inaugural address. It was essential, also, that an authoritative opinion on the action of the English College of Surgeons, as regards dentists, should be expressed, and this was done on Saturday, notwithstanding Mr. Simon's protest.

Compared with the favourable death-rate at present existing in London and other large cities in the United Kingdom, the following will be read with interest: The rates per 1,000 were—Calcutta 32, Bombay 32, Madras 27; Paris 21; Geneva 19; Brussels 27; Amsterdam 20, Rotterdam 32; The Hague 20; Copenhagen 22; Christiania 17; St. Petersburgh 39; Berlin 37, Hamburg 21, Dresden 26, Breslau 29, Munich 37, Buda-Pesth 36; Rome 23, Naples 26, Turin 26, Alexandria 36; New York 21, and Baltimore 27.

Last week the annual death-rate from the seven principal zymotic diseases averaged but 2·6 per 1,000 in the large towns, and ranged from 0·7 in Plymouth, to 3·5 in Sheffield, 4·1 in Bradford, and 4·5 in Bristol. Scarlet fever showed the largest proportional fatality in Newcastle-upon-Tyne and Sheffield; measles in Bradford and London; and whooping-cough in Bristol, Birmingham, and Sheffield. Small-pox caused 4 deaths in London, 8 in Dublin, but not one in any of the other large towns. The deaths referred to diarrhœa were but 54 last week, against 352, 223, and 433 in the corresponding weeks of the three years 1876-7-8.

Scotland.

(from our northern correspondent.)

Death of Dr. Maclaren.—Dr. Maclaren, of Johnstone, died on the morning of the 12th inst. The event has caused a very general feeling of regret throughout the whole district where Dr. Maclaren, during a long life-time, practised, and where he was held in universal respect and esteem. Dr. Maclaren was seized with illness during the middle of the previous week, and from the first, during his conscious moments, he expressed but little hope of his recovery. Dr. Maclaren was born in Paisley, and after completing his medical studies in Glasgow, settled in Johnstone. He was a successful student while in college, and carried off medals for midwifery and surgery. The deceased was a most genial, liveable man, and his society was greatly appreciated in social circles. He was a Justice of the Peace, and for a long period held the Government appointment as Factory-surgeon for the town.

A Medical Student charged with Murder.—An important trial has just been concluded at Glasgow. John McWhirtes, a medical student, was charged with the murder of his paramour, and acquitted on the dubious verdict of "Not proven." This trial has once again exhibited the too oft-repeated conflict of medical opinion. The responsibility of the medical witness can hardly be exaggerated in questions involving life and death; and it may safely be stated that dogmatism, on slender grounds, and cultivated reason stand in an inverse ratio. What estimate can we expect the public to form of "experts" who, on the one hand, assert that a woman "was subjected to much violence, and ultimately killed by strangulation, and further . . . that the process of strangulation was slow and protracted;" and, on the other, that "the woman had died primarily from alcoholic poisoning, but that in consequence of the presence of a ligature in the shape of a neckerchief round the neck, suffocation had also contributed to death." Surely the post-mortem appearances of death from alcohol, and death from strangulation are different. In this case the odour of alcohol remained, it is alleged by the reporters, in the contents of the stomach, thirty-two hours after death; and Dr. Littlejohn wisely remarks—"It is most remarkable that the medical inspectors should condescend on the special kind of alcohol." Exhibitions of this nature are not calculated to impress the public with a high sense of the value of medical testimony

Digitized by Google

and medical witnesses should primarily consider that minute inferences, while they may command the admiration of the vulgar, are sometimes difficult of reconciliation with serious science, and may involve disastrous consequences to a guiltless individual.

GLASGOW ROYAL INFIRMARY.—STAFF "VACANCIES."—An advertisement appears at present in the newspapers stating that a physician and surgeon of this institution retire shortly in the course of the usual rotation, and inviting applications from candidates for these appointments. These advertisements, occuring as they do yearly, at this time demand a passing notice. Dr. J. G. Fleming was instrumental a few years ago, in modifying the old regulations as to medical appointments in the following manner :—After a term of eight years a physician and surgeon retire, but he is eligible for re-election, *ad vitam*. It was at first thought that these invitations to the profession to make application for the offices falling "vacant" were really serious ; but experience has shown that the physician and surgeon who thus "retire" are invariably re-elected, application may be made for the office, but no notice is taken of it. The farce is thus yearly performed, and our infirmary appointments are invariably life ones, much to the injury of the profession and the public. There is one man, however, in the subordinate grades for whom a struggle will doubtless be made, and some one sacrificed.

GREENOCK.—THE ADMINISTRATION OF THE FERGUSON EYE BEQUEST.—A scheme has been prepared and lodged in the Court of Session by the Provost and magistrates of Greenock for the management of the bequest left by the late James Ferguson, merchant and sugar refiner, Greenock. The trustees are to be Robert Steel Macmorland, sole surviving trustee ; and John Bain, nephew of the testator ; the Provost, and two senior bailies of Greenock ; and the Chairman, Deputy-chairman, and Secretary of the Greenock Hospital and Infirmary. The appointment of the oculist is to be vested in the Provost and magistrates. The directors of the infirmary are to provide an apartment in that institution to be used as an eye dispensary, at which the oculist shall attend and prescribe for applicants desiring treatment. The capital fund forming the bequest, shall consist of £7,300, and interest at the date of approval of the scheme, under deduction of legacy duty and expenses incurred by the Provost and magistrates, and directors of the infirmary in the action against the judicial factor of the late Robert Ferguson. The scheme also deals with the investment of the funds and other matters.

THE HIGH DEATH-RATE OF PAISLEY.—The high death-rate of Paisley, having attracted the attention of the Board of Supervision, a communication from that body was recently addressed to the Board of Police on the subject. The Board, it was stated, had observed from the Registrar-General's Returns that the rate of mortality in the town was unusually high, and they had to call on the local authority for any observations they might desire to offer on the subject, with reports from the sanitary and medical officers, with special reference to the town's water supply, the drainage system, and any public nuisance. The result of the information elicited went to show that there was an abundant water supply of excellent quality ; as to drainage they had just issued notices regarding the formation of a new scheme, and there was no evidence of any public nuisance.

HEALTH OF EDINBURGH.—During the week ending the 12th inst. there were 77 deaths, and the rate of mortality was 18 per 1,000. The zymotic mortality was lower than it has been during the previous year, no death having been reported in the New Town or Southern suburbs.

DEATH-RATE OF GLASGOW.—The deaths in Glasgow for the week ending the 12th of July were at the rate of 23 per 1,000 per annum, against 19 in the preceding week, and 20, 19, and 17 in the corresponding weeks of 1878, 1877, and 1876.

REGISTRAR-GENERAL'S RETURN FOR JUNE.—The Registrar-General's monthly return of births, deaths, and marriages registered in the eight municipal towns in Scotland says that during the month of June there were registered the births of 3,657 children, of whom 1,838 were males, and 1,819 females. Of these 3,348 were legitimate, and 309 illegitimate, being in the proportion of 1 illegitimate in 11·8 births, or the illegitimate births constituted 8·4 per cent. of the whole. The deaths of 2,097 person were recorded in the eight towns during June, of whom 1,075 were males, and 1,022 females. This is also the smallest number of deaths recorded during June since 1867, and, if increase of population be allowed for, is 544 under the average for the month during the last ten years. The miasmatic order of the zymotic (epidemic and contagious) class of diseases proved fatal to 285 persons, constituting 13·7 per cent of the whole mortality. This rate was considerably exceeded in Paisley, where measles, scarlatina, and whooping-cough were prevalent. Fever caused 33 deaths, of which 17 were tabulated as typhus, 14 as enteric, and 2 as simple continued fever. Whooping-cough caused 80 deaths, being a decrease of 33 on the number recorded during May. One very interesting fact was to be noted, viz., that of the deaths of last year 88 were of persons sent into the hospitals from the districts outwith the burgh.

Literature.

SURGERY, ITS PRINCIPLES AND PRACTICE. (a)

In this, the second edition of the "Principles and Practice of Surgery," the author has taken great pains to bring it up to the present state of our knowledge. Whilst giving him our thanks for the benefit he has conferred on the profession by presenting it with so admirable a treatise, we cannot bestow unqualified praise on every section of the work.

The author, in his preface, condemns the "diagramatic style" of illustration, but we fail to see the advantage possessed by such drawings as those representing "A Blood-clot between the Dura Mater and the Skull," "A Cyst from the Arachnoid," and "Fracture of the Cartilages of the Larynx over those pourtraying the Anatomy of Mellities Ossium," after Billroth, and the "Operation of Lithotrity," from Thompson. It is better to give a definite idea of what is intended to be conveyed, even though it be diagrammatic in form, than to leave the reader with an anatomical or pathological puzzle, only to be unravelled by a perusal of the text.

The chapter on Accidents is, in general, fully and carefully written, but we should take exception to the statement that after trephining it is *easy* to secure the middle meningeal artery, since we believe that frequently it is very difficult, from the fact that it is usually torn from the groove in the bone, and carried onwards with the dura mater.

In the treatment of fracture of the clavicle we had hoped to have seen mentioned the plan adopted by Sayre, which is at once simple, elegant, and efficient. The description of fracture of the spine is especially worthy of commendation, as is also that of meningocele, of scrofulosis, and of aneurism ; but of all the diseases treated of, none presents so many excellencies, and though not uncombined with deficiencies, as found in the account of those of the genito-urinary organs. Stricture of the urethra is handled in a masterly manner, and

(a) "Surgery : its Principles and Practice." By T. Holmes, F.R.C.S. London : Smith, Elder, and Co.

Digitized by Google

leaves nothing to be desired. The pathology of surgical kidney is less fortunate, however, for we are left quite in the dark both as to the seat of the thrombosis of the veins, and the real nature of the changes in the organ (interstitial nephritis).

We should have preferred in these days of advanced chemical notation, to have seen a different formula for urea, nor do we quite grasp the meaning of the repeated phrase "inflamed urine."

The treatment of orchitis is very ably discussed, and we congratulate the author on his successful refutation of the theory supporting the barbarous practice of puncture of the gland.

A somewhat fuller account of the accidents connected with lithotomy would have been acceptable. As to the relative frequency of the different malignant tumours of the bladder, since the point is somewhat doubtful, we may excuse the assertion that encephaloid cancer takes the lead in opposition to the generally-received opinion that epithelioma holds first place.

A distinct step in advance is made in the description of the relative positions of phlebitis and thrombosis, and this might advantageously have been followed up by banishing the terms "tumour" and "new growth," as applied to syphilitic gumma. In a subsequent edition we shall look for more definite information on the comparative frequency of primary cancer and sarcoma of bone, and the use of the terms medullary and encephaloid in a more restricted sense. A short account of the anatomical explanation of the greater frequency of intussusception of the bowel in children than adults would enhance the value of the present text.

We have dealt somewhat freely with what seemed to us to be defects in this justly esteemed work, defects, though small, thrown all the more into relief by the excellence of the general surroundings. The style of the writing is *sui generis*—clear, concise, classical, a model for future authors. Altogether, we do not hesitate to state that it is about the safest book to put into the hands of the student, and the most useful for the busy practitioner.

DR. ROBERTS'S PRACTICE OF MIDWIFERY. (a)

We had not the opportunity of reviewing the first edition of this book, and therefore we shall regard it as a new acquaintance. That a second edition of it has been so soon called for is not to be wondered at, considering that it forms a part of the admirable series of "Student's Guides," published by Messrs. J. and A. Churchill. A student's text-book of midwifery should, beyond all other books of the kind, be concise and practical. Obstetrical medicine is so essentially practical, that the less the student troubles himself with the literature and theoretical details of that science, the better. He requires just so much book knowledge as will instruct him in the general principles of the obstetric art, guide him in his practice, and prevent him from making mistakes that might be committed by one totally unacquainted with the subject. Dr. Roberts's manual supplies these desiderata in every respect. It is concise, clear, and practical, and while taking due notice of the more recent improvements and doctrines in midwifery, does not attach too much importance to new practices just because they are novel and supported by high authorities. Thus he discusses the treatment of placenta prævia with great judgment. He is not, in these cases, very favourable to the extraction or separation of the placenta according to the respective recommendations of Bradford and Barnes; and he gives the student clearly to understand that "version is the accepted treatment in the great majority of placental presentations." The balance of opinion tends to limit these operations to cases where the exhaustion of the mother is too great to admit of turning, &c.

His sound and practical advice may also be illustrated by his chapter on the treatment of puerperal convulsions. While strongly insisting upon the good effects of administering chloroform and chloral hydrate, he admits there are cases in which the "question of depletion ought not to be dismissed without due consideration." The following is a characteristic extract from this chapter. "To epitomise the treatment (constitutional): After attending to any special condition, as extreme cephalic congestion or alvine constipation, place the patient completely under the influence of an anæsthetic to the extent of entirely suspending voluntary muscular movement, and so to remove pressure from the vascular system. If necessary, the anæsthetic condition may be maintained for hours, until delivery is accomplished or the nerve-storm has passed away."

If we had to suggest any improvement in future editions of this little work, it would be that more consideration was given to the operations of midwifery and to the diseases incidental to parturition, and less to the purely physiological parts of the subject. Nearly a third of the work is devoted to subjects that have chiefly an anatomical or physiological interest; and although the same may be said of all other works on midwifery, we do not see why questions which properly belong to the domain of the physiologist should be too conspicuously obtruded upon the young accoucheur. With this exception, which can scarcely be called a fault, we regard the book as one of the most concise, readable, and trustworthy guides the student can have on the subject.

ESSAYS ON THE TREATMENT OF DEFORMITIES OF THE BODY. (a)

When a specialist announces that he is preparing an essay, or a series of essays, on the subjects with which he is supposed to be particularly familiar, the medical public are justified in expecting to be apprised of new and original ideas. But in the case of the "Essay" now before us we must confess to be greatly disappointed. Mr. Fisher tells us nothing new, and nearly all that is valuable we have already seen in Dr. Sayre's well-known book on "Spinal Disease." "Some modifications of Sayre's plan," writes the essayist (p. 21), "have been introduced; of these the only one of practical importance is the employment of the poro-plastic felt as a material for making the jacket, in lieu of the plaster of Paris." Mr. Fisher says nothing of Dr. Walker's important modification of the plaster of Paris treatment by the many-tailed bandage, applied whilst the patient is in the recumbent posture, nor does he allude to the fact that some surgeons have questioned the need of suspension in applying rigid jackets. An essayist should at least pass in review such important departures from a generally accepted doctrine. If Mr. Fisher should carry out his intention of issuing a series of essays, it is to be hoped that the rest will be of a higher stamp than that on the treatment of *Pott's Disease*, otherwise we would venture to suggest that Mr. Fisher consider whether it is advisable for him to publish them.

THE IRISH COLLEGE OF SURGEONS AND THE MEDICAL COUNCIL.

We report to-day, in our narrative of the proceedings of the General Medical Council, a somewhat amusing effervescence of virtuous indignation on the part of the Council against the Irish College of Surgeons, which it is worth while to explain, lest the language of some of the speakers may beget a false impression that the College has been guilty of some misdemeanour deserving of the denunciatory agonies of the Council orators. The facts are these: At the last meeting of the Council a letter was read from a Mr. Bunbury Eames, who complained that he had been refused admission to examination in Glasgow because he had not fulfilled four years of medical study *subsequent to his preliminary examination*. This gentleman had been educated in Dublin, and had—for reasons which he himself understands—elected to qualify in Glasgow, and his complaint was that the Irish College of Sur-

(a) "Essays on the Treatment of Deformities of the Body.—1. The Treatment of Pott's Disease; or Angular Deformity of the Spine." By Frederic R. Fisher, F.R.C.S. London: J. & A. Churchill. 1879.

Digitized by Google

geons did not comply with the recommendation of the General Medical Council, which advised that a student's curriculum of study should not commence to count until he had passed his preliminary, and been registered. We heartily approve of that recommendation, and only regret that the Conncil had not the strength of mind to make it an order binding upon licensing bodies. It happens, however, that they did not do so, and that the Irish College of Surgeons, in company with seven others out of the nineteen licensing bodies, ignored it, and permitted the student to pass his preliminary at any time before his first professional examination. In Ireland only one body, *i.e.*, the Apothecaries' Hall, deserves the credit of insisting on the precedence of the preliminary, and in Scotland several bodies disregard the recommendation.

Possibly, Dr. Andrew Wood, whose feelings appeared to have loosened his tongue, was unaware of this fact, and we may, therefore, do well to inform him and the Council that, the Irish College of Surgeons was prevented acting upon the recommendation, simply because to do so, in the absence of uniformity of system in other bodies, would he to throw the great majority of the students into the embrace of other colleges. If the Medical Council had done its duty by enforcing this "recommendation," the Irish College of Surgeons would have been glad to co-operate.

Correspondence.

CROUP AND DIPHTHERIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—It has been suggested that I should make some further reply to Dr. Semple. I have really little to add to my former statements. I quoted a passage, and drew an inference from it: he disputed my inference and quoted another passage. But the point raised in no way affects the views propounded in my article on Croup and Diphtheria, published in your issue for June 4, and it hardly seems to me worth discussing. My opinions on the debate at the Royal Medical and Chirurgical Society, stated in the article allnded to, are not in the least affected by the allusion I made to the Academy of Medicine of Florence. It is right, however, to say that I did not quote from memory, but from a version made at the time for another purpose.

I am, &c.,

PROSSER JAMES.

3 Dean Street, Park Lane, W.

THE SPERMATORRHŒA TRADE IN AUSTRALIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I observe in your issue of the 9th inst., an extract from the *Australian Medical Journal*, having reference to the resignation of Dr. Blair as a member of the Medical Society of Victoria, in which the following is stated:—"Dr. Blair, it appears, was placed in charge of the practice of Mr. J. G. Beaney during that gentleman's absence in Europe, that fact being notified to the general public by advertisements and circulars."

I have to say with regard to this, 1st. That I left no one in charge of my practice, but on the contrary told my patients they might use their own judgment as to whom they should consult. 2nd. That I am innocent of the advertisements and circulars referred to; and if such were issued it was done without my knowledge or consent. 3rd. That my house, since I left, has been uninhabitable, being in the hands of painters, decorators, &c., and only occupied in part by my coachman and his wife.

I have hitherto refrained from noticing the many aspersions (by inuendo) on my character since I left Australia, knowing the source from which they emanated. Now, however, that a direct charge has been made, I deem it my duty to give it a most emphatic denial. Trusting that your sense of propriety and professional etiquette will cause this letter to be inserted in the next issue of your journal.

I am, &c.,

JAMES GEORGE BEANEY,
Surgeon to the Melbourne General Hospital.

Shelborne Hotel, July 14, 1879.

[We willingly insert Mr. Beaney's repudiation, but we may be excused for having identified our correspondent with Dr. Blair, considering that before Mr. Beaney left Australia, Dr. Blair had already issued broadcast a circular (of which we have a copy), which stated that "during Mr. Beaney's absence his patients will be attended by Dr. Blair." Additional probability attached to this statement from the fact, that when the Medical Society of Victoria—after Mr. Beaney's dinner in Dublin had become public property in Melbourne—held a special meeting for the purpose of publicly repudiating Mr. Beaney, as in any way representing the profession of that colony in the mother country, Dr. Blair was the only active champion of that gentleman present on the occasion, and was removed by force for misconducting himself. It was somewhat remarkable that we should be the first to make Mr. Beaney aware of the existence of Dr. Blair's circulars, especially as they appear to have been issued while Mr. Beaney was yet in Australia.—Ed. M. P. & C.]

Medico-Parliamentary.

HOUSE OF COMMONS—FRIDAY, JULY 18TH.

ARMY MEDICAL DEPARTMENT.

REPLYING to Mr. C. BROWN,

Colonel STANLEY said the usual notice had been given that candidates for the Army Medical Department should come forward for examination in August. He hoped that by that time the new warrant which was under the consideration of the Treasury, and which in substance carried out a good many of the recommendations of the Medical Committee of last year, would have been issued. If that were not the case the examination would, of course, take place under the old warrant.

PUBLIC HEALTH (IRELAND) ACT.

This Act as amended, passed the second reading in the House of Commons on Friday, July 18th.

SURGEONS OF IRISH JAILS.

Mr. BRUEN—I beg to ask the Chief Secretary for Ireland whether the surgeons of jails in Ireland who were appointed by Boards of Superintendence, and who have performed the duties of their office before and since the 1st day of April, 1878, are recognised by Her Majesty's Government as "officers attached to prisons" within the meaning of s. 27 of "The General Prisons (Ireland) Act, 1877;" whether surgeons not so appointed, but obliged as surgeons of infirmaries to perform medical duties in jails, and who have performed them before and since the 1st day of April, 1878, are so recognised? And whether any salary will be paid to prison medical officers for duties performed from the 1st day of April, 1878, to the present time; and if so, whether he will lay upon the table of the House a scale of the salaries to be paid for the performance of these duties?

Mr. LOWTHER—Yes, Sir, the surgeons referred to are recognised as "officers attached to prisons," and in addition I may say that the scale of salaries proposed will shortly be laid on the table of the House.

Mr. ERRINGTON—I beg to ask the Chief Secretary for Ireland whether a memorial was presented to the Irish

Digitized by Google

Government from the Irish College of Physicians protesting in the interests of the medical profession against the proposed amalgamation of the offices of surgeon and compounder in the Irish jails, and whether in spite of this memorial and of the strong feeling on the subject among the prison surgeons themselves it is still intended to combine the two offices?

Mr. LOWTHER—Sir, the memorial referred to by the hon. gentleman has been received. The intention, however, was not to make the amalgamation compulsory in the case of existing officers, but with regard to future appointments.

Medical News.

King and Queen's College of Physicians.—At the July examinations the following obtained the licenses in Medicine and Midwifery:—

MEDICINE.—Henry Banks, Arthur England Johnson Croly, Peter Reynolds D'Alton, William Dugdale, Thomas Fitzpatrick, Murray Mackenzie, Edward Patrick Meagher, Edward Morrisy, Charles Joseph O'Connor, William Henry Ogden, Bernard Reddy, Edmund Shackleton, Henry Lawrence Esmond-White, Vincent White, Wm. Owen Wolseley, George Harrison Younge.

MIDWIFERY.—John William Byers, Peter Reynolds D'Alton, John Singleton Darling, Constantine Richard Egan, Thomas Fitzpatrick, Charles Magill, Charles Joseph O'Connor, Bernard Reddy, Edmund Shackleton, Henry Lawrence Esmond-White, Vincent White, Wm. Owen Wolsely, George Harrison Younge.

Society of Medical Officers of Health.—At the annual meeting held on July 9, the following officers were elected for the ensuing year:—President: Dr. J. S. Bristowe. Vice-presidents: Mr. J. Liddle, Dr. G. Buchanan, Dr. T. Stevenson, Dr. C. O. Baylis, Dr. W. G. Corfield. Treasurer: Dr. J. W. Tripe. Secretaries: Dr. J. N. Vinen, Mr. S. F. Murphy. Council (metropolitan members): Mr. G. P. Bate, Mr. F. M. Carver, Dr. T. O. Dudfield, Mr. H. Leach, Mr. S. R. Lovett, Dr. J. Stevenson; (extra metropolitan members), Dr. J. Adams, Dr. F. T. Bond, Dr. G. W. Child, Dr. A. Hill, Mr. E. L. Jacob, Dr. R. P. B. Taaffe.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," 'Old Subscriber," &c. Much confusion will be spared by attention to this rule.

DR. GRIFFITH.—We will endeavour to find room for your paper in our next. Proof will be sent in the ordinary course.

NAVAL APPOINTMENTS.—The next examination of candidates for commissions in the Medical Department of the Royal Navy is fixed for the 11th August at the University of London. Candidates must present themselves on the 7th August.

MR. HETLEY.—The diploma is not of the slightest value in this country: it will not enable you to sign a death certificate legally.

F.R.C.S.—Not so easy as it appears. Try again.

AN INTERESTED ONE will find his question answered on reference to our Reports of the Proceedings of the Medical Council in another column.

DR. W. H. PEARSE.—Communication "On the Geography of Devonshire and Consumption" is marked for insertion in August.

PROFESSIONAL HONOUR.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—The statements appearing in your issue of July 9th, signed "Honesty" are, without exception, untrue, and therefore call for refutation on my part.

For the purpose of exposing the cunning manner in which he has sought to misrepresent the matter, I will deal with the two charges he wishes to prefer against me, and as briefly as possible.

"That I refused to pay him is nothing less than an untruth, as I offered him payment in presence of two other gentlemen, though he refused, being a little excited by a dispute we had, and he left, saying he'd make it £3 3s. now."

Every word in that sentence is a deliberate misstatement of what did occur. I never said I would make it £3 3s. A police-constable is one of the gentlemen referred to, and he was present for the purpose of assisting a commutation and to aid this gentleman in establishing a counter-claim to the £2 2s. owing to me. What can you expect from a gentleman who had a police-constable in his dispensary room to meet me and to take part in proceedings of a professional nature? Are you surprised at his striking a *hard and fast* bargain with me in presence of the chairman and others, as related to you in a previous communication?

Of course I left a "little excited," and need I add thoroughly disgusted, and, indeed, irritated also. I deny that I promised my votes to him. How very likely, and myself a candidate.

Every statement made in my former letter is perfectly correct. I now decline further correspondence with this gentleman on the subject. The public here are fully aware of our relative merits.

Faithfully yours,

PROFESSIONAL HONOUR.

[We think it better not to pursue this correspondence further.—ED. M. P. & C.]

DR. P.—It is the usual thing for a person who draws attention to abuses or irregularities to be charged with animus or interested motives; we were therefore not at all surprised to see the letter in the local paper you kindly sent us.

DR. ELLIOTT.—Received and will be considered.

RENDERING DAMAGED HAY PALATABLE AND NUTRITIOUS.—To those of our readers who boast a hay-field the following note from the *Journal of Horticulture* of Saturday last will be of interest:—"Every device which practical intelligence can turn to account has been adopted to secure the hay crop, yet when the weather proves adverse really good hay cannot be made. It then becomes a question what is the best course to pursue after the hay has been washed and discoloured by rain, and which has lost its aroma peculiar to good hay when well secured. To spice hay as it is stacked certainly tends to improve not only hay damaged by rain but also hay made from inferior pastures, where the herbage is naturally sour and coarse. The superiority of spice as compared with salt is, that it gives the hay an attractive smell as well as an improved flavour, and yet the cost is not more than 2s. 6d. per ton if Simpson's spice is used. We have abundance of evidence from practical farmers with whom we are acquainted that its use has in past seasons not only been advantageous generally, but has surpassed their expectations as to the way in which cattle and sheep have eaten the hay and made good proof upon it."

T. CAHILL.—The suggestion does not seem sufficiently practical for publication.

W. MCC.—The licence of the Dublin Apothecaries' Hall is recognised by the Medical Council as a legal qualification to practice medicine and the allied branches of the profession. We have never said anything to the contrary.

VACANCIES.

Billericay.—Medical Officer of Health for the Western District. Salary, £60. Also for the Eastern District. Salary, £50. Applications to the Clerk at Brentwood, Essex, before July 29.

Carrick-on-Suir Union, Piltown Dispensary.—Medical Officer. Salary, £100, with fees, and Sanitary Salary.

East Ward.—Medical Officer for the Brough District of the East Ward Union. Salary, £20, with the usual extra fees. Applications to the Clerk of the Union at Appleby by July 26.

Liverpool Northern Hospital.—House Physician. Salary, £80, with board, &c. Applications to the Chairman by July 24.

Shillelagh Union, Coolattin and Clonegal Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, July 25

Shillelagh Union, Hacketstown Dispensary.—Medical Officer. Salary, £100, with fees, and Sanitary Salary.

Victoria Hospital for Children, Chelsea.—House Surgeon. Salary, £50, with board, &c. Applications to the Secretary by July 16.

West London Hospital.—Assistant Surgeon on the Staff. Honorary. Applications to be sent to the Secretary before July 25.

Births.

HAYES.—On July 12, at 29 Westland Row, Dublin, the wife of P. J. Hayes, L.R.C.S.I., of a son.

MORTON.—On July 8, at Nenagh, co. Tipperary, the wife of R. Morton, M.B., of a daughter.

O'FLYNN.—On July 7, at Lismore, co. Waterford, the wife of Philip O'Flynn, L.R.C.S.E., of a daughter.

PHILPOT.—On July 20, at Cirencester, the wife of Harvey J. Philpot, L.R.C.P., of a son.

RENDALL.—On July 17, at Maiden Newton, Dorset, the wife of William Rendall, of a son.

STARKEY.—On July 17, at 7 Charleston Avenue, Rathmines, the wife of Wm. Starkey, M.D., of a son.

Deaths.

BARKER.—On July 17, at Monkstown, co. Dublin, Frederick Houghton Barker, second son of Frederick Charles Barker, M.D., Medical Department, Bombay Army.

KELSALL.—On July 6, at Dakka, Affghanistan, Henry Kelsall, M.R.C.S.E., Surgeon-Major, 1st Division Royal Horse Artillery, aged 47.

MACLAREN.—On July 12, at Johnstone, Renfrewshire, Malcolm Maclaren, L.F.P.S.G.

O'MEARA.—At Tramore, co. Waterford, M. A. O'Meara, L.R.C.S.I., Medical Officer Piltown Dispensary.

SARGANT.—On July 12, at Bletchingley, Surrey, William Henry Sargant, L.S.A.L., aged 72.

TERRY.—On July 3, on board the P. and O. Steamship *Lombardy*, Septimus Terry, L.R.C.P.L., Staff-Surgeon, aged 40.

TOLER.—On July 16, at 24 Rutland Square, co. Dublin, John Graham, only son of John Toler, M.B., T.C.D., F.R.C.S.I.

WOOD.—On July 7, at Albany Street, Edinburgh, Andrew Wood, Surgeon, formerly of the Bengal Artillery, aged 83.

THE DIPHTHERIA OUTBREAK OF LAST SPRING IN N.W. LONDON. (a)

By T. MORTON, M.D. Lond., &c.

(*Concluded from page* 61.)

Is there a mild, a simple, a common membranous sore throat, distinct from slight diphtheria? Trousseau distinguishes such a disease, but his distinctions are rather shadowy, and he is obliged to admit that such cases may turn to diphtheria; that is, may have diphtheria grafted on to them, as he not over ingenuously explains it.

I do not pretend to answer the question. I will only say that the epidemic of last year made me familiar with cases which I could not doubt, from their associations, were expressions of true diphtheria, but which at any other time I should have treated very lightly, and certainly made no attempt to isolate.

We sadly want more light on this subject, and it might be of the utmost value in checking the spread of the disease.

The other diseases, the question of whose relations to diphtheria is interesting, are scarlatina and croup.

Upon the latter I do not propose to touch further than simply to state the opinion to which my opportunities, such as they have been in a large mixed practice, have led me.

I adhere very decidedly to the views—now, if I mistake not, becoming very generally adopted—which had long been grasped by the French, and which are associated here, through recent controversies, with the name of Dr. George Johnson more perhaps than of any one else. I have no doubt in my own mind that there has been one name in England for two distinct things, and that while the majority of fatal cases of croup are laryngeal diphtheria, the majority of cases are catarrhal laryngitis, which may well be fatal, too, especially if either neglected or too actively treated, but of which the great majority get well. Such attacks have a tendency to recur in the same child, which is the obverse side of the old woman's saying, that if a child has croup three times it will never die of it.

Diphtheria and scarlatina were not distinguished from one another in the death returns until the year 1860, and it is not difficult to see the reason. Few people now doubt that diphtheria, as we have seen it in this country since 1857, is a new, or, at least, a renewed, importation from the Continent; but it naturally took some time to recognise this, and though typical cases of the two diseases are distinct enough, there are not a few which are very confusing. The rash of scarlatina, as we all know, may be absent, and that in cases where the throat symptoms are the most severe; and I now fully recognise that there are cases of diphtheria, especially in certain epidemics, in which there is a rash not distinguishable from that of scarlatina. Clearly we must either admit that such a rash may be one of the symptoms of diphtheria, or a distinct false membrane one of those of scarlatina, or that cases in which it occurs are hybrids of the two diseases, just as Rötheln perhaps is a hybrid of measles and scarlatina.

The question is relevant to another point which, strange to say, does not seem yet to be quite made out, namely, whether or not an attack of diphtheria confers an immunity for the future.

Of course, if diphtheria is really capable of uniting with scarlatina to form a hybrid, it must almost certainly be a specific fever, and will behave accordingly. But this is, of course, the merest speculation. The most profitable way of stating the proposition is the converse; that if diphtheria be found at all commonly to recur in persons who have once had it, it can hardly be a specific fever, but must be relegated to another class in the company of such diseases as influenza and cholera. In this form the question is capable of solution by a sufficient accumulation of facts, which must, however, be very extensive to prove it in the negative. I have never seen an undoubted second attack, but I am cognisant of more than one. We have all of us seen second attacks of measles and scarlatina, and some of us of small-pox, and

Digitized by Google

if second attacks should prove to be more common in diphtheria than in these diseases, it may after all be only a difference in degree, and not in kind.

The same question, of the essential nature of diphtheria, underlies the next and last point on which I shall touch. And here again theory closely touches practice. How far are we to regard the diptheritic membrane as the result of a direct morbid stimulus applied to the mucous membrane of the throat, like, for instance, the vaccine pustule or the chancre; or is it rather a specific exudation, like the cutaneous one of small-pox, or the mucous one of typhoid?

Upon our views with regard to this will greatly depend the relative value we shall be disposed to assign to local and to general treatment, or at least our practice with regard to the employment of energetic local applications designed to prevent the spread of the membrane.

This practice, to which the name of Trousseau long lent such irresistible weight, seems of late rather to be falling into abeyance, and I think rightly so, both on theoretical and practical grounds. I have never seen any good—and I believe I have seen much harm—from the vigorous application of caustics, and I do not think local applications can do much more than promote the somewhat earlier detachment of the membranes, and modify their foulness in their later stages.

ARSENIC AND ARSENICAL DOMESTIC POISONING.

By JABEZ HOGG,

Consulting Surgeon to the Royal Westminister Ophthalmic Hospital, and the North-West Hospital for Women and Children.

(*Continued from page* 62.)

The Symptoms of Arsenical-dust Poisoning.—The special symptoms of chronic poisoning produced by the introduction of arsenical pigments into our domestic manufactures, are as follows: The earliest indication of the absorption of the poison, that most frequently observed, is an excessive irritation of the whole of the mucous tract, and which is nearly always referred to a catarrhal attack. If any improvement follows the use of ordinary remedies in such a case, it is of a temporary nature; more frequently as the nasal irritation subsides, a feeling of faintness, sickness, headache, and great prostration supervenes. The patient improves in the course of the day, and tries to believe that he is not so very ill after all, although the next day he may be obliged to lay up. In other patients the first symptoms of poisoning are dyspepsia, stomach derangement, and cramp; these are referred to a bilious attack. A person sleeping in a room newly-papered, will have a severe attack of diarrhœa or sickness; awake unrefreshed, and complaining of headache, sore throat, smarting and running of the eyes, &c. It has frequently been noticed that breathing the air of a room impregnated with arsenical dust, after the servant or nurse has been dusting the room and moving about, an aggravated form of hay-fever, spasmodic asthma, or bronchitis, is experienced. In other instances, fainting fits, irritative fever, heart disease, vomiting, diarrhœa, nervous prostration, skin-eruptions, conjunctivitis, "hot eye," dimness of sight, paralysis, &c., follow in regular sequence.

The following symptoms may be enumerated as having been amongst those observed in connection with cases of wall-paper poisoning: violent fits of sneezing, lachrymation, sore-throat, short dry cough, difficulty of breathing, asthma, bronchitis, fainting fits, irregularity of the heart's action, constant headache, nausea, vomiting, diarrhœa, excessive thirst, eruptions and ulcerations of the skin, inflammation of the eye, nervous depression, general debility, prostration, cramps, colic, palsy, paralysis of the extremities, coma, death. In short, I believe that when arsenical dust poisoning comes to be thoroughly investigated it will be found that the danger to public health is quite as great as that arising from sewer gas, or impure drinking water. Many of the earliest symptoms of poisoning are shrouded in mystery, and, consequently, for every case of chronic poisoning made known, hundreds possibly pass unnoticed or unrecognised. It is, I should think, scarcely possible to adduce stronger proof, or a more well-marked example of cause and effect, than that observed on the removal of the patient from a room or house, suffering from an alarming form of illness, when an almost magical cure follows. A large number of cases, vouched for on unimpeachable authority, have been made public, and it is impossible to resist the accumulated amount of evidence of arsenical poisoning. A few instances will suffice to show this—a member of Parliament was known to suffer for months from a painful eruption of the feet, the symptoms were severe, and confined him to the house and the couch. At length the disease was clearly traced to the fashionable socks he was wearing; on abandoning which he quickly recovered. Several Californian miners actually died from wearing boots lined with a bright green flannel; the colouring matter was Scheele's green. A strong, healthy-looking tradesman suffered intensely from wearing a bright maroon flannel shirt next his skin. Poisoning has been known to occur from wearing paper collars, glazed and stiffened with size white lead, and containing arsenical pigment; from coloured calico shirts, from gloves, coat-sleeve and hat linings. A lady suffered from a painful form of skin disease, from constantly carrying about a yellow purse in her hand, whilst another suffered from the dye which came off a black crape dress she was wearing. Five or six members of a family were made severely ill by the chintz window curtains, and the bed furniture of the rooms in which they slept. Another family from green Venetian blinds, from which, during the heat of summer, arsenic was given off. A lady suffered many weeks from a troublesome eruption of the skin of the head from wearing artificial flowers in her cap and bonnet. Illness in a number of young children was brought about by the cloth lining of perambulators; eye diseases in a number of compositors from the green gas-shades distributed about the composing room. The distemper colour on the walls has been known to seriously affect the health of the office clerks.

The pigment known as arsenite of copper is a good deal used in colouring confectionery, chocolates, gelatines, &c. In one instance, the subject of a criminal trial, it was employed to give a fine green colour to the blanc-mange served at a public dinner, and caused the death of a gentleman who partook of it. The cook, supposing the green colour was merely an extract of spinach, produced a dish more pleasing to the eye than the stomach. Arsenical pigments are used as colouring for pomades, producing serious scalp eruptions. It may be stated, however, that the symptoms of wall-paper poisoning present scarcely more than one or two in common with those of arsenic administered as a remedy. We might almost say the symptoms in common are those of certain forms of skin disease; but here, again, this can scarcely be relied upon, and we are in danger of falling into an error of diagnosis for another reason—that comparatively harmless drugs will produce irritative cutaneous affections. For instance, work-people employed in the manufacture of quinine suffer from irritation and inflammation of the eyes, catarrh, and eczema of the hands and arms. Patches of pustules also appear from the same cause, ulcerate, and produce much discomfort. The irritative skin affection set up by this and other substances is generally attributed to the mechanical action of the needle-like crystals of the substance, this will not explain the cause of of bakers' eczema, nor the dust of the linseed meal, which produces in the grinder the symptoms of chronic asthma.

Pigments Employed in Paper-Staining.—Of the several arsenical preparations employed in wall-paper printing, the most dangerous, because the most extensively used, is the trioxide. This is a principal ingredient in

Digitized by Google

Scheele's green, a fine green powder composed of one part of arsenic trioxide, and two of cupric oxide. Schwienfurt, Brunswick, Vienna, or emerald green, is an aceto-arsenite of copper, a preparation rather extensively employed by paper stainers, both unmixed and mixed with zinc oxide in various proportions, and which imparts the more delicate tints of green. Another pigment is composed of chromic and ferric arsenate, whilst arsenious acid is used on a large scale in the preparation of aniline flyes, and of red anilines in particular. Sodium arsenite is almost exclusively used in calico-printing, and alumina arsenate for fixing colours. In every case the arsenical pigment is mixed with size or organic matter of some kind, and in this way it is made to adhere to the surface of paper and fibres of which muslins are composed; the consequence is, that after it becomes thoroughly dry, the colour cracks and peels off if only gentle friction is applied. Then, again, arsenic in many of its more potent forms is extremely volatile. At a moderate heat it passes from the solid to the gaseous state, and may be detected by its yellowish colour and alliaceous odour; and although the colour and smell might not attract the attention of the ordinary observer, it is, nevertheless, a fact that an appreciable quantity of gaseous and solid particles of arsenic will be separated and diffused by the action of the air of an ordinary sitting room, especially in the summer time when the air is damp or moist. It may be thought that the quantity given off is too small to produce symptoms of poisoning. But this is a hasty conclusion to arrive at for on analysis Dr. A. Taylor found that from each square foot of arsenical paper, he was able to produce from fourteen to seventeen grains of arsenic; and from certain papers printed with a peculiar pigment he obtained as much as fifty-nine per cent. of arsenious acid.

Beside this "devil's dust," there is the arseniuretted hydrogen evolved by the decomposition of the organic matter mixed in with the arsenic, and which is absorbed more rapidly than the dust, by the lungs and the whole cutaneous surface. Arseniuretted hydrogen contains one grain of arsenic in each cubic inch of gas, and is known to be a most deadly poison. On the whole, then, arsenical preparations are of a very volatile nature, and this renders them more virulent; Dr. Tidy tells us, that "volatility and virulency usually go together," and we seem to have the fact exemplified in arsenical poisoning from wall-papers and other articles. With regard to colour it is very generally believed that only green papers are dangerous. This is a fallacy, a number of other colours are quite as poisonous. Blue, mauve, red, brown, and even white papers have been found, on examination, to be arsenical. Only a short time ago French colour makers introduced into England a variety of attractive arsenical colours for the especial use of manufacturers. These colours were all more or less poisonous, and, as usual, the more attractive yellows, reds, violets, mauves, browns, greys, besides every shade of green, the fixing agent being oxide of chromium, a most dangerous addition to any pigment. The public should be put on its guard against French imported articles of domestic use, dyed with these colours. It is considered by some persons to be somewhat doubtful whether white papers contain arsenic, and I have endeavoured to clear up this point. On careful inquiry, I have ascertained that arsenic finds its way into almost all papers, often quite independently of the surface colour, in this way. The size used for fixing the pigment on the paper is very prone to decomposition, to prevent this, makers introduce arsenic. This size is also largely employed by paper-hangers — first, for preparing the walls, and secondly, for hanging the paper. Arsenic is likewise much used by white-washers, in all distemper colouring of walls and ceilings of rooms. With regard to the colour of wall-papers, I have the authority of Prof. Heisch for saying that samples of French greys and whites have been carefully tested by him and are very arsenical. Furthermore, that a paper-hanger, largely employed, assures him that the men who work with him suffer more whilst hanging grey papers than almost any others. Prof. Dr. Hodges, of Belfast, informs me that he has discovered arsenic in very many other papers beside greens. He adds: "I have seen a number of cases of poisoning from variously coloured arsenical papers. One lately impressed me very much. It was that of the daughter of a clergyman who for years had been a great sufferer from headache, throat irritation, &c., which resisted all treatment. Her bedroom, as well as other rooms in the house, were covered with papers (not green) containing a large amount of arsenic; on their removal her health rapidly improved, and she was soon quite restored." Another lady, Mrs. Stelfox, writes Dr. Hodges: "I can scarcely describe the peculiar nature of the symptoms experienced by myself. But with regard to my child, she was rendered utterly sleepless; waking every few minutes through the whole of the night, and always with a sharp piercing cry. The nurse's impression was, that the child was choking, as she always, on waking up, asked for drink. The whole of the unpleasant symptoms ceased when, on your recommendation, she was removed to another room. This was, of course, after the nursery paper was tested by you and found arsenical. I therefore hope something will be done to put a stop to this dreadful system of poisoning." Miss Osborne, of the Sydney Hospital, in a letter, dated March, 1879, writes: "I was speaking to the foreman of the largest firm of painters and decorators here on the subject of arsenical wall-paper poisoning, and he quite confirms all you say of the deleterious nature of the substances used in wall-papers and paints." He also adds, "Confectioners come to our shop for large quantities of colours, some of them harmless enough, others poisonous enough, for colouring lollies (sweets), and the quantity of these sweets consumed by young and old in the colony is something marvellous." (a)

The animal creation has not escaped the evils of arsenical wall-paper poisoning, for Mr. Fred. Greeves, of Emneth, Cambridgeshire, complains of having recently lost three beasts from this cause. It appears that, in course of cleaning, some green paper was torn from the walls of the house in which he lives, and thrown in the yard where the stock got at it. Three beasts seem to have eaten a portion of the paper and were seized with illness. A veterinary surgeon was called in, two of the animals died, and on being opened, it was discovered that the arsenic in the paper was the cause of death. A third has since died from the same cause.

Late investigations have, I venture to think, brought to light a few important facts in connection with the subject of arsenical domestic poisoning, the symptoms of which certainly differ from those observed in the administration of arsenic as a remedy.

First, then, there is the danger arising from the microscopic arsenious acid crystals, which being separated from the paper by the action of currents of heated air, float about are inhaled and absorbed by the mucous membranes and the skin; secondly, there is danger from gaseous products, arseniuretted hydrogen, liberated by decomposition of the organic matter mixed with the pigments, and which are likewise inhaled and absorbed by the vascular surfaces of the lungs, air-passages, and cutaneous surface. The danger to the public health will not be met by simply contenting ourselves by warning the public, Parliamentary action must be evoked in the matter, and manufacturers and sellers of a poisonous material must be placed under the Adulteration Act and made answerable for the injury done to health and life.

(a) For other cases of poisoning, with a detail of the symptoms, see my paper read at the Medical Society of London, and printed *in extenso* in the *Sanitary Record* of April 25th. After the reading of which a committee was formed to collect further evidence on this important subject. See also *British Medical Journal* of June 14th.

ON THE UNITY OF POISON OF SCARLATINA, TYPHOID, PUERPERAL FEVER, DIPHTHERIA, ERYSIPELAS, &c., &c.

"If a man be content to begin with doubts, he shall end with certainties."—BACON.

By DR. G. DE GORREQUER GRIFFITH,
Senior Physician to the Hospital for Women and Children; Consulting Physician-Accoucheur to St. Saviour's Maternity.

FROM the facts connected with these affections—clinical and pathological—embracing as they do, the etiology, the history of origin, progress, interchange, and intercommunicability and mode of propagation—we cannot avoid arriving at the conclusion that these ailments may be generated *de novo from one common source;* or may be spread from one individual to another, being, in a person hitherto uninfected, generated by communion with one already suffering, or with some secretions, excretions, or something, or person, that has been in contact or communication with the sick.

That there are two forms of scarlatina is distinctly manifest—a fact thoroughly established on evidences from which there is no escape. There is, first, that contracted from a scarlatina patient, or from some one or thing, that has been in contact with, or in communication with him; and second, that generated *de novo*, from noxious drains, sewers, imbibition or ingestion of pernicious articles of drink or food, such as tainted water, milk, cream, decomposing animal or vegetable substances, or from deleterious matters, absorbed, or otherwise passed into the blood, and thence into the tissues of the body, more or less generally. As an example of what I mean, I shall give the following particulars:—

At one of the recent meetings of the Harveian Society, the President brought forward a case which he termed "Simulative Scarlatina from eating Tomatoes," in which occurred all the symptoms of scarlatina, except that there was no desquamation; and for albumen in the urine no search was made.

In passing, however, I may observe again—I have made the same remark elsewhere—that desquamation is no proof whatever of the existence of scarlatina; and its absence, no disproof of scarlatina having attacked a patient; for, high temperature of the skin, arising from any causes—and they are various—setting scarlatina aside altogether—will occasion such rapid cell changes, that the surface cells will be thrown off in larger or smaller quantities and masses, according to the height to which the temperature has run, will be in fact shed wholesale, being effete; thus arises that process which we call desquamation: while in some undoubted cases, of what we must term scarlet fever poisoning, so as to make ourselves understood, there may be only slight exaltation of temperature, or so transiently may it take place as to escape detection, and not produce the cell changes and exfoliation of the cutis, which constitute desquamation; or, it may even be altogether absent some think, owing to the great depression of vitality produced by the immense dose in the system, or the suddenness of its invasion. With this absence of high temperature, desquamation will also be absent. Nor is albumen in the urine a pathognomonic of scarlet fever poison pervading the system.

In how many conditions and affections of the body other than those demonstrating the existence of scarlatina will not albumen be found? "There is nothing unusual in the fact that inflammation of an important surface should be attended with albuminuria," says Mr. Jonathan Hutchinson (see *British Medical Journal*, May 3, 1879, page 665, under head of "Discussion at Medical and Chirurgical Society, on report of the Committee on Croup and Diphtheria").

Here, in the person of the patient brought before us, was undoubtedly a case of scarlet fever symptoms, generated as far as could be traced by the eating of tomatoes; no source of contagion or infection having been discoverable, these fruits setting-up certain changes in the system which were sufficient to produce a general poisonous effect, that demonstrated itself in phenomena or symptoms—the majority of which, or the entire—in the aggregate, leading us to say that person has got scarlatina.

Bearing upon this case, I adduced an instance wherein the symptoms of scarlatina were all so marked, that I thought it specially applicable, and fully corroborated the President, in showing that ingested materials will, at times, induce symptoms so closely resembling scarlatina, as to be undistinguishable. How then does the attack differ from scarlatina which has been contracted from a scarlatina patient, or some one or thing that has been in communication with him in one way or another? And, wherein does scarlatina consist?

In my case the symptoms arose from eating very high game; and though not proceeding from eating tomatoes, it is relevant; first, because in all points it was one of simulative scarlatina—a name I was the first to use some years back; or, as it might be really termed, of true scarlatina; second, because it arose from a similar, though not the same, cause, ingested material; and thus, third, was an answer to the query propounded—Were the symptoms in the instance read to us due to eating one of the Solanaceæ order? inasmuch as it shows that causes, other than the active principle of that order, produce such symptoms, even while holding and admitting that the active principle of the tomatoes may in this particular patient have directly originated the symptoms, and been the source of the illness.

A second case which I adduced bore strongly on the same; so strongly indeed, that, as it had been published in 1875, I thought it better to read it than to quote it from memory, that I might not lay myself open to the suspicion of coining it to tally for the occasion. It also was to the point:—First, because in symptoms it was identical; second, was what would be termed "simulative scarlatina;" and third, showed that these symptoms may arise even from *animal* poisons passing into the system *in a way other than by the mouth*—viz., by the womb—in contra-distinction, though not in opposition, to the case submitted to our notice. Thus again answering the question directly, by showing that the simulative scarlatina symptoms are not necessarily dependent upon the ingestion of solanin, since they would be produced by animal irritants, or poisons absorbed into the system, not through and from the mouth alone, but in other ways also. I will here relate the case, and conclude with some remarks bearing upon it and upon the entire subject:—

The conditions alluded to, and which are identical with scarlatina, or are the same (I now consider), having their origin not from scarlet fever contagium, that is from a scarlatina infected person, or some one or thing belonging to such a patient—there never having been any exposure to scarlatina in that way—but from the putrescing and offensive matter in utero and vagina, the resulting phenomena being indicative of the concealed cause, the latent mischief that, without careful observation, might pass unnoticed. With the train of symptoms to which I refer, who practising obstetrics is not acquainted? The chilliness or shivering, the sickness, the dreadful headache, and the congested eye-balls, from which the paining light must be veiled, or even shut off altogether; the sore throat, crimson with inflammation; the hot, pungent skin, that so rapidly sends up the mercury, and is dyed with the unmistakeable rash, with which is a tinge of jaundice—yellow, here and there more noticeable; the delirium, the oppressed heart and breathing, and later on the diarrhœa. What are these symptoms to be termed? Not "*simulative* scarlatina" surely, since they are not simulative at all, but are exactly the same as obtain in scarlatina contracted from a previously infected person or source? What then are they? Symptoms of what for contra-distinction' sake, I would term *toxæmic* scarlet fever; but assuredly, as true scarlatina as the other form, though not generated in the way, but

Digitized by Google

germinated *do novo* in the woman herself, and the outcome of the condition of blood-poisoning, existing, *not* from the introit of a *specific virus*, but of noxious elements taken into the system from putrefying animal matter in utero. In a scarlet fever epidemic such a group of symptoms happening to the lying-in would be set down to scarlet fever poison, contracted from another affected with it, or from some one or thing belonging to, or that has been in contact with, such an infected ;—for it is not yet generally accepted that scarlatina can commence *de novo* in the manner I describe—but they will be found where no previous case nor any contagium, other than what I name, has existed. What then are those phenomena ? I gave them the name of bastard or simulative scarlet fever when I first wrote on this subject, not at that time considering them true scarlet fever, or that the ailment could be so produced *de novo* in the ways that further researches have shown me it can. True scarlatina I considered to be that form contracted from a previously existing case, or from some one or thing connected with, or which has been in some way or another brought under and near the influence of the scarlet fever virus existing in such previously infected patient. Bastard or simulative scarlatina I considered to be those scarlet fever manifestations or appearances resembling (as I then thought, but which I now know to be not resemblances but the actual manifestations themselves of) scarlatina, and resulting from such a source of contamination as may occur in the lying-in, or from vitiated water, milk, cream, or the taking in of "high," *i.e.*, putrescing articles of diet, or decomposing drinks, such even as milk, which has begun to undergo deterioration, it may be, simply because it has been long "drawn," or it may be because it has been allowed "to stand" in a place, or under circumstances of temperature, which would permit or hasten such changes as I refer to, the milk being at the time not unpleasant to the ordinary taste, nor perhaps perceptibly altered in flavour. But now I recognise these symptoms arising from those latter causes, to be as true scarlatina, and to be as infectious and contagious, as the other form—terming them "Toxæmic Scarlatina ;" and the other, "Orthodox Scarlatina," since its mode of origin is recognised by the profession generally.

The following remarks will explain what I mean when I say that even milk undergoing deterioration will produce scarlet fever :—

On Thursday, January 30th, 1879, at the meeting of the Metropolitan Counties Branch of the British Medical Association, Mr. Gay, in a paper on "Milk as Food for Man," said :—"In the absence of any positive knowledge as to the source of the various exanthems—measles, scarlatina, and the like, characterised by fever, and without doubt related to some form or forms of blood poisoning, disorders that abounded mostly after dentition, and when milk was often the predominating, if not the sole article of food, was it unreasonable that we should turn with suspicion to those unwholesome ingredients of decaying milk for their explanation ?" He continues—"Milk when once exposed to the air and at rest, underwent a series of chemical changes through the influence of external and internal agencies which ensued in its degradation and decay, its last stage being that of a limpid fluid, mainly composed of water, salts, and acids, amongst which figured the lactic, butyric, caprionic, and capriolic. To this downward career it was carried by becoming the habitat of broods of vibriones of different kinds, and, according to Professor Lister, of a certain bacterium—bacterium lactis —and by certain carpetings of its surface by oïdium, and other varieties of mould."

These deleterious, if not absolutely poisonous, changes in a fluid introduced into the system and taken up into the blood, will show how milk, and cream, and substances or fluids with which they are mixed and combined, will prove a source of originating blood poison which, in different persons, or in the same persons at different periods of life, and under different circumstances, will declare itself in symptoms at one time, or in one person, of one or other of these so-called different affections ; at another time in the same person in a different form of symptoms ; or at the same time in different people in the different manifestations to which have been given specific names, —scarlet fever, typhoid, puerperal fever, diphtheria, erysipelas, &c.—for the purpose of distinction and of conveying to others what we mean.

I would call to mind how often the puerperal woman is dosed with gruel made with milk, is drugged with milk—that has in many cases been standing for some hours, and many times in the puerperal room itself (wherein the atmosphere by ignorant people is not always kept the sweetest)—on the supposition that milk creates milk ; how the children, and husband, and household partake of the same milk ; and how vitiated (as shown in Mr. Gay's paper) even good milk becomes by standing, how much more by standing in the atmosphere of the lying-in chamber ; and how readily this fluid becomes a unity and entity of originating virus in a household, or circle of people poisoned with it, amongst whom there would be *from this one source* a differentiation and divergence of results, of phenomena of the poisonous action, of symptoms directly consequent, so that one or more would be said to be suffering from scarlatina, others from typhoid and diphtheria, or one of the other generally supposed specific and distinct ailments of which I write, the lying-in mother being attacked with what would be termed puerperal fever.

Sir William Gull has stated his belief that diphtheria may "commence locally, forming a poison which will propagate itself ;" and he has "drawn a distinction between diphtheria and diphtheritic poison, regarding the disease, as beginning with a poison, but sometimes as commencing locally, and forming a poison which propagates itself" (*Brit. Med. Journal*, May 3rd, 1879, p. 666). And it will be found that scarlatina generated *de novo* from blood poisoning, effected in any way than that *usually accepted as being the only way* scarlatina is generated and propagated—viz., from a previously scarlatina-infected person or thing—is infectious and contagious alike with the other form. I do not now consider that to be bastard or simulative scarlatina which I formerly described as such, but look upon it as true, generated differently, propagated similarly, and worthy the name, Toxæmic Scarlatina.

I was first led to these conclusions by a case of autogenetic poisoning which was under my care in 1875, in which the scarlet fever symptoms obtained ; but which recognising to be wholly the consequence of a morbid condition of the uterine system and its excretions—in fact, begotten and conceived in utero from matters therein—I treated accordingly, by grasping the soft spongy uncontracted uterus with my hands, compressing it, expelling thereby the retained and offensive clots, washing out the vagina and uterus by means of Higginson's syringe, Condy, and warm water being used every two hours, till the lochia became quite inodorous. Had I, however, seen the patient for the first time when those scarlatina symptoms were fully developed, I might have erred in supposing I had to deal with scarlatina from a previously infected person or thing, have overlooked the *de novo* cause—the latent uterine mischief—have neglected the ablutions and cleansing processes, have treated the ailment in the orthodox fashion as being contracted from previous scarlatina infection, and no doubt have lost my patient. But being alive to the puerperal facts and bearings to which I have drawn attention, I at once proceeded as I have described, and the correctness of the diagnosis was evinced by the immediate improvement in the lady, commencing as it did from the very time I got rid of the offensive clots and washed away the noisome lochia.

Within twelve months I have had three cases of puerperal blood poisoning in which, not alone was scarlatina rash well marked, but also the other symptoms of scarlet fever. I had learned from my first case valuable knowledge, by which I have profited ; and these later patients I accordingly treated as suffering from "toxæmic scarla-

Digitized by Google

tina"—if I may be allowed the term, to distinguish it from the other, or "orthodox," form—the toxæmic resulting from the presence in the generative system of putrescent matter, which, being washed away and the parts cleansed, the symptoms were removed.

Some time ago I had, in consultation with Dr. Joliffe, of Shepherds Bush, a case of typhoid fever, in which relapse occurred while convalescence was advancing, and desquamation—as truly marked as in what would be termed a typical case of scarlatina—was actually taking place.

In the same house where lay this sick mother, the younger members of the family had *previously* been affected with scarlatina, others having suffered from what is termed "sore throat," while others again were, at the time of the mother being ill, complaining of the same; the cause of the outbreaks being, as far as could be discovered, the defective drains which allowed regurgitation into the house of noisome smells and vapours.

It will be seen what a modification of my views has taken place since 1875, when I first entered upon the study of this question—the unity of poison and differentiation of resultant phenomena which we call symptoms—how study and research have made clear to me, what before I had not recognised; how out of much mistiness, obscurity, darkness, and chaos of facts, ideas and thoughts, clearness, light, order, have been evolved in my mind; so that what was to me at first vague, indefinite, unshaped, is becoming certain, defined, and embodied in realities; that what I thought to be incapable of proof came to be more and more provable, till it has at length become proved; and what, at one time from teachings and consequent prejudice seemed to me to be false, gradually opened out to me as true, till they have come to be established in my mind as a great truth. Like the man of old, who when sight was first given to him, saw men like trees walking—that is, indistinctly beheld what was all around him quite clear and discernible—so also I at first saw. One thing I now do know, that whereas I was blind now I see, not in a glass darkly, but face to face with naked facts and truths; now I no longer see in part, but know and discern. The sky was at one time all dark; star after star hung out its pale lamp of the light of knowledge and of truth; brighter and brighter they grew, so that the thick darkness was cleared away; one star shone out brighter than all, like as does the full-orbed morning star; it was the star of hope, that, in the cycle of time, the day of knowledge would wake and never close its lids again, that the morning of fuller knowledge would break, and the sun of completed knowledge would rise higher and higher till it shone at its zenith, unclouded, so that every eye may behold and every mind understand.

In a subsequent paper I will explain Toxæmic Typhoid, Toxæmic Diphtheria, Toxamic Erysipelas, and how the toxæmia, being introduced into the system, works within, generates the poison which demonstrates its inward presence by outward manifestations—which we call symptoms.

Clinical Records.

MERCERS' HOSPITAL, DUBLIN.

Under the care of Mr. E. STAMER O'GRADY.

AMONGST the patients in this service whose cases came to a conclusion during the first three weeks of the past month (June) were the following:—

Severe Mutilation of Forearms and Hands, with Avulsion of Digits (Two Cases).

A. The right thumb and all the fingers of the left hand torn away. With the thumb came the long flexor tendon carrying a considerable quantity of muscular fibre attached. The bone "parted" just below the metacarpo-phalangeal articulation, the integument being torn irregularly, so as to afford a moderately good covering on excision of the proximal extremity of the shattered phalanx. The ungual phalanx of the third finger of the same hand was also smashed, and in part lost. The left hand was severely mangled, the thumb escaped, but all the fingers had been torn off, and completely detached, bringing with them both flexor tendons, one set yielding shortly above their insertion, the other at their muscular attachment, and carrying some of the fibres with them. Here, too, each of the bones had "parted" just below the metacarpal phalangeal articulation. The dorsal integuments of the hand were torn across in a line above the knuckles, receding very obliquely towards the wrist on the ulnar side; the laceration on the palm ran in much the same direction. The patient, a healthy, temperate man, thirty-four years of age, was admitted immediately after the occurrence of the above injuries, which were caused by his hands becoming entangled in chain machinery connected with a steam engine.

After dissecting up the soft parts on the dorsum, the four metacarpal bones were sawn through in an oblique direction parallel to and higher up than the torn skin, the section of the metacarpal bone of the index being just above its articulation with the proximal phalanx and that of the fifth metacarpal bone immediately below its carpal joint. The lower ends of the metacarpal, together with the shattered remnants of the proximal phalanges having been dissected out, and a few vessels tied, the flaps were brought into apposition, and so supported by straps of adhesive plaster and pads. All the wounds were dressed with lint saturated in blood, with pads of the same material soaked in Friar's balsam superimposed. Half-a-grain of morphia was given subcutaneously, and ice-bags kept applied to both forearms, poultices being substituted after a few days. Much constitutional disturbance followed and lasted for a considerable time. Suppuration occurred extensively up both forearms. There was severe hectic, with marked night sweating. Eventually, constitutional and local repair got started, and the patient was able to leave the hospital forty-nine days after the injury with the parts soundly healed. The stump of the left hand was much more shapely than it at first promised to be, and there seemed fair prospects of its becoming a moderately useful member.

B. A young woman got her right hand entangled in machinery for teasing hair which caused an extensive lacerated wound, wholly destroying the integument on the radial side of the lower third of the forearm and of the hand, the palmar and dorsal aspects of which were also extensively stripped. The thumb was disarticulated, and its long flexor torn completely out, bringing with it some of the muscular fibres. All the fleshy and tendinous structures in front of the wrist and forearm were raised up, and more or less torn out, the surgeon's fingers passing entirely through from side to side of the forearm, between the bones and the anterior soft parts. (*a*) The wrist-joint itself was laid wide open, and the hand dislocated backwards. Operative interference was absolutely declined. The free bleeding was treated by pads of lint moistened with muriate tincture of iron firmly bandaged on. At first the condition of the patient required opiates to be freely used; subsequently a tonic and stimulant line of treatment had to be adopted. The constitution suffered profoundly for a long time. The fingers retained vitality, but the thumb and large portions of the damaged integument of the hand and forearm sloughed. Reparative action was tardy to begin, and slow in its progress. Much care was bestowed on the dressing, to maintain as satisfactory a position as possible. Sixty-eight days

(*a*) Though in this case the tendons were not torn clean out, yet, from the laxity and separation of the parts, it was evident that higher up the rupture of tendon from muscular fibre must have been considerable, in character if not in degree approaching the previous case.

Digitized by Google

after the accident the patient left the hospital to attend as an extern ; the parts were then healed, except a healthy ulcer of 3¼ in. by 1½ in. surface, seated about the root of the old thumb, from the nipple-like remains of which some fragments of necrosed bone (which the patient would not allow to be removed) protruded. The preserved hand and fingers were rigid and immovable. During the woman's subsequent attendance as an extern the ulcer continued to steadily cicatrise.

Cleft Palate (Two Cases—Osteotomy in both).

A. A girl, æt. 18, where hare-lip had been operated on in early infancy, came to town in charge of her young brother, who had an aggravated hare-lip. After a very successful operation on it she sought surgical interference for herself. The gap was an extremely wide one. The edges having been pared the horizontal plates of the superior maxillary and palate bones were divided with Sir Wm. Fergusson's chisel. Section of the palato-pharyngi and palato-glossi muscles was also practised. Good union resulted, except in the immediate front, where an orifice as large as a thumb-nail remained. This is reported to be steadily diminishing in size since the girl's return home.

B. Male, æt 20, who had been operated on by Mr. O'Grady for double hare-lip a couple of years previously. In this case, too, the palatal gap was an exceptionally wide one. The operative procedure was as indicated in the previous case. Primary union occurred throughout the whole extent of the long wound, except a small portion at the centre ; granulations steadily reduced this, the opening being, when the patient left hospital a month after the operation, such as would not admit the passage of a pea. Subsequent reports represent this perforation as continuing to diminish in size.

Removal of Breast, Fatal Secondary Hemorrhage.—Patient was aged 54, and had of late suffered much domestic trouble. She first noticed the growth on upper part of outer side of her right breast a year before her admission to hospital. Lately the tumour was growing rapidly, and attained the dimensions of a large apple, the breast itself being a dry, flabby one. The skin was slightly attached, but there were no adhesions to deep parts. There was one perceptibly enlarged, but not hard, gland. The patient's appearance was unhealthy ; her general health was obviously below par. It was her earnest wish to have the operation, which was not recommended, performed. The ordinary superior and inferior elliptical incisions enabled the adherent portion of skin to be removed with the breast, after which the gland alluded to was taken away. The surface of the wound was dabbed with a solution of chloride of zinc, and supported by adhesive straps, pads, and bandages, due provision being made for "drainage." At first the patient seemed to do well, and the progress of the wound during the earlier days was apparently satisfactory. Soon, however, a dull and depressed condition supervened, and local reparative action ceased. The position was apparently mending, when on the eleventh day a smart flow of mixed arterial and venous blood began from the axillary margin of the wound ; but little blood was lost, however, the hæmorrhage being promptly arrested by plugs of lint wrung out of turpentine. These came away next day without the return of the bleeding. There was nothing particularly noticeable in the registrations of the pulse or the temperature, but the woman was now low and weak ; she shivered a good deal, and was often covered with cold perspiration. Still, under the influence of appropriate treatment internally, with balsamic dressings locally, she rather plucked up, and three days later, at the time of morning visit in the ward, she was calmly sleeping, and after a good night looked better in the face than she had done for some time. Soon after awaking, she remarked quietly, "I am bleeding." It was only to cross the ward from the opposite bed to verify her statement. There was no delay in cutting away the dressing, exposing the wound and plugging it. This commanded the bleeding, which, during the very brief space it lasted, was profuse, but the patient rapidly became blanched, pulseless, and was dead in less than ten minutes from the commencement of the bleeding. Various restoratives had been diligently plied, and the necessary preparations for transfusion were completed, one of the members of the attending class, Mr. Chas. M. Brady, having volunteered, and prepared his arm, to supply the blood. No examination of the body could be obtained.

Large Ischio-Rectal Abscess occurred in a fire-brigade man, æt. 32. The swelling was very considerable, the perinæum being much bulged out ; both sides were affected, but the left notably so. Two free incisions evacuated about half a pint of excessively fœtid pus, together with large masses of sloughing areolar tissue. More of these, together with an abundant suppuration, continued to be discharged for a few days, when the parts rapidly repaired, patient being able to leave the hospital in a fortnight, the left incision being still open, but giving little or no trouble. Since leaving the hospital, he has been attending for a small suppuration in the left groin. The trouble was not attributed to injury.

Cervico-Axillary Cyst with Disease of Shoulder-joint—Excision of Head of Humerus and of Glenoid Cavity.—A strong unmarried woman came under notice with a large semi-elastic swelling occupying the front of the region of the shoulder. This extended inwards about half the length of the clavicle and protruded into the axilla. The surface in parts was of a dark purplish colour, large veins ramifying over it here and there. The general feel was solid, firm, and resistant, with, in parts, an elastic pseudo-fluctuation doubtfully to be detected. Free manipulation of the joint caused no pain, though during the movements an occasional crack or crepitation was both felt and heard. The hand, forearm, arm, and entire scapular region was greatly swollen and œdematous. The trouble was not sequent on known injury, and was first observed only six weeks previous to the patient coming under notice. Prior, however, to the tangible development of the local mischief, the medical gentleman, in whose locality the woman lived, and under whose observation she frequently was, had been struck by a marked deterioration in her general appearance and condition. Two days after admission a fine trocar was introduced through the most prominent portion of the swelling, the skin having been previously slid over it, so as to secure a valvular opening, gave vent to more than three-quarters of a pint of a glairy fluid which flowed slowly out, and towards the end became deeply sanguineous. After removal of the canula and closure of the puncture with adhesive plaster, a considerable quantity of the above fluid continued to be discharged. The partially relaxed state of the soft parts now allowed the fingers to be sunk deeply beneath the acromion. The upper extremity of the humerus was readily ascertained to be displaced forwards and inwards. Restoration to the normal position was easily effected, but as soon as the retaining hand or pad was removed from the axilla the displacement immediately recurred. During these manipulations, which were free from pain, the crepitations above-referred were very manifest, suggesting to one surgeon of large experience the idea of rigiform bodies in the joint (*a*) ; to another, that of chronic rheumatic arthritis ; to others, caries.

In 48 hours the œdema of the limb was greatly diminished, though the swelling had largely reformed. No pain nor trouble had followed the tapping. The cyst was now punctured again, and about the same quantity of fluid (very sanguineous at the commencement and termination of the flow) evacuated as on the first occasion. A fine probe introduced through the canula found no

(*a*) The microscopical examination of the fluid gave negative results, no appearances of malignancy, nor of synovial character in the fluid removed could be detected.

Digitized by Google

bone. In consequence of the lessened adherence of the soft parts full and satisfactory examinations were now practicable, by which a comparatively solid portion of the growth could be clearly mapped out in the axilla; this did not appear to be very adherent. The grating or crepitation was extensive, the deep surface of the scapula being also affected. No pain followed this puncture either, nor other annoyance, save that on this occasion the flow remained continuous, notwithstanding which considerable re-accumulation and tension of the sac again came on. Tonics were given internally, and the locality of the shoulder painted with a mixture of iodoform in collodion. The parts throughout were adequately supported in normal position by suitable retentive apparatus. The tappings were occasionally repeated; later on drainage-tubes were inserted, and injections of linimentum iodi practised, also fully distending the sac with carbolised water.

After a time the patient's health became gravely deteriorated. A little more than a month after her admission the much diseased and absorbed upper extremity of humerus was exsected through a long incision running downwards from the point of the acromion. The glenoid surface and all other tangibly diseased portions of the scapula were gouged away, after which the cyst interior was freely scraped with Volkmann's "Sharp spoon." Subsequently the entire wound was thoroughly dabbed with a (40 grains to the ounce) solution of chloride of zinc. The parts were adequately supported on an internal splint, due provision being made for the effective drainage of the large wound. For a time the discharge continued to be profuse, and the general condition of the patient threatening. Improvement, when it began, was rapid, the splint being dispensed with eighteen days after the operation, the patient having been able to get up and go out some days previously. An acute abscess from pressure of the splint formed in the right breast. This healed kindly after being opened. Circumstances of a private nature compelled her to return home thirty-six days after the operation, her health was then greatly improved, and the wound nearly healed on the surface, but a sinus opening at its centre continued to discharge freely and admitted a probe deeply. No bone could be felt. (*a*) The motions of the shoulder were being gradually regained, abduction and elevation of the arm could be effected unassisted, to a considerable extent. Since her departure from the hospital the progress of this patient has continued to be very satisfactory.

Translations.

CONTRIBUTION TO THE STUDY OF THE OSSEOUS TUMOURS ON THE EXTERNAL AUDITORY MEATUS.

By Dr. DELSTANCHE, fils, Brussels.

Translated, by permission of the Author, from the "Mémoires Courronnés et Autres Mémoires," de l'Académie Royale de Médicine de Belgique,

By JAS. PATTERSON CASSELLS, M.D., M.R.C.S., Lond.,

Fellow of the Faculty of Physicians and Surgeons; Surgeon to the Glasgow Dispensary for the Diseases of the Ear; Aural Surgeon to the Glagow Royal Infirmary; and Lecturer on Aural Surgery in the Royal Infirmary School of Medicine, Glasgow; Membre-Correspondant de la Société Royale des Sciences Médicales et Naturelles de Bruxelles.

(*Continued from page 45.*)

According to Gruber, the obliteration of the Eustachian tube is observed so frequently in persons attacked with the affection in question, that this fact could be attributed, not to a simple coincidence, but to the development of osseous tissue on the walls of the tube, under the influence of the same cause which has produced the osseous proliferation in the interior of the external meatus. To strengthen his opinion he recalls that other observers have almost always found the cause of the imperviousness of the Eustachian tube, to be in correspondence with the osseous portion of the external auditory canal.

It is not our intention to contest this fact in itself or the explanation given to it by Gruber; we maintain, however, that we have not met with a single case of exostosis of the auditory canal complicated with invincible obstruction of the Eustachian tube.

In spite of the usual harmlessness of osseous tumours of the external auditory meatus, they can, not only cause deafness, but a series of subjective phenomena, which impose upon us a certain amount of reserve, from a prognostic point of view. But it is chiefly when the affection is complicated with otorrhœa that the prognosis becomes serious.

Who can conceive that in cases of suppurating otitis of the middle ear, that the existence of similar tumours on any part of the meatus whatever, can, by contraction or the complete atresia that results from it, favours the retention of pus in the interior of the drum, and becomes therefore the cause of frequently fatal accidents?

Politzer has perfectly explained the influence that contraction of the external canal of the ear exercises, in these circumstances, in the necroscopic results obtained by him in two cases of suppurative inflammation of the ear, with this difference between them, that in the one case the pus could run out according as it was produced, while in the other, a marked contraction in the external auditory canal occasioned the stagnation of it in the middle ear. He infers from these observations that it is important to obtain always an easy issue to the pus, because if the latter be allowed to stagnate in the depths of the organ and to decompose there, it acquires septic properties and under the influence of the considerable pressure to which it is submitted from all parts, it is able to pass in part along the canalicular veins that join the *sinus transversus* in the mastoid bone and reaching to the wall of the veiny canal, can there cause a septic phlebitis with all its serious consequences.

Dr. Roosa, of New York, relates a very interesting case, where the retention of pus, caused by an osseous tumour in the auditory meatus, was followed by meningitis.

In one of Toynbee's patients, whose auditory canal was closed by an exostesis, except a space of three or four lines, the cerebral symptoms only yielded after the extraction, through the open space, of lamellated epidermis that had accumulated behind the osseous tumour. It is then of the greatest importance, where the exostosis is complicated with a purulent otitis of the middle ear, to use every means to clear the external auditory canal, even in cases where there may be no consecutive improvement in the function of hearing.

One has been limited for a long time in the treatment of exostosis of the auditory meatus; on the one hand, to the administration of internal remedies whose nature varies according to the cause of the affection; and on the other hand, to the application of caustic substances to the surface of the tumours. Thus Wilde, starting from the hypothesis of a chronic periostitis prescribes local bleedings and the internal use of mercurials.

That treatment was a most remarkable success in a case, in which the man was robust and enjoying perfect health and who became completely deaf for a year, in consequence of the obliteration of the right external auditory canal, by an osseous tumour which sprang from the posterior wall of the canal, and whose development was not accompanied by any pain. On the left, the ticking of the watch was still perceived in contact with the auricle, and that was due to the circumstance that the two exostoses existing on that side were stopped in their growth by the meeting of their convex summits, thus leaving a little opening on the in-

(*a*) It was feared the affection of the scapula would prove to be progressive.

Digitized by Google

ferior part of the canal. From the application of leeches to the ears and the internal use of small doses of sublimate of mercury, at the end of 17 days, a very marked lessening of the tumours in the left meatus, was obtained, and the hearing on that side recovered a little its normal acuteness. The result of the treatment in regard to the right ear is not mentioned by the author.

But if this observation shows the possibility of reducing similar tumours by medical means only, one must not forget that for the favourable cases there is a much greater number where internal medication does not exercise any appreciable action.

If the skin that covers the tumour be very thick, one can, says Toynbee, procure some relief to the patient by the application of remedies that will reduce the size of it. In a case of this kind the size of the canal has been increased and the hearing improved by painting the osseous excrescences with a solution of nitrate of silver. According to the same author, the best remedy for reducing the tumour is iodine, which has been used with as much advantage internally, as in applying it behind the ear and on the morbid growths in the meatus.

Such are the only remedies recommended by Toynbee. We have already said that he condemns all operations in regard to the removal of these tumours, except by escharotics.

But all these purely medical means, which stand foremost in the opinion of those who praise them, are only palliatives, and experience teaches us not to rely upon them. Therefore we ought to have considered the deafness arising from a complete osseous occlusion of the canal, as incurable, if modern Otology had not already shown by brilliant successes, what can be hoped for by surgical means in this affection.

It is to Bonnafont that we owe the first experiments of that kind; experiments still very incomplete, but which suffice to show the possibility, in cases, even, of complete occlusion of the external auditory meatus by an exostosis, of re-establishing the perviousness of that canal in a sufficient measure for restoring the faculty of hearing.

In a *memoire* to which we have already alluded, Bonnafont related since 1863, three cases cured by opening a passage between the osseous tumour and the wall of the meatus, with the help of graduated styles and slight cauterisations of nitrate of silver.

The observations of these cases will be read with interest, but their length obliges us only to give here what is strictly necessary for the end in view, viz., to justify the facts recorded by us in this work, and to instruct the reader in the different ways of proceeding in the surgical treatment of exostoses of the external auditory meatus.

Case 1.—M. de F., deafness in the right ear during two or three years, which arose without pain and without discharge. The watch is only heard on applying it to the ear, but the osseous transmission of sound is normal. The auditory meatus is occupied at the union of its two external thirds with the internal third, by an osseous tumour having a convex surface which appears smooth and of a whitish colour, insensitive to the touch of the probe, and whose surface of implantation, corresponding to the upper and internal part of the meatus, is so large as to fill up the whole of that region. No syphilitic or venereal antecedents, partly a slight gonorrhœa, five or six years ago.

As a measure of precaution an anti-syphilitic treatment is instituted, but without affecting the size of the tumour. After several fruitless attempts, the point of a silver probe can be inserted between the tumour and the wall of the meatus at its inferior part. In the treatment of the case recourse is then had to the use of graduated bougies, and slight cauterisations with nitrate of silver on the walls of the opening. On the third or fourth day Bonnafont succeeded in sending through to the other side of the obstacle, a punch of two millimètres in thickness. The hearing distance for the watch reached 30 c.m. During several months the punch was introduced to maintain the opening. More than ten years have elapsed since the operation, the opening is still there and the patient continues to hear well.

Case 2.—A young girl, æt. 17; complete deafness in the right ear for two years; perception of transmitted tones good; exostosis situated at a depth of two centimètres; polished and shining. Springing up from the antero-inferior half of the meatus and touching the opposite half with its summit, leaving no passage for the point of the probe. It was only after six sittings, and at the cost of great suffering, that this instrument surmounted the obstacle. Consecutive use of little graduated whalebone tents, whose thickness reached two millimètres; after two months the hearing distance was 30 centimètres for the watch, and almost normal for the voice. A year later, not only was the opening maintained, but the hearing had improved.

Case 3.—A man, æt. 30; deafness in both ears for eight years; the ticking of the watch is not perceived, either on the ears or on any part of the skull, except on the base of the zygomatic process of the left side, and on the mastoid on the right side. Complete occlusion of both meatuses at the depth of 1½ centimètres, by osseous tumours, whose bases correspond to the inferior part of the meatus.

After some trials, frequently interrupted on account of the pain experienced by the patient, a very slender drill was made to penetrate the superior and posterior part of the tumour on the right side and the anterior part of the one on the left side. After the extraction of the drill, patient heard a little better during an hour or two; but the opening was too small to effect a lasting improvement. A large punch, whose introduction occasions acute suffering, is, at first, only tolerated half an hour, then, after some days, for two or three hours. The hearing distance for the watch was about three centimètres on each side, when the patient was obliged to leave Paris. Before dismissing him, Bonnafont recommended the patient to persevere with the punches which he could introduce himself. In that case, says the author, whatever may have been the length of treatment and the dilatation of the opening, the result would never have been so satisfactory as in the two preceding patients, because the auscultation had proved that the auditory nerves had lost a great part of their sensitiveness.

Encouraged by these successes Bonnafont has proceeded in the following way in a fourth case.

A man, æt. 40, of a strong constitution and without any syphilitic antecedents, consulted him November 10th, 1867, for a deafness in the left year, that had commenced four or five years previously. The hearing was becoming gradually weaker, then the deafness, after having been stationary during a year, became suddenly complete.

Two-thirds of the auditory meatus being healthy, the remaining third was filled by a smooth, polished, and convex exostosis, which obstructed it completely, and whose base was situated below and in front. Osseous transmission of tones was as good on the one side as on the other.

As in the preceding observations, trials were first made to insert the end of a very fine silver probe, between the exostosis and the posterio-superior wall of the meatus, but *that* not succeeding, Bonnafont proposed the trepanation of the tumour, which was agreed to by the patient.

After having estimated that the exostosis might be about 6 or 7 mm., in thickness, and that a very small space separated it from the membrana tympani, Bonnafont applied a little pencil of nitrate of silver to the centre of the osseous excrescence, in order to destroy the soft parts with which it was covered. That first result obtained, after five or six days he commenced perforation, using for that effect the pointed end of a "rat's-tail" file.

The first sittings were long, and painful, on account of the resistance of the osseous tissue, and the frequent slipping of the tool between the skin and the surface of the bones. It was only at the fourth sitting, that the file was so fixed as to enable the trepanation to be begun, which ended, without impediment, and almost without pain, in

Digitized by Google

the space of ten days. To maintain the opening, a little whalebone tent was allowed to remain there, and its use was continued till the hearing improved gradually, as much for the voice as for the watch. The patient, obliged to leave Paris, learned to use the tent himself, with the best results.

When Bonnafont saw the patient again—the 28th May, 1868—the perforation was enlarged under the influence of the graduated tents, and the hearing was perfect.

Although the proceedings which Bonnafont had recourse to in the cases just mentioned constitute a marked improvement upon the purely medical treatment of the exostoses of the external auditory meatus, they are still far from obtaining a radical cure.

We are convinced that Bonnafont would have obtained much better results if, in place of proceeding with the extreme prudence prompted by the fear of exciting a violent inflammatory reaction in the tumour or the meatus, he had, on the contrary, called this reaction to his aid; it is at that price, in fact, that the means which he praises can be followed by a complete cure. Thus, v. Trœltsch reports a case in which the prolonged presence of a little fragment of laminaria, immovably fixed between the osseous tumour and the wall of the meatus, whence it was impossible to remove it, caused a superficial necrosis of the osseous surface with which it came in contact, and at the end of two months he succeded in extracting the portions of necrosed bones, as well as the laminaria, and the canal of the ear, which formerly scarcely gave passage to the finest probe, was so enlarged as to restore the hearing to its former acuteness, after some years of complete deafness. And in the same way, if success has attended the efforts of Miot, it is due, in great part, to the inflammation of the tumour, caused by the operation of trepanation.

The first subject operated on by Miot—a woman—who had an exostosis, the base of which was implanted on the posterior wall of the osseous portion of the external auditory meatus. He trepanned it in three places, instead of keeping, like Bonnafont, to only one perforation, by means of a fine and very pointed trocar, and succeeded in removing some osseous *débris*. These multiple perforations caused a violent inflammation, in consequence of which the rest of the tumour completely disappeared.

The second patient became deaf without having felt either pain or tinnitus; he had simply the feeling of the ear being stopped. On the middle part of the osseous portion of the meatus there was an exostosis implanted on the posterior wall of the meatus, closing it completely. After having put the patient under chloroform Miot made several holes by means of a perforator terminated by two short points, well tempered and very resisting, at first on the anterior part of the tumour, then on other places.

The instrument, although sufficiently wet and tempered, penetrated with great difficulty, and slipped even on some parts, without piercing them. The perforations being made, Miot tried, but in vain, to shake the tumour. During the operation there was a very considerable hæmorrhage, but the results were very benign, since the patient did not afterwards feel the least pain. Some days following a healthy suppuration established itself, bringing away some osseous particles. During a certain time Miot made cauterisations and placed catgut tents to remain in the perforations. The canal became free, and the membrana tympani was seen to be a little opaque, but showed no marked abnormality. The hearing became so good that the watch could be heard two metres off.

The greater or less difficulties which trepanation of an exostosis of the external auditory meatus presents are conditioned by the consistence of the osseous tissue of which the tumour is composed. When one has to do with a cellular exostosis it is almost always the case that the tumour, once its shell is broken, offers scarcely any resistance to the instrument, and nothing would be easier than to finish the operation in a few minutes were it not for the sensibility of the patient, and for the risk of injuring important parts lying behind and near to the osseous tumour.

The selection of the instrument, in such conditions, is of little importance provided it be sufficiently tempered, and kept wet during the operation. But when the tumour is constituted of compact osseous tissue, having the hardness of ivory, the difficulties increase enormously, and to such an extent that one may not dream of emulating the success of Bonnafont and of Miot.

In a case of this kind Field reports that he would never have succeeded had he not attacked the tumour with an American pedal-borer, that dentists have used for some time. In spite of the great penetrating power with which that apparatus is endowed, several long sittings were necessary in order to pierce through and through the osseous mass, which obliterated both auditory meatuses of the patient. In a case of hyperostosis of the external auditory canal, the details of which are fully reported in *Virchow's Archiv.* (73rd vol., 1877), Professor Dr. Moss, of Heidelberg, has employed with success a proceeding similar to that of Field.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 30, 1879.

METROPOLITAN HOSPITAL SUNDAY FUND.

THE Council of the Metropolitan Hospital Sunday Fund met yesterday (Tuesday) at the Mansion House under the Presidency of the Lord Mayor of London to receive the Report of the Committee of Distribution, and sanction the payment of the awards recommended to be made to the various hospitals and dispensaries. The sum collected this year, notwithstanding the hardness of times and the depression occasioned by the war, is rather in excess of that of last year. It very nearly reaches that of 1877—namely, £26,000. The number of hospitals about to participate in the fund exceeds by two that of last year. The sum to be immediately distributed to the 127 institutions is £24,455, and a further sum of £260, that is, 1 per cent. of the receipts of the year, is, in accordance with the new

Digitized by Google

rule xii., to be devoted to the purchase of surgical appliances, together, a sum total of £24,716 to our noblest of charities. For the first time in the history of the fund an attempt is about to be made to assist the more unfortunate amongst hospital patients to obtain what is absolutely necessary to enable them to assist in their own support and that of their families, an artificial leg or an arm, and this without being subjected to the trouble and mortification of stumping over this vast city in search of an unreasonable number of Surgical-aid Societies' letters. Nine hospitals, it appears, were invited to confer by deputation with the Distribution Committee. Of this number only two attended, and by rendering a full explanation on certain points, enabled the committee to determine a higher basis of award than that fixed upon prior to the interview. The authorities of three other hospitals expressed themselves satisfied to leave their cases in the hands of the committee; whilst three other hospitals sent no replies, and it is but fair to conclude that no satisfactory reasons could be given for the high rate of management of which the Distribution Committee complained. One institution only offered a full explanation by letter in respect of certain unusual charges, thus enabling the committee to recommend a proportionate award. This statement, it is to be hoped, will so far satisfy quibblers, and prove to the public and those interested in the success of the fund, that the work of the Distribution Committee is performed in a careful and highly conscientious manner. The duties of managing committees of medical charities, like those of general charities, are, we fear, too often performed in a perfunctory way. These bodies are virtually self-elected, that is, so far as the general body of subscribers is concerned. This of itself opens the door to carelessness in matters of detail; leads, in fact, to a *high rate of management*. Too much vigilance cannot be exercised in this important particular, and we look for further improvements in many ways from the valuable tables issued for the first time by the Council of the Hospital Fund, showing as they do at a glance the average number of beds occupied, the number of cases treated, with approximate cost of treatment, the percentage of cost of management as compared with that of maintenance, &c. Thus, committees will have the means of checking expenditure and results, and of so administering this fund as to secure the greatest amount of good for the greatest number.

THE DISCUSSION ON THE USE OF THE FORCEPS IN LINGERING LABOUR.

The prolonged discussion, which has just occupied several meetings of the Obstetrical Society of London, is of the greatest importance, both from a professional and public point of view, and cannot fail to interest every practitioner engaged in midwifery practice. With regard to the importance of the subject, we cannot, perhaps, do better than commence this article by quoting the significant and philosophical remarks which Dr. Edis made at the beginning of his speech. The last published accounts of the Registrar-General for 1876, tell us that in England alone over 4,000 mothers succumbed to the accidents or diseases incidental to childbirth. "This is no great fatality for one year, for during the last thirty years, from 1847 to 1876, an average of 3,500 women per annum have died from this cause." Considering, says Dr. Edis, that we are dealing with a mere physiological function, the carrying out of which is generally under skilled supervision, "I think we must reproach ourselves somewhat that the mortality still keeps up to the extent it does. The triumph of modern surgery is its conservatism, that of medicine its preventive aspect, and unquestionably the direction in which we must labour to bring obstetrics up to a corresponding footing is to endeavour to avert its dangers and difficulties, and not so much to rely upon our treatment of those actual dangers when they have been allowed to come into existence." Lord Bacon has shown us how much depends upon the direction in which we endeavour to advance the sciences, and few will deny that, in the sentence last quoted, Dr. Edis has mapped out one good way towards the advancement of obstetric medicine. Another reason why such a discussion was desirable, is that at the present time practice differs very widely. As Dr. Barnes remarked, side-by-side we see men using the forceps once in every nine or ten cases, or oftener still; and others using it only once in a hundred cases, or even less frequently; and this, under conditions, that offer no explanation of the difference in practice. It differs, moreover, not merely among general practitioners whose variable skill and experience might be expected to modify their respective practices, but also among the most skilful and eminent obstetricians—obstetricians who, judging from their writings, would be supposed to be guided by the same rules with respect to their use of the forceps. Strictly analysed and compared, says Dr. Barnes, it will be found that the rules for interference laid down by Collins, Ramsbotham, and George Johnston, are all but identical. But while Collins, in the Rotunda Hospital, in the years 1826 to 1833, used the forceps or lever once in 607 cases; Johnston in the same hospital, in the years 1868 to 1875, used the forceps once in every ten or eleven labours. "How men recognising the same principles could diverge so widely in practice" is certainly a "curious study." But that the results of this very different practice were the same is not so much to be wondered at, considering that what Ramsbotham and Collins lost by leaving too much to nature, Johnston gained by the timely use of the forceps, and on the other hand, what the former gained by adopting a more expectant treatment, the latter lost by being too precipitate.

In his very able paper on this subject, Dr. Barnes stated the following propositions as presenting the points that chiefly challenge discussion:—1. In lingering labour, when the head is in the pelvic cavity, the forceps is better than its alternatives. 2. In lingering labour, when the head is engaged in the pelvic brim, and when it is known that the pelvis is well formed, the forceps is better than its alternatives. 3. In lingering labour, when the head is resting on the pelvic brim, the liquor amnii discharged, and it is known that there is no disproportion or only a slight disproportion, even although the cervix is not fully dilated, the forceps will generally be better than its alternatives. 4. In proportion as the head is arrested high in the pelvis, in the brim, or above the brim, the necessity, the utility, and safety of the forceps become less frequent. 5. As a corollary from the preceding proposition, increasing cau-

Digitized by Google

tion in determining on the use of the forceps, and greater skill in carrying out the operation, are called for.

Now virtually, and with a few reservations, the Society was agreed upon the propriety of the first, second, fourth, and fifth of these propositions. The great question at issue during the whole of this long discussion, was whether the use of the forceps is justifiable in cases in which the os is not fully dilated. And, what particularly challenged the opinion of the profession on this point was the extraordinary practice of Dr. George Johnston, in which he had been in the habit of using the long forceps when the os was only moderately dilated. Altogether he used it in 169 cases. In fifty-nine the os was dilated only two-fifths of its extent, that is to say, the os was dilated to a diameter of about an inch and a half. Forty-four of these cases were primiparous patients, and in twenty cases he proceeded to use the forceps when the membranes were still intact. We think it well, both for the sake of our countrywomen and for the credit of the profession, that scarcely any one of the many eminent obstetricians who spoke on this occasion was in favour of using the long forceps under the conditions just mentioned. We are certainly indebted to Dr. Johnston for having shown us that we can deliver a patient with the forceps in the first stage of labour, even when the os is only moderately dilated; but to follow out his practice, and to adopt it as freely and generally as he has done, would, as Dr. George Kidd remarked, be attended with danger and risk to the patient. Nor were the results of Dr. Johnston's practice such as should claim for it the confidence of the profession. Of the forty-four cases above mentioned, six died, being at the rate of rather more than thirteen per cent. of the patients operated upon; and excluding two cases of convulsions which were brought into the hospital in a comatose condition, there still remains a mortality of 9·5 per cent. Again, in seventy-one cases in which the os was dilated three-fifths, fifty-three were primiparous and eighteen pluriparous. Of the fifty-three primiparous patients two died, or 3·77 per cent. It is not therefore to be wondered at this bold and hazardous practice did not altogether meet with the approval of the Society. Even Dr. Barnes, who is by no means partial to expectant measures, was careful to so word his third proposition that it merely sanctioned the occasional use of the forceps, "although the cervix uteri is *not fully* dilated." So far the society was prepared to go, and no further. In fact, the general opinion of its members was very much as Dr. Lombe Atthill put it, when describing the practice adopted by him at the Rotunda Hospital. "I am induced," he says, "to avoid the use of the forceps before the os is fully dilated; but, on the other hand, if a case occurs in my practice in which I believe it imperative to deliver the woman before the os is fully dilated, I unhesitatingly have recourse to the use of the forceps, notwithstanding that the os is not fully dilated. . . . We use the forceps freely when the head is low and the os fully dilated. We use the forceps when the os is not fully dilated, but with the greatest possible hesitation, and with a full conviction that such a practice is not absolutely safe." These remarks, as we have just said, very fairly represented the opinions and practice of most of the other members who spoke on the subject. Dr. Barnes sanctions, in certain cases, the use of the forceps before the os is fully dilated, but he says that "this operation is not without danger, even in skilful hands;" and he reflects upon the undue degree of contusion, the suffering, and the shock, that he thinks may have influenced the mortality in Dr. Johnston's cases. Dr. Kidd confessed there was a class of cases in which the forceps might be advantageously used before the os is fully dilated. The membranes have dilated it so far that at length they have given way, and the os remains with no pressure upon it, because the head cannot come down to press upon it. Dr. Thornburn, of Manchester, expressed a similar opinion. Dr. Edis, who, with many others, believes that lingering labour may occur in the first stage so as to entail danger to mother and child, sanctions the practice. Dr. M'Clintock endorsed the observations of Dr. Barnes, to the effect that the necessity of this operation cannot be frequent, and that the operation is not without danger, even in skilful hands. Dr. Braxton Hicks did not give a very direct answer to the question at issue, but, incidentally, he admitted it had been his practice to use the forceps in certain cases before the os was fully dilated. Dr. Daly used the forceps under these circumstances thirty times with only one fatal result, and that was a case of hæmorrhage. Dr. Graily Hewitt said that the full dilatation of the os uteri may not occur, and yet the patient may have arrived at the end of the first stage of labour, and that in these cases the os is in an exceedingly dilatable condition—a condition which does not offer any obstacle to the passage of the head through it. In certain cases of this kind the use of the forceps is necessary, but, "confessedly," he added, "these cases are rare and unusual." Lastly, passing over several names less known to the profession, we may remark that the distinguished President of the Society likewise endorsed the opinion that had fallen from most of the members who had spoken on the subject; but he thought, as many others, perhaps, will think, that a great deal too much had been said about the application of the forceps before the complete dilatation of the os uteri: for he was afraid that outsiders might have the impression that this practice was much more customary amongst obstetricians than it really is. Such an impression, however, is not likely to remain long in the face of the statement made by so experienced an accoucheur as Dr. Roper, and the very judicious remarks which came from Dr. Barnes in the course of his reply on the whole question. In 9,389 cases in the Eastern Division of the Royal Maternity Charity the former physician had used the forceps only 80 times; and although the mortality in these cases was not quite so low as that reported by Dr. Collins, it was much lower than that represented by Dr. Johnston's practice. The latter physician accounted for his high mortality by the fact of the women going into the hospital from districts that were affected by zymotic diseases; but the cases just mentioned came from the courts and alleys of Spitalfields, Shoreditch, Whitechapel, and Bethnal Green, where there were always some of these diseases prevailing. Again, Dr. Johnston stated that he never used the forceps unless there were imminent danger to mother or child, and that he always used them to prevent sloughing; but Dr. Roper had attended 12,000 cases, and had only seen one case of sloughing; and Dr. Collins, who attended 16,000 cases, had only seen one case of sloughing. From these remarks the reader will gather that Dr. Roper was one of the few speakers who

Digitized by Google

entirely disapproved of the application of the forceps before the os was fully dilated. The arguments, however, which he adduced in support of his opinions were not so convincing, or so unanswerable, as were his facts. Nor should the observations of Dr. Barnes be less deterrent to a too meddlesome midwifery practice than those of Dr. Roper. The former physician condemned the practice of those who were in the habit of putting on the forceps once in every eight or ten labours, or "as soon as the head is within reach;" and he remarked that "so long as the uterus is acting fairly, without spasmodic action, the head advancing slowly, and the parts relaxing, and you know that the patient will be delivered in a few hours without any great tax upon her powers, and, so long as there is a quiet, regular pulse, I say it is not judicious to use the forceps."

Before concluding our notice of this interesting subject, we deem it right to allude to a question the importance of which, in these days of preventive medicine, can scarcely be overrated. There is some reason for believing that disease of the uterus and its appendages have very much increased within the last twenty or thirty years. At all events, no one will deny that they are, absolutely speaking, remarkably prevalent at the present day, and that they have become a specialty absorbing the whole time and attention of hundreds of practitioners who have chosen to devote themselves to their study and treatment. But if this class of disease is not only absolutely but relatively more prevalent, it is incumbent upon gynæcologists to discover the cause of a state of things that is the more to be regretted considering the deal of attention the profession is now giving to all departments of preventive medicine. In his very able and suggestive speech, Dr. Roper threw out an insinuation which, if well founded, casts a stigma upon the modern practice of midwifery which cannot be too soon removed. In alluding to the frequent use of the forceps in ordinary practice, he said that "he could not help thinking that much of the gynæcological work of the present day resulted from this frequent interference with the natural functions of the uterus in childbirth. All must have observed the good gettings-up of women who had gone through severely laborious labours, probably a consequence of vigorous uterine action tending to produce good involution." We cannot imagine how "severely laborious labours" can be, from a hygienic point of view, at all desirable; but, nevertheless, the above allegations respecting the frequent use of the forceps in *ordinary* labours, and his suspicions with regard to the mischief probably arising from such a practice, should claim the serious consideration of the profession. The question is of course a very difficult one to solve, but we do not think the solution of it would be unfavourable to modern midwifery practice. On the whole, contrasting the old and cautious use of the forceps, where the policy of procrastination was followed, with the more frequent, and perhaps too frequent, use of the forceps at the present day, we venture to say that *as regards the mortality to mother and child*, the advantages are on the side of that practice which has just been so ably and deliberately sanctioned by the Obstetrical Society of London.

Notes on Current Topics.

The Right of the Dublin Apothecaries Company to Medical Council Representation.

A CORRESPONDENT calls upon us to explain an apparent inconsistency between our comment on Dr. Wyse's letter to the Irish Medical Association, and our reply to our correspondent to the effect that the L.A.H. is a recognised medical qualification. To afford such explanation we must look back to the history of the "Hall." The Irish Apothecaries Company was established under an Act which conferred the right of granting licenses purely pharmaceutical, and for tens of years the Company did not pretend to any other function, and well fulfilled its duty as guardian of Irish pharmacy. In an evil day, the governors—being ashamed of "the shop," and encouraged by the example of the London Apothecaries Company, which had always been legally empowered to license medical practitioners—decided to taboo pharmacy, and convert "the Hall" into a doctor-making corporation. This assumption—as we have said—was and is perfectly illegal, and for years afterwards the L.A.H. was not recognised as anything more than a dispenser's license. In 1858, when the "Medical Act" passed, the License of the Hall was included in its Schedule as a registrable qualification, but—as we maintain—solely as a pharmaceutic degree. Shortly afterwards, the governors applied to the Army Board to accept their license as a medical title for candidates for the Army Medical Service, upon which the Board officially inquired of the General Medical Council whether or not the L.A.H. was a recognised medical diploma. Then, and year after year, on subsequent repetition of the query, the Medical Council returned what was practically a negative reply; and, consequently, the L.A.H. still remained a pharmaceutic license *et preterea nihil*, and it was not recognised as a medical qualification by the Army or the Poor-law authorities, or by any one else. Just at that time arose a difference of opinion between the Irish Colleges of Surgeons and Physicians, one College (we forget which) refusing to conform to some studential requirement which the other thought necessary, and it occurred to those in power in the College of Surgeons that it would be a safe move to establish the L.A.H. as a medical license, in order that it might serve as a set-off against the College of Physicians in the event of future disagreements. In conformity with this policy, Mr. Hargrave, who was then the representative of the Irish College of Surgeons in the Medical Council, and who had repeatedly voted and spoken against the recognition of the L.A.H. as a medical diploma, changed his opinions, and carrying with him Dr. Embleton—the representative of the University of Durham—turned the scale in favour of the Apothecaries Hall, when the annual vote upon that body's pretensions came to be taken in the next meeting of the Medical Council. Thus, by the shift of ground of the Irish College of Surgeons and Mr. Hargrave, not by a change of law, or by a *bonâ-fide* alteration in the opinion of the Council, the L.A.H. became a registrable medical diploma, and, an affirmative reply being at length given to the Army Board, was accepted by them, and,

Digitized by Google

afterwards, by the Poor-law Commissioners. This is the history of the matter, and, we think it justifies our assertion that the Hall gives its licences—as medical qualifications—"without the smallest legal right to do so." Nevertheless, since that day, the L.A.H. has been registered and accepted by the public services as a medical degree, and—no doubt—will continue to be so accepted until some one disputes, legally, the right of the Hall to grant a medical degree. Although we are distinctly of opinion that the coming Medical Act ought not to include in its Schedule of Registrable Medical Degrees the license of the Dublin Apothecaries Hall, our contention at present is that the "Hall," although recognised as a medical licensing body, has not sufficient share in medical education or qualification to deserve that it should vote in the Medical Council, and that supposing the Licentiate Apothecaries to have a fair right to be represented in the Medical Parliament, it cannot be said that they have—at present—any voice whatever in that body. The representative of the Irish Apothecaries Company is not elected by the Licentiate Apothecaries. We are not aware that he has knowledge of their views, or that they have any influence whatever over his acts. He is the chosen of some fifteen respectable commercial gentlemen, who hold shares in a drug company; and the *rôle* thus confided to him, we are bound to say, he fulfils to perfection. But it is, perhaps, hardly worth entering upon a crusade against the Irish Apothecaries Company, for if the Conjoint Scheme should be adopted, "the Hall" will cease to exist as a licensing body. Already it has been superseded as a pharmaceutic qualifying institution by the Pharmaceutical Society of Ireland, and, should conjoint examination be made law, it will no longer be permitted to grant half-guinea licenses, and will cease to possess the attraction of cheapness.

The Mortality of Great Cities.

In the principal cities of the United Kingdom, the rates of mortality per 1,000 last week were—Plymouth 11, Brighton 13, Portsmouth 13, Sunderland 14, Nottingham 14, Leicester 15, Bradford 15, Glasgow 16, Bristol 16, Hull 16, Wolverhampton 16, Birmingham 16, Leeds 17, London 17, Oldham 17, Edinburgh 18, Sheffield 18, Norwich 18, Salford 19, Liverpool 20, Manchester 20, Newcastle-upon-Tyne 22, and Dublin (including 51 deaths prior to July 1st), 29.

In the principal foreign cities the rates of mortality, according to the most recent weekly returns, were—Calcutta 27, Bombay 29, Madras 34; Paris 22; Geneva 22; Brussels 20; Amsterdam 21, Rotterdam 26; The Hague 23; Copenhagen 20; Stockholm 17; Christiania 15; St. Petersburgh 37; Berlin 46, Hamburg 22, Dresden 27, Breslau 32, Munich 30, Vienna 26, Buda-Pesth 38; Rome 21, Naples 31, Turin 26, Venice 25; Alexandria 43; New York 23, per 1,000 of the population.

Thus it appears that Dublin is, by a large margin, the most unhealthy of the 23 cities whose death-rate is recorded by the Registrar-General. It is also (with five exceptions), the worst of European cities, and nearly as insalubrious as the worst of the tropical seats of miasm.

It must not be supposed that this is an exceptional state of things. On the contrary, the death-rate of Dublin, though augmented by 51 deaths which did not occur within the week, is as low this week as it usually is, and much lower than it has recently been.

What shall we Drink?

Judging from a quotation made by an esteemed contemporary, Dr. Bock, of Leipsic, has been writing a good deal of nonsense on the moral effect of different articles of food and drink. He says, "the nervousness and peevishness of our times are chiefly attributable to tea and coffee; the digestive organs of confirmed coffee drinkers are in a state of chronic derangement, which reacts on the brain, producing fretful and lachrymose moods. Fine ladies addicted to strong coffee have a characteristic temper, which I might describe as a mania for acting the persecuted saint. Chocolate is neutral in its physical effects, and is really the most harmless of our fashionable drinks. The snappish petulant humour of the Chinese can certainly be ascribed to their immoderate fondness for tea. Beer is brutalising, wine impassions, whisky infuriates, but eventually unmans."

It is surely time that some stop was put to the tirades that are continually being made against the various beverages the public are in habit of consuming. We are told by the chemists that much of the water supplied to us is scarcely fit for drinking. The total abstainers, even including the Medical Temperance Association, tell us we should abstain from all kinds of alcoholic liquors, and now a German doctor would have us believe that even the tea or coffee drinker cannot partake of his favourite infusion with impunity; and that he who is addicted to strong coffee may be observed to have a characteristic temper, and to be in the habit of falling into fretful and lachrymose moods! On what authority, moreover, does Dr. Bock state that people are more nervous and peevish now than they were formerly? and by what sort of logic does he connect this assumed nervousness with the drinking of tea or coffee? And yet this is the sort of temperance cant to which we have to listen in these degenerate days, and which makes many of our total abstinence orators appear so ridiculous as to defeat the very object they have in view. Let us have done with all this refinement about the effects of this drink and that drink. Let the people take what they like and what they find best to agree with them, provided they do not indulge in strong spirits, and are temperate in this, as they should be in all other things that contribute to the support or to the pleasures of life.

Another Proposed Licensing Body.

In reference to the proposed Victoria University, several teachers in the London and Provincial Medical Schools have, in a memorial to the Privy Council, protested against the power of conferring licences to practice medicine or surgery being granted to this university on the grounds:—1st. That there already exist nineteen such corporations; 2nd. That the competition arising out of this number of licensing bodies is detrimental to the public and the medical profession, as tending to lower the standard of medical qualification; and 3rd. That the Manchester

Digitized by Google

School of Medicine has no superior claims over other schools in London or the provinces which can entitle it to such a special distinction as that of conferring degrees to practise medicine or surgery.

It is certainly not desirable that another licensing body should spring up at a time when everything is being done to diminish the number of those at present existing. At the same time, if the proposed university is established, and is put on a footing with other institutions of the same kind, it is hardly fair that it should be deprived of one of those privileges which have always been granted to other universities. Were a Conjoint Board to be formed, the granting of licenses by the proposed university would not be very objectionable, and in any case the difficulty might be got over by only giving it the power of granting the higher degrees, such as those of doctor of medicine or master of surgery. Such degrees would be chiefly taken by those who intended to enter upon the higher walks of the profession, and could not possibly either lower the standard of medical education or clash with the interests of other licensing bodies.

Diphtheria at Barnstaple.

So careful are the sanitary authorities now to inquire into any unusual outbreak of an infectious disease that Dr. W. Ogle was commissioned by the Local Government Board to inquire into the circumstances under which six deaths from diphtheria had occurred in the Barnstaple rural district during the latter part of the year 1878. We cannot say, however, that his investigations were attended with much success. The six cottages attacked were widely separate. They had apparently nothing in common. Each had water from a totally different well, nor could the origin of the outbreak be traced to any impurity in the water. Neither had the six cottages their milk from the same farm, nor did there appear to be any disease prevalent among the cattle. One condition, and one only, was common to them all, namely, that the children attacked attended at the same school, and when this school was closed the outbreak almost at once came to an end. But what defect there was in the sanitary condition of this school or its surroundings to give rise to the epidemic, Dr. Ogle does not state, or perhaps could not discover. All he says on this point is:—"I find that the school-girl who fell ill in cottage D, sat next to one of the two girls from cottage A, who probably, as I think, introduced the infection." The high rate of mortality among the cases is attributed to want of "good nursing," a circumstance which shows the necessity of having small rural hospitals for the isolation and proper treatment of the sick.

The Royal Free Hospital.

We are glad to see that the Fifty-first Annual Report of this useful hospital, which has just been issued, is of a satisfactory nature, inasmuch as it has special claims upon the charity of the public. Previously to its establishment there was no institution in the Metropolis where destitute strangers, when overtaken by sickness or disease, and unable to move about, could find an asylum for their immediate reception. During each year great numbers of the destitute sick, on their own application, are received into the wards of this hospital; and since its foundation in 1828 up to the 31st of December, 1878, 1,674,385 have obtained relief by its means. It appears that, notwithstanding the numerous special and exceptional claims upon the public benevolence, and the great commercial depression, the receipts from all sources during the past year amounted to £10,403 14s. 2d. The hospital has also been fortunate the last two or three years in receiving some good legacies. Thus, in the years 1876, 1877, and 1878, the legacies amounted to upwards of £18,383, £14,037, and £5,312 respectively. The subscriptions, however, have slightly fallen off, for whilst those for 1876 and 1877 were upwards of £1,200 and £1,228 respectively, in 1878 they were only £1,177 14s. 6d. The new Victoria wing, containing three spacious wards and the out-patient department, has been in full operation during the year. The number of in-patients amounted last year to 1,243, the average daily number having been 95, as against 74 in the preceding year, when the new wing was in course of construction.

Working of the Unification System in the Afghan War.

An old Surgeon-Major, writing from India to the *Irish Times*, refers to the experience afforded by the Afghan campaign as conclusively favourable to the unification system. He says that in no campaign before has the British soldier ever been so well cared for as in the Afghan war just concluded. The system of base hospitals into which the sick were evacuated from the front, left the force of the fighting line unencumbered to advance at any moment, and the field divisional hospitals were so organised that at an hour's notice the General could depend on a force being supplied with every possible medical necessity, no matter whether 100 or 1,000 men were sent out. The expense to the State was about half what the old regimental system would have entailed, and the carriage for ambulance purposes was less than half, and what is better there was always sufficient and at hand when required. Had the system that is now in force been in operation in the Crimea, he considers that literally thousands of lives would have been saved which were sacrificed to want of organisation, or, to put it plainly, to the faulty system of regimental hospitals. "I have been (he says) most of my service a regimental officer, and I freely admit that both the medical officers and army at large have lost largely from a social point of view by the unification system; but I assert that the sick soldier and the State have both largely gained by the change."

Mr. Thomas H. Powers, the chief maker of American quinine, died some six months ago and left a fortune estimated at not less than 10,000,000 dollars. The *Philadelphia Medical Reporter* adds:—"Very much of this was made on quinine, and the movement to repeal the duty on that drug is one which should meet the approval of all unbiassed physicians. At present the sick are obliged to pay more than twice as much for this medicine as they would were the duty removed. This excess goes into the pockets of the already enormously rich manufacturers. It is a striking instance of the gross injustice of protective duties. In fact, it is encouraging a monopoly of the most unfair description."

Homœopathy Gone Mad.

We published recently an arithmetic calculation of the extent of some of the dilutions which are recommended by certain homœopathists as unfailing talismans against disease. A writer in the *Hahnemannian Monthly*—himself a homœopath—follows our correspondent with a few more figures illustrative of the "potency" of homœopathic medicines (?) He says, "Suppose the crude medicinal substance to be represented by a No. 3 homœopathic pellet, the first attenuation would be represented by an acorn, the second by an orange, the third by a pumpkin, the fourth by a hogshead, the fifth by a large room, the sixth by a church...the twelfth by the Mediterranean Sea ...the fifteenth would be eight times as big as the earth... the eighteenth six times as large as the sun...the twenty-fourth twenty-three times as large as the solar system... the thirtieth would be as large as fifty-six spheres whose diameter should reach from the extremity of our solar system to the nearest fixed star. It would take one fifty-six times 230,000 years to travel round these spheres at the rate of 1,000 miles per minute. One drop of liquid measuring the tenth of an inch in diameter raised to the 30th dilution would contain 2,058,510,642,141,870,000, 000,000,000,000,000,000,000,000 cubic miles.

How to Stop a Cold.

Dr. Dobell gives the following plan for stopping a cold. If employed sufficiently early it is said to be almost infallible :—1. Give 5 grains of sescarb. of ammonia and 5 minims of liquor morphine in an ounce of almond emulsion every three hours. 2. At night give jss. of liq. ammon. acetatis in a tumbler of cold water, after the patient has got into bed and been covered with several extra blankets. Cold water should be drunk freely during the night should the patient be thirsty. 3. In the morning the extra blankets should be removed so as to allow the skin to cool down before getting up. 4. Let him get up as usual and take his usual diet, but continue the ammonia and morphia mixture every four hours. 5. At bed-time the second night give a compound colocynth pill. No more than twelve doses of the mixture from the first to the last need be taken as a rule ; but should the catarrh seemed disposed to come back after leaving off the medicine for a day, another six doses may be taken and another pill. During the treatment the patient should live a little better than usual, and on leaving it off should take an extra glass of wine for a day or two.

Local Authorities and the Sanitary Act.

That the Sanitary Act is a dead letter in many districts few of our readers will be inclined to question, and medical officers of health are frequently tolerated as a necessity, or their recommendations altogether ignored. We have now before us the annual report of Dr. Bates, Medical Officer of Health for Cowbridge, Glamorgan, in which he openly expresses his regret that the Corporation of Cowbridge takes so little interest in sanitary matters, especially with regard to a sufficient supply of pure water for the inhabitants. As, however, the district under his charge shows an exceptionally low death-rate, one of 13·50 per 1,000 of the population, we presume his recommendations will go unheeded after the manner customary with local authorities, until the outbreak of some epidemic, and then "who would have thought it," will be the hue and cry.

The "Irish Medical Directory," 1880.

By an advertisement in our columns to-day it will be perceived that the Annual Circular for the year 1880, has now been forwarded for correction to every legally-qualified member of the profession residing in Ireland; the Editor has made arrangements which will enable him to have the next issue of the work ready on the 1st of January, and asks the assistance and support of the profession, believing that on its merits it well deserves approval, and that its yearly publication is of material benefit and convenience as a book of reference for the medical profession.

We trust that the profession will attend to the Editor's request, and assist him in every way in the compiling of this useful work and immediately return their annual circular, and thus spare him the unnecessary trouble and expense of the issuing of a second application.

Treatment of Tonsillary Hypertrophy.

Dr. Quinant, in the *Union Médicale*, recommends *massage* of the hypertrophied tonsils in non-inflammatory cases. He passes the index finger covered with powdered alum back to the tonsils, and compresses and "kneads" them. This done, the patient gargles with a mild astringent, and at the end of two or three days is able to perform the operation for himself. Dr. Quinart asserts that by this means he is able to resolve the hypertrophy and avoid excision of the glands.

Irish Contract Drugs.

We warmly approve of the determination of the Newcastle (co. Limerick) Guardians, advertised by them in connection with their half-yearly drug contracts, that "the medicines will be analysed by Dr. Cameron, and, if found inferior, the contractor will be prosecuted." If all we have heard about contract drugs be true, and if all guardians be as wise as those of Newcastle, we opine that Dr. Cameron and the County Court judges will have their hands full.

Yellow fever is not increasing, as was feared, in the Southern States of America with the exceptionally hot season prevailing in those parts. There were only thirty-four deaths from its ravages last week in Memphis, two in Shelbyville, and four in Louisville. The panic has subsided, and people are returning to their homes.

The lay press still persist in styling the man charged with procuring abortion in the person of Ellen Saunders, as Dr. Francis Hammond, F.R.C.S. We have already stated, and our contemporaries have followed suit, that the said individual is neither on the Register nor the Medical Directory, and the persistence in publishing reports week after week under this false heading, is nothing less than a libel on the profession to which he is falsely assumed to belong. We may add that Francis Hammond is still in custody, bail being refused.

Digitized by Google

Dr. Frankland reports that the Thames water delivered by the West Middlesex, Southwark, and Grand Junction Companies during the past two or three weeks was so much polluted by organic matter as to be quite unfit for dietetic purposes. The first-named company delivered inefficiently filtered water, containing moving organisms. The Chelsea and Lambeth Companies, drawing their supplies from the same source, sent out water of much better quality; that of the Chelsea Company, however, was inefficiently filtered, and contained moving organisms.

The death-rate from the seven principal zymotic diseases averaged 2·5 per 1,000 in the principal large towns last week. Scarlet fever showed the largest proportional fatality in Salford, Sunderland, and Sheffield; and measles in London and Bradford. The 14 deaths referred to fever were considerably below the average. Small-pox caused 6 more deaths in London, 8 in Dublin, but not one in any of the other large towns. The fatal cases of diarrhœa in these towns were but 47 last week, against 669, 243, and 602 in the corresponding weeks of the three years 1876-77-78.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Glasgow Death-rate.—The death-rate of Glasgow for the week ending the 19th July was at the rate of 16 per 1,000, as against[22 the previous week. The rate in the corresponding week of 1878 was 29, of 1877, 24, and of 1876, 26 per 1,000. The Medical Officer of Health, in noting this circumstance, considers that the unseasonably low temperature is preventing the development of the characteristics of summer mortality, and retaining in a slight degree those of the winter. Part of the extreme healthiness of this year among infants arises from the diminished prevalence of whooping-cough, and partly from the low temperature, which, while it keeps down diarrhœa, keeps up pulmonary diseases.

North of Scotland Medical Association.—The annual meeting of the North of Scotland Medical Association was held in Aberdeen on the 19th July, Dr. Greig, sen., Fyvie, presiding. A committee was appointed to meet a committee of the Aberdeen, Banff, and Kincardine Branch of the British Medical Association to consider what steps should be taken in the way of effecting a union between the two societies. Dr. Will reported that a committee on the subject recommended that the University representatives in the Medical Council should be elected by the several councils of the universities, instead of by the senators, as at present, and that members and licentiates of other medical corporations should elect their representatives directly in place of the councils of these corporations. After some criticisms from Professors Stevenson and Struthers, the matter was remitted back to the committee for further consideration, with power to petition Parliament on the subject.

Edinburgh School of Pharmacy and Chemistry.—The Summer Session of this School was closed on the 23rd inst., with the distribution of prizes and certificates gained by students, and with an address by the Rev. Dr. Teape, who presided. Dr. Teape, in the course of his address, stated that this was the first School of Pharmacy and Chemistry established in Scotland, and its primary object had been to give instruction to pharmaceutical students. Since its foundation, however, it had been developed into a medical school, with such results as had called for additions to the medical and teaching staff, and for additional class and other accommodation, which it was in contemplation to provide. From the dispensary of the school, which was conducted on the provident principle, about 300 cases of ordinary surgical and medical practice, and 198 cases of midwifery had been attended since November last; and the class which Mr. Urquhart had conducted at the Royal Dispensary he would henceforth carry on in this school. Dr. Charles Bell, the Lecturer on Midwifery, and Dr. Paterson, who had conducted the examinations of the students of the school, spoke in high terms of the proficiency which had been displayed by those who had presented themselves for examination. From the prize list it appears that the first prizeman in Dr. Bell's midwifery class was Mr. Stoors, Canada, and the second, Mr. Short, Chulmleigh, Devonshire, to both of whom L.M. diplomas were awarded. In the class of pharmacy, Mr. David Hepburn gained the first, and Mr. A. G. E. Naylor the second, prize. In the class of materia medica the first prizeman was Mr. G. Waters, and the same gentleman gained the first prizes in the classes of practical and theoretical chemistry, conducted by Dr. Drinkwater. The proceedings were closed with the usual vote of thanks to the chairman.

Freemasons and the New Royal Infirmary, Edinburgh.—A meeting of the Masters of Edinburgh Lodges and, other leading members of the masonic craft was held in the Freemasons' Hall, on the 23rd inst, for the purpose of considering as to the organisation of a subscription, with the view of furnishing a ward in the Edinburgh Royal Infirmary, to be called "The Freemasons' Ward." There was a good attendance, and Mr. Hugh Munro, Master of Lodge Journeymen, occupied the chair. On the motion of Mr. Alexander Hay, Past-master of Lodge "Celtic," seconded by Sheriff Thoms, it was unanimously resolved to commence a subscription for the purpose in question, and the Grand Secretary, Mr. D. Murray Lyon, agreed to act as honorary secretary and treasurer for the movement, which is under the patronage of Sir Michael Shaw-Stewart, Bart.

Edinburgh University Buildings Extension.—Mr. R. Bruce Johnston has received intimation of a bequest of £500 to the Edinburgh University Building Scheme, by the late Mr. H. G. Watson, C.A. It appears that while it is anticipated that the fund which has been raised by subscription will, along with the Government grant, prove adequate to the erection of the new educational buildings, a large additional sum will be required to enable the Committee to proceed with the great hall and tower.

Deaths of Boys from Singular Causes.—During this week two young boys have died at Coupar, Fife, from singular causes. One of them, aged ten, swallowed a halfpenny in school in February last, and, although serious consequences were not anticipated, he gradually lost his appetite. Ultimately he vomited a good deal of blood, and on Tuesday evening last suddenly became insensible, and expired in a short time thereafter. The other case, that of a boy, seven years of age, while playing barefooted on Thursday last, his foot was cut with a piece of glass. Although every effort was made to close the wound, this could not be effected, and the blood flowed continuously until death ensued the following Sunday.

Death of Dr. Kinloch, of Park.—Dr. Alexander John Kinloch died at his residence of Park House, Deeside, on Saturday, the 19th inst., at the age of 61 years. Dr. Kinloch

Digitized by Google

was the youngest son of Mr. Alexander Low, lessee of the Dancing Cairns Quarries, and changed his name on succeeding to the fortune of his uncle, Mr. James Kinlock, merchant, Bombay. Before succeeding to the property, Mr. Kinloch had begun the study of medicine, and took the degree of M. D., at Edinburgh. Though not practising publicly, Dr. Kinloch gave his tenantry the benefit of his advice, and spent much of his spare time in scientific research. The deceased gentleman was much esteemed as a proprietor.

Literature.

SURGERY OF THE FACE. (a)

THE above volume is dedicated by Mr. Mason to the President Council, and Fellows, of the Medical Society of London, and comprises the Lettsomian Lectures delivered during the Session 1877-8.

We owe Mr. Mason our apology for having allowed his interesting lectures to remain so long unnoticed. The first lecture is devoted to Diseases of the Face, and after briefly noticing some of the skin diseases which are found in this neighbourhood, he gives us some interesting cases illustrating the numerous kinds of swellings and tumours which so often tax the diagnostic skill of the surgeon. Having briefly illustrated the different varieties of abscesses and ulcers, not forgetting those rare, but interesting cases, due to the inoculation of the syphilitic poison, he points out the differential diagnosis between cysts and other tumours. Among the cases mentioned, are a glandular tumour of the lip, and a very large tumour removed from a man's neck by Sir William Fergusson, which weighed 9¼ lbs.; another, of which a microscopical drawing is given, which shows it to be a melanotic sarcoma, was removed in 1872 from the face, and has not returned up to the present time. The different kinds of tumours affecting the jaws are alluded to, and illustrations given of cysts of the lower and upper jaws. In removing growths from the upper jaw when they are large, Mr. Mason, we are glad to see, follows Sir William Fergusson's teaching, and recommends an incision in the middle line of the lip running into the nostril along the side of the nose, and then horizontally outwards below the margin of the orbit, in preference to the incision from the angle of the mouth running upwards and outwards, which we have seen practised, but which had better be abandoned in favour of the first-named incisions, which leave very little scar, and effectually expose the parts, and spare the facial nerve as much as possible.

The different methods of treating nævi are passed in review, and diagrams illustrating the different kinds of knot used for the purpose of ligaturing them are plentifully given.

Lecture II. considers injuries of the face. Mr. Mason prefers to bring wounds of the face together with strapping, and when sutures are needed prefers fine silk to silver wire; in wounds of the lips the hare-lip needles are to be used. In the treatment of burns and scalds the following application is recommended: one part of acetic acid is mixed with twelve of water, and whiting is added until the fluid becomes of the consistence of cream. This mixture is to be applied lightly with a brush during effervescence, and in addition the part is usually covered with soft linen and cotton wool. It is recommended that in those cases where the patient has been so unfortunate as to have a portion of the nose completely severed from the body, the part is to be carefully stitched to the face.

Mr. Mason speaks favourably of Mr. William Adams's operation for the restoration of the nose when displaced by injury to the nasal bones. Several ingenious methods for bringing the fractured ends of bones together are explained and illustrated. An interesting case is given of removal of a portion of the lower jaw for immobility caused by a dense cicatrix. A patient was shown who had been accidentally shot fifteen months previously behind the left ear; the bullet had not been removed, and there was a discharge from the ear, and well-marked facial paralysis. The presence of the metal was demonstrated by Dr. Stone by means of a cleverly constructed electrical apparatus. Cases illustrating the presence of foreign bodies in the orbit and face are quoted, not the least interesting of the series, being Dr. George Johnson's case, in which tetanus, with facial neuralgia and palsy, and a recurrence of epilepsy were excited by a foreign body embedded in the cheek; in cutting down through the cicatrix a sharp angular piece of flint, nearly as large as a grain of wheat, was discovered and removed. After the operation the symptoms gradually passed away.

Lecture III. treats of deformities of the face. After referring to the different varieties of hare-lip and cleft palate, Mr. Mason gives some examples of congenital deficiencies of bones of the face, &c., and points out the importance of a correct diagnosis in cases of meningocele.

The subject of malformation of the ears and jaws is a most interesting one, and well illustrated by the examples given. After a few remarks on maternal impressions, cicatrices and deformities left by burns are considered, and the methods recommended for their amelioration carefully described and illustrated by numerous woodcuts.

The important subject of restoration of a lost nose has a section devoted to it, and the different writers on the subject are freely quoted. The lecture concludes with a description of the operative procedures necessary for the restoration of eyelids. Mr. Mason's object in delivering these lectures, was not to give a complete treatise on the surgery of the face, for that was obviously impossible in the three lectures before us, but to deal with the subject from a practical point of view, and make it both attractive and interesting; and having, in our opinion, succeeded in his endeavour, we recommend his lectures to our readers.

(a) "Surgery of the Face." By Francis Mason, F.R.C.S., Surgeon and Lecturer on Anatomy at St. Thomas's Hospital, Hon. Fellow King's College, London, &c. London: J. and A. Churchill, New Burlington Street. 1878.

THE NATURE OF LIFE. (a)

THIS is the second edition of a smaller work that appeared a year or two ago under the title of "The Simplicity of Life." The object the author has in view is that of explaining the nature of living action in organic beings, and the similarity of such actions in health and disease. In short, it is an attempt to carry the views enunciated by Dr. John Brown in the last century, that "health and disease are the same states, differing only in degree," and which subsequently received a lucid and precise explanation from Fletcher, who reduced all morbid actions to one and the same law or general expression. Dr. J. Brown rather formulated the axiom, which was a truth recognised by the earliest writers on medicine. Dr. Richardson has enlarged upon the views of the fathers of our profession, and he further discusses the nature of living action in all organic beings, the similarity of such actions in health and disease, and their analogy, he tells us, "with those included in the term gravitation." We should here remark, however, that whilst he would refer the nature of every disease "*to a law* as simple *as that of gravitation*," we are told by an author of repute, quite recently, "that the currently received theory of the gravitation of inert matter is not only incorrect, but inconsistent with the real circulation of living matter, and that our views on this subject must be revised and remodelled." So that in the treating of vital action, this will be found a subject that once more demands attention, and in undertaking to deal with such transcendent topics, it is but fair to Dr. Ralph Richardson to say that he has taken considerable pains to lead his readers up to the living actions in health or physiology in its more restricted sense, and the similarity of such actions in disease. He believes, with Dr. Samuel Dickson, "that disease is neither a devil to be cast out, a humour to be expelled, nor an acrimony to be blunted; neither is it an acidity to be neutralised, nor a putridity to be chemically solved. It is neither more nor less than a state to be altered, a variation from a healthy condition of body."

Dr. Richardson's volume bears evidence of a vast amount of careful research, and he has consequently brought together an immense number of facts bearing upon this question, and whether the views he so tersely propounds be right or wrong, the physiologist and physician will find them well worth attentive consideration.

SEMPLE ON DIPHTHERIA. (a)

THERE are perhaps few living physicians better qualified to write a treatise on diphtheria than Dr. Semple. It is a disease which has, both theoretically and practically, occupied his attention since the year, 1857. In the following year the author collected and translated for the Sydenham Society the well-known "Memoirs on Diphtheria." Since that time he has devoted much time and labour to the elucidation of the pathology of this disease; while more recently his name has been closely associated with the controversy respecting its connection with the affection commonly called croup. Instead, however, of writing a bulky treatise on diphtheria, Dr. Semple has been contented with the more modest task of publishing a reprint of his first Memoir, of 1871, and second Memoir, of 1872, to which is now added an appendix on "The Relations between Diphtheria and (so-called) Croup, and other important Questions connected with the subject." But the bulk of a volume is no criterion of the value of its contents, and in this little work of seventy pages the reader will find a good and interesting repertory of all that is known respecting the history, causes, diagnosis, pathology, and treatment of diphtheria.

With regard to the pathology of the disease, the author remarks—"It may be stated in general terms that the essential feature of diphtheria consists in the production of a pellicular exudation on some part of the surface of the mucous membrane, or of the skin." But the "nature of the membrane itself is not yet very clearly ascertained, and neither general theoretical considerations of pathology, nor accurate microscopical examinations have hitherto thrown much light on the subject." Nor, on the whole, can it "be said that the inflammatory character of the deposit is yet established." The premonitory symptoms are not very characteristic of inflammation. "The pulse is usually rapid, but very weak, and the symptomatic fever is sometimes so slight that the patient scarcely seems ill at all in the early stages of the complaint. . . . . While hesitating, therefore, to deny altogether the inflammatory origin of diphtheria, I can by no means admit it to be of such a nature. It seems to me to be a disease *sui generis*, consisting in some peculiar morbid condition of the mucous membrane, and occasionally of the skin, but not necessarily characterised by the phenomena, generally classed under the head of inflammation." He also regards it as a constitutional disease. "Its appearance on the skin, also on raw or blistered surfaces, clearly indicates the presence of some specific deleterious agent introduced into the blood." Some may think that these views are not what might have been expected of a writer who is strongly convinced of the identity of croup and diphtheria, but it must be borne in mind that it is only the membranous variety of so-called croup which Dr. Semple considers to be identical with diphtheria.

Coming to the subject of "Treatment," the author places most importance upon constitutional remedies. As he justly observes, "the disease undoubtedly affects the whole system, and it may be broadly stated that, although accompanied by feverish symptoms, it is adynamic in its character." Hence, from the very first, tonic and alterative treatment should be adopted. The tincture of the perchloride of iron, alone or in combination with quinine, should be prescribed, the patient having, at the same time, a liberal allowance of food and stimulants. With regard to stimulants, the experience of the author is in accordance with that of most of his professional brethren. "In a successful case attended by myself brandy was frequently administered every day to a young girl, not only without bad effects, but with great benefit, and I never hesitate, however young the patient, to recommend and insist upon the free, and even forcible, employment of alcoholic stimulants." The author's remarks on the local treatment of this affection, on the remedies to be employed when it attacks the larynx, and on the question of tracheotomy, are equally judicious and practical. We can, therefore, strongly recommend the book to anyone who wishes to read a concise and interesting account of the nature, diagnosis, and treatment of a disease which is not only constantly raging epidemically, and with great fatality in various parts of Europe, but has been recently attracting more than usual attention.

(a) "On Diphtheria; its Nature, Varieties, Pathology, Diagnosis, and Treatment." By Robert Hunter Semple, M.D., F.R.C.P., &c., &c. London: Baillière, Tindall, and Cox. 1879.

Medical News.

Royal College of Surgeons of England.—The following candidates for the M.R.C.S., having passed the required examinations, were admitted at meetings of the Court of Examiners last week:—

Ballance, Charles Alfred, Lower Clapton.
Bennett, Frederick Joseph, George Street, W.
Booth, Thomas Carter, Staleybridge.
Bowman, Hugh T., M.B. Durham, Newcastle-on-Tyne.
Challinor, Samuel M'Millan, Bolton.
Cowen, W. A. Daniel, L.R.C.P. Edin., Gosport, Hants.
Cumming, G. W. Hamilton, L.R.C.P. Edin., Exmouth.
Dale, B. Hague, Scarborough.
Dales, William, Sheffield.
Davidson, John, L.S.A., Kilburn.
Dimmock, Henry Peers, Moore Street, Chelsea.
Dodd, John Richard, M.D. Dub., Newcastle-on-Tyne.
Fisher, Frederick Charles, Cadogan Place.
Flanagan, H. E. Bickerson, L.S.A., Woolwich.
Foster, William, Bradford, Yorkshire.
Frakes, Henry Sowter, Manchester.
Goodridge, E. W. Gostwick, Child Oakford.
Grace, William Gilbert, L.R.C.P. Edin., Acton.
Harbord, Edward Augustus, Wainfleet.
Hamilton, Seton Guthrie, Queen Anne's Mansions.
Havens, Edward John, L.S.A., Colchester.
Hodgson, John, Oldham.
Ho Kai, M.B. Aberd., Hong Kong.
Holland, Edward Wilmot, Bath.
Huxley, Frank Earle, Birmingham.
Lewis, J. G. Stephen, L.R.C.P. Lond., Ealing.
Maile, Charles E. Drayson, L.R.C.P. Edin., Faversham.
Maitland, Charles Bradley, Haymarket.
Manners, Arthur, Hull.
Marsden, James Cort, L.S.A., Madras.
Martin, Edward Fuller, M.D. Edin, Weston-super-Mare.
Mellor, Thomas, L.S.A., Bury, Lancashire.
Milne, James Kershaw, Manchester.
Payne, Henry, Bolton.
Peck, Francis Samuel, Clifton, Bristol.
Pegler, L. W. Hennington, M.B. Edin., Colchester.
Porter, Thomas Morrison, Liverpool.
Pritchard, Samuel Evan, L.S.A., Beaumaris.
Smith, Ernest Barratt, M.B. Aberd., John Street, Berkeley Square.
Smith, Henry Strode, Axbridge, Somerset.
Sprott, William John, M.D. Dub., Dromore, co. Down.
Teskey, Luke, M.B. Toronto, Toronto, Canada.
Warburton, Arthur, Crewe.
Webb, Chas. Alfred, L.S.A., Drightlington, Yorkshire.
Whitehouse, John, Smethwick.

Anonymous Munificence.—At the last meeting of the Governors of the Chelsea Hospital for Women, the Earl of St. Germans (the President) received at the hands of the Rev. Canon Fleming (one of the Board of Management) an anonymous donation of £1,000 towards providing furniture for the new Hospital. In the spirit of true charity it is given on the express condition "that no name is mentioned," it being simply acknowledged as "from a Friend, per Rev. Canon Fleming."

Death from Minute Dose of Strychnia.

A STUDENT of the laboratory of the Ecole de Pharmacie relates, in the *Union Med.*, the fact that a cat belonging to the laboratory died in a few minutes after some convulsions, having eaten a small bird which had been employed in an experiment with strychnia. Still, Prof. Jeanjean had only deposited in the corner of the eye of the bird scarcely a milligram of the acetate of strychnia.

Cure for Obstinate Vomiting.

THE *Practitioner* says that the spirit of walnut (*spiritus nucis juglandis*), given in drachm doses three times daily, has checked vomiting after other remedies had failed.

Jaborandi in Obstinate Hiccough.

DR. ORTILLE, of Lille, communicates to the *Bull. de Thérapeutique* the case of a woman, æt. 56, who came under his case for hiccough, which had lasted for seven months. The hiccough was almost continuous, at the rate of thirty or forty a minute, and was accompanied by vomiting. Occasionally there were intervals of five or ten minutes. Various remedies had been tried in vain, and now a decoction of four grains of the leaves and

Digitized by Google

stalks of jaborandi was prescribed in two doses, to be taken with an interval of a quarter of an hour. The usual sweating and transpiration were produced, as was some vomiting, and in two hours the hiccough had ceased.

Unusual Source of Lead Poisoning.

AN interesting case of lead poisoning through criminal negligence is reported from America. The patient began to suffer some years ago, and consulted in vain. The poisoning was caused by imperfectly-tinned lead snuff-boxes, in which a particular brand of snuff was packed, which the patient was in the habit of buying from one and the same manufacturer, and which became contaminated with lead. A suit against the tobacco dealer was filed, who was convicted and sentenced to incarceration for eight days and payment of costs.

Native Chinese Medicine.

DR. KEATING (Philadelphia), who accompanied General Grant during his Chinese tour, in a conversation on Chinese hospitals remarked :—

"On numbers of the patients I observed little blue spots, and I thought I was about to learn of some peculiar disease. Upon inquiry, however, I found that they were caused by the Chinese mode of treating internal inflammation. The poor fellows who bore the blue marks had been treated for sore throat, by having the skin of their necks taken by the physician between thumb and forefinger and screwed around."

This reminds us that several years ago Dr. Jameson, of Shanghai, when writing on the subject of obstetric medicine among the Chinese, published some statistics to prove that in a Chinese woman the physiological processes of utero-gestation, and parturition are so closely surrounded by the dangers arising from no-management and mismanagement that pregnancy becomes a pathological condition but one-half less formidable than typhus fever in England.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," 'Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

MESSRS. J. & A. CHURCHILL.—The fact has slipped our memory. Thanks for drawing our attention thereto.

REMEDY FOR SEA SICKNESS.—Should any of our readers feel inclined to try it, the following is the latest *recipe* culled from a Liverpool paper :—Mix together in a pint of water—Lard, ½ lb. ; Sealing-wax, 1 oz. ; Cobblers'-wax, 1 os. ; Magnesia, 20 grains ; Sulphuric acid 3 drachms. Take one teaspoonful every ten minutes.

DR. WOLFENDEN is thanked.

MR. JESSEL.—One of the publications of the Smithsonian Institution at Washington. You can only get it by writing to the librarian.

DR. B. G. will observe that the matter is referred to in another column.

MRS. PARTINGTON has been reading the health officer's weekly reports, and thinks "total" must be an awful malignant disease, since as many die of it as all the rest put together.

MR. SEAMAN.—Not sufficiently medical for our columns.

ENQUIRENS.—Another gentleman of the same name.

A MEMBER OF THE ASSOCIATION.—We shall be duly represented at the Cork meeting.

A COLONIAL CANDIDATE.—Either of the four leading surgical text-books will answer your purpose—Gants', Bryants', Erichsens', or Holmes's. Each has its strong points, according to the bent of the author.

MR. F. R. FISHER.—Letter received, and will appear in our next with editorial foot-note.

A NAVAL CANDIDATE.—The examinations are held at the University of London on Monday, August 11th, and following dates. You must signify your intention to present yourself the Thursday previous.

VACANCIES.

Carrick-on-Suir Union, Piltown Dispensary.—Medical Officer. Salary, £100, with fees, and £20 as Medical Officer of Health. Election, August 14. (See Advt.)

Croydon General Hospital.—House Surgeon. Salary commencing at £80, with board, &c. Applications to the Hon. Sec. by August 1.

Granard Union, Finnea Dispensary.—Medical Officer. Salary, £100, with fees, and £14 as Sanitary Officer. Election, August 5.

Great Northern Hospital, Caledonian Road, N.—Junior Resident Medical Officer. Board, but no salary. Applications to the Secretary by August 1.

Manchester.—Resident Assistant Medical Officer to the Workhouse. Salary, £140. Applications to the Clerk of the Guardians, New Bridge Street, by August 2.

Sheffield School of Medicine.—Medical Tutor. Salary, £120. Applications, stating qualifications, to the Hon. Sec.

Sheffield General Infirmary.—House Surgeon and Assistant House Surgeon. Salaries, £120 and £80 respectively, with board, &c. Applications to the Medical Staff before August 16.

Woolwich Union.—Assistant Medical Officer to the Workhouse. Salary, £75, with board, &c. Immediate applications to the Clerk of the Guardians.

APPOINTMENTS.

BATTERSBY, H. J., M.B., M.Ch. Dub. Univ., Medical Officer to the Shillelagh Union Workhouse.

BRAMWELL, J. B., M.D., M.R.C.S.E., Medical Officer of Health for the Newcastle-on-Tyne Port Sanitary District.

CAMPBELL, J., A.B., M.B., T.C.D., Registrar to the Catholic University School of Medicine.

CRALLAN, G. E. J., M.R.C.S.E., Assistant Medical Officer to the Northumberland Lunatic Asylum, Morpeth.

FOX, G. N., M.B., M.Ch. Univ. Dub., Medical Officer to the Crossakiel Dispensary, Oldcastle Union.

GAGE, R. C., M.B., C.M., Medical Officer and Medical Officer of Health for the Cruagh Dispensary District of the Ballycastle Union, co. Antrim.

HARVEY, A., M.R.C.S.E., Junior Resident Medical Officer to the Royal Free Hospital.

HILL, A. B., M.D., L.R.C.P.Ed., Professor of Chemistry and Practical Chemistry at Queen's College, Birmingham.

HODGES, J. F., M.D., F.C.S., Public Analyst for the County Armagh.

HODGES, Mr. R. W., Apothecary to the Queenstown Dispensary, Cork Union.

JACOB, E. H., M.A., M.B., Honorary Physician to the Leeds Public Dispensary.

JACKSON, A., M.R.C.S.E., House Surgeon to the Beckett Hospital and Dispensary, Barnsley.

SMITH, C. C., L.K.Q.C.P.I. & L.M., L.R.C.S.I., an Assistant Medical Officer to the Essex Lunatic Asylum, Brentwood.

WALFORD, R., M.R.C.S.E., Resident Medical Officer to the Guest Hospital, Dudley.

Births.

BURDEN.—On July 20, at 9 College Square North, Belfast, the wife of Henry Burden, M.D., of a son.

HOWARD.—On July 23, at 13 MacGowan Terrace, Ranelagh, the wife of Henry Howard, L.R.C.S.I., of a son.

MACSWINEY.—On July 18, at 1 Hume Street, Dublin, the wife of S. M. MacSwiney, M.D., of a daughter.

NOBLE.—On July 24, at Kendal, Westmoreland, the wife of S. C. Noble, M.R.C.S., of a son.

THOMAS.—On July 21, at Poclinton, Yorks, the wife of G. H. W. Thomas, M.R.C.S., of a daughter.

Deaths.

BARRY.—On July 12, at Kanturk, co. Cork, Gerard Patrick Barry, M.D., aged 79.

KINLOCH.—On July 9, Alexander John Kinloch, M.D. (formerly Low), of Park Place, Deeside.

LOGIE.—On July 14, at Kirkwall, Orkney, William Alexander Logie, L.R.C.P.Ed., aged 27.

SMITH.—On July 20, at Upton, Little Hereford, Herefordshire, John Soden Smith, M.R.C.S.E.

SPRAGUE.—On July 10, at Kimbolton, Charles Sprague, M.R.C.S.E., aged 70.

WARE.—On July 25, at Southampton, J. R. Ware, M.R.C.S., aged 79.

IRISH POOR-LAW INTELLIGENCE.

CORRESPONDENCE.

PAYMENT OF SUBSTITUTES FOR DISPENSARY DOCTORS.

TO THE EDITOR OF THE "IRISH TIMES."

I.

SIR,—Mr. Fisher's reply to my note on this subject escaped my notice. Not to occupy your space unduly with a subject which has special interest only for a class, I beg at once to join issue in the most emphatic manner with the following *pronunciamento* of Mr. Fisher:—"The medical officer, in accepting his position, binds himself to perform the duties, either by himself or his temporary substitute, and is bound to compensate the substitute, whether the guardians contribute or not. That is the law of the case." This enunciation of the law of the case, I assert, is the offspring of Mr. Fisher's intelligence, and is not only unsupported by, but directly at variance with, the wording of the Act and the regulations, and with the custom throughout Ireland. The phrase contained in the regulation:—"The guardians shall determine the remuneration, if any, to be paid to the substitute," was framed to enable the guardians, who, otherwise, would have to pay on all occasions, to recognise private arrangement between the dispensary doctor and the *locum tenens* whenever it pleased the doctor to make such an arrangement. It has, however, been frequently used by boards of guardians as an excuse for refusing any remuneration whatever to the *locum tenens*. As to Mr. Fisher's proposition that the Government should be asked to pay half medical superannuation as they already pay half salaries, I beg to inform him that he was anticipated in the suggestion two years ago by the Irish Medical Association, but the petition to Parliament on the subject could not be received, because it is contrary to Parliamentary rule to petition for a grant of money. On this point the Irish Medical Association will, I am sure, be ready to co-operate with Mr. Fisher.

I am, sir, yours truly,

ARCHIBALD H. JACOB, M.D. Dub., F.R.C.S.I.

23 Ely Place, Dublin.

TO THE EDITOR OF THE "IRISH TIMES."

II.

SIR,—I wish to say a few words with reference to the letter of Dr. Jacob in your issue of this day. The dispensary doctors of the Waterford Union are each paid £120 a year, and in addition two of them receive £25 a year each for sanitary duties, and five of them £20 a year each for these duties. They are also paid for vaccination and for registration. The emoluments range from £150 to £250 a year. Dr. Jacob quotes correctly the article under which they are appointed, but he omits to lay stress upon two important words:—The guardians are to determine the remuneration, "if any," to be paid to the temporary substitute. The medical officer in accepting his position binds himself to perform the duties either by himself or his temporary substitute, and is bound to compensate the substitute whether the guardians contribute or not. That is the law of the case The guardians of the Waterford Union have acted very liberally towards their medical officers with regard to salaries; they have also paid £3 3s. a week to temporary substitutes, and have pensioned one of their officers, though he accepted the position at a time when there were no pensions. They included the cost of temporary substitutes and the pension in the return of medical expense in order that they might be recouped one-half of that charge, but the Local Government Board struck out these payments, and the result is that the ratepayers, for whom Dr. Jacob appears to have neither feeling nor pity, have had to pay the entire of these expenses instead of one-half. Had Dr. Jacob and the members of the medical profession taken up the views of the Waterford Board of Guardians, and urged upon the Local Government Board and the House of Commons the propriety of contributing one-half the cost of temporary substitutes, and one-half the cost of pensions to medical officers, they would have done a real benefit to the profession, and would have encouraged boards of guardians to be generous; but I think where the medical officer is bound not only suggest his *locum tenens* but to pay him, it is neither wise nor gentlemanly to suggest that boards of guardians are anxious to "stick" the doctor. When a medical man applies for the position of medical officer, and such application is his voluntary act, he knows that if he is temporarily incapacitated by illness or other cause he is to recommend a medical practitioner to the committee, which appoints the substitute and reports same to the guardians, who shall determine the amount of remuneration, *if any*, to be paid to the temporary substitute. The obvious meaning of this contract is, that the dispensary medical officer is bound to compensate the temporary substitute, and that any aid given by the guardians is perfunctory If the medical men will induce Government to contribute one-half their expenses, as I think they are bound to do, I believe they will find boards of guardians not unwilling to act liberally towards them; and I think the influence of such an important body as the medical profession would bring about this result.

I am, Sir, yours respectfully,

Waterford, July 11, 1879. JOSEPH FISHER.

SUPERANNUATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Will you kindly allow me to trouble you with a few remarks on the subject of superannuation for poor-law medical officers? and I may preface them by saying that I would not do so, but would leave the subject to some other writer better qualified, were it not evident to me that it is not at present receiving the attention it deserves, and if we ever hope to have it satisfactorily settled the sooner an effort is made the better; and it strikes me the present time is very opportune, as it is more than probable a general election will soon take place, and I suppose the greater number of medical officers are voters. This being so, I think we should work together, and when we are asked for votes give them to the candidates who will promise to support a reasonable superannuation bill, no matter what their politics may be. Now I know that there is a feeling of dissatisfaction among us with the Irish Medical

Digitized by Google

Association, and some think that it should have taken steps in the matter before now, instead of at each annual meeting passing a resolution "that it would be very desirable, and to the advantage of medical men and the public," &c., &c. This may be all very well, but it does not bring us a bit nearer our wishes. I for one gladly acknowledge that the Association has done a great deal for us in many respects, but some of the subjects it has given its attention to and has had satisfactorily arranged are nearly worthless; as an example of what I mean I may mention fees in cases of prosecution against vaccination defaulters. In such cases I have never yet been called upon as a witness, and I am sure there are numbers of my *confrères* who have the same story to tell, so that this is next to useless for us. I do not wish at all to throw blame upon the Association, but if I can stimulate its officers to use more exertion and obtain for us a suitable superannuation bill my object will have been more than gained.

I observe in the last Report of the Association that it is stated "that there is a tendency on the part of boards of guardians to be more generous on the subject of superannuation than formerly. Now I can't really see how this conclusion is arrived at, but I know for a certainty that in a number of unions a strong effort has been lately made to reduce our already miserably small salaries, and would have been successful too had we not the Local Government Board to prevent such an injustice. Such being the case, what, I ask, can we expect from guardians as to superannuation?

Now the way I look upon it is this: we are at present half Government officers and half officers of the union we belong to, as each of them pays half our salaries; and such being the case, I don't see why the Government have not as much right to pension us as the guardians, or why we should be treated so very unfairly compared with other officers—even a head constable of the constabulary retires from his service with a better pension (and no begging for it) than is generally given to poor-law medical officers, although we are members of a learned profession, and many of us have been at the expense of a university education; and to me it is evident that this state of things will continue as long as the present system remains in force.

The reason that was formerly given, and for all I know to the contrary is even now, for withholding pensions from us—namely, "that all our time is not given to our public duties," is, I say, very unfair; for what minute, day or night, dare we refuse to attend on a red ticket when called upon; or is not a workhouse medical officer liable to be called upon at any moment to visit a patient at his hospital?

I hope this subject will not be allowed to drop, and that the Irish Medical Association will use all its endeavours to have it satisfactorily settled.

Truly yours,

Brackaville, July 21, 1879. W. Leatham.

MEDICAL OFFICERS' SALARIES.

TO THE EDITOR OF THE "WATERFORD STANDARD."

Dear Sir,—Now that generally through the country Boards of Guardians are advocating the reduction of salaries, I beg, through the columns of your paper, you will allow me to call the attention of poor-law guardians and the public at large to the case of the poor-law medical officers.

In addressing this letter to you I feel quite certain I am only mentioning facts which are already well known to the majority of your readers; still some may not be aware of all the particulars, and what a really trivial burthen the doctors' salaries are to the ratepaying farmers. I will adduce this union, with which I am connected, as an example, and in doing so believe that it would contrast unfavourably as regards medical expenditure with most other unions.

The entire rateable valuation is £33,580, and the population 13,400. There are three medical officers, paid by the guardians; two connected with the dispensary, and one attached to the workhouse and fever hospital.

The entire amount paid to the medical staff is £395 (including salaries as medical officers of health), and of this sum the Parliamentary grant provides one-half; so that with registration and vaccination (£39) the rates are chargeable with £236 10s.

Now, the landlord pays half the rates, and necessarily half this sum also; so that, in reality, all the ratepayer has to contribute is £118 5s. (¾d. in the £), or at the rate of £39 odd for the services of each doctor—a sum not much more than sufficient to pay and feed his servant.

Unquestionably the times are bad, and very many farmers are in a sad way; but guardians and ratepayers should remember that this depression affects alike all members of the community, and that the doctor, and the priest, and the merchant, and every man dependent on the public for a livelihood, must suffer by it alike.

Now, when the private practice of the doctor is almost *nil*, when a fee is indeed a *rara avis*, surely this is not the time to clip his already slender salary—and all for what? To effect a saving (say 10 per cent.) on ¾d. in the £!

There are not in this union very many ratepayers whose valuation exceeds £100, which, at the rate above mentioned (¾d.) would leave them to pay each 6s. 3d. as his share for the medical care and treatment of the sick poor of the union.

Surely no reasonable man could object to the payment of so small a sum (which is in most instances, of course, much smaller), when he considers how often the physician is the means of alleviating the sufferings of the poor, and is often the instrument in God's hand by which human life is saved or prolonged, and consolation and joy brought into the cabins of the wretched and lowly. Apologising for trespassing so much on your space,

I remain, yours, &c.,

John L. Walshe, L.R.C.S.I., &c.
Medical Officer Kilmacthomas Workhouse and Fever Hospital.

Kilmacthomas, co. Waterford, July, 1879.

OMAGH UNION.

VACCINATION NOTICES.

Mr. Moore, in pursuance of his notice of motion, moved—"That the notice which the registrar is bound to serve upon the party attending to have a birth registered is sufficient under the Compulsory Vaccination Act, and that any further notice is unnecessary before proceeding by summons against the persons responsible for neglecting to have a child vaccinated within six months after its birth." The notice served by the doctor or registrar should be quite sufficient; and even taking it the other way, if the relieving officer is bound to serve the notice, it clearly formed part of his duty, a duty which he should discharge without extra pay. But the first notice should be quite sufficient, or of no avail whatever. If of no avail, why issue them at all? Mr. Moore then read the law bearing on the point—in which there appeared to be no mention made of a second notice. In the face of this he was of opinion that no relieving officer should be asked to serve a second notice, or if that official did serve such a notice he should receive no compensation for so doing. He would propose that there be no compensation given to the relieving officers for such work in future, and that no second notice be served.

Mr. R. S. Clements—I beg leave to second Mr. Moore's motion. I think the guardians should take steps immediately towards getting a penalty imposed when the six months is expired. The doctor is a competent and proper person to serve a notice before then. If he is not, I would be very happy some person should show us that such is the case.

At the instance of Colonel Buchanan,

Mr. Moore said it was the relieving officer that wanted to get £10 for serving notices on the parents and children not vaccinated after the first notice had been served.

The motion was unanimously passed.

WEXFORD UNION.

Dr. Pierse, medical officer Wexford dispensary district, reported that he visited an old man named Moore, whom he found in a most wretched state, lying on a quantity of filthy straw, unfit for a pig stye, in a miserable hut which was totally unfit for human habitation, beside a ditch, and

Digitized by Google

most dangerous to the health of the locality. He recommended that the hut should be destroyed and the man removed to some dwelling-house. The relieving officer said that the Moores were dispossessed a few weeks ago; the man was 78 and the woman 60 years of age. They were living in an old ditch or dyke of rushes in the midst of a swamp. A few loose stones with furze bushes against them, to prevent the wind whistling through, and some old broken boards over them, constituted the hut. The man was lying on an old door with rushes or straw, and a few old rugs, that could scarcely be called bed covering. The old man was blind and bedridden and had no shelter from wind or rain in the hut, which was open at both ends yet he refused to go to hospital. The Chairman said they were now in the hands of the sanitary authority and it should deal with them. He then read the section of the Public Health Act, relative to Uninhabitable Dwellings. Mr. Chandler asked what time was allowed by the Act. The Clerk replied that they should give them seven days' notice. Mr. Chandler said he would give them only as short a time as possible. The guardians then determined to give the Moores only till Monday to remove from their hut, the Chairman remarking that where human life was in danger it was expedient that the letter of the law should not be adhered to. The notice was then personally served on Mrs. Moore, who came before the Board and requested to be informed what the paper she held in her hand was. The Chairman explained the nature of it and said it was what the law directed in such cases.

Mrs. Moore—The law does not direct me to be turned out of my place; it was done to give it to another.

The Chairman—The law is protecting human life.

Mrs. Moore—It is a queer law; why did it not protect us when we were in our little place?

The Chairman—If that old man dies the law will hold you responsible for it.

Mrs Moore here became very excited and affected, in which she threatened if her man died to take an action against sundry people, and to bring her case before the Four Courts, Dublin.

WATERFORD GUARDIANS.

PAYMENT OF SUBSTITUTES.

Mr. Fisher suggested that as the Local Government Board refused to pay one-half the salary of a dispensary medical officer's substitute during the absence on leave of the former, the board should inform the medical officers that in future they should pay their substitutes.

The Chairman—You can scarcely do that in cases of their being stricken down by illness, say by fever.

Mr. Kent—Has not the Government a right to pay half?

The Chairman—But, they won't.

Mr. Newell—I think we should treat every case on its own merits. Does not a doctor pay his own substitute when he goes away for pleasure?

The Clerk—Yes.

Mr. Norwood—I would suggest that we pay half the substitute's salary, which is to be fixed at the rate of pay of the medical officer. (Hear, hear.)

Mr. Bloomfield—That is a very good suggestion.

Mr. Norwood's suggestion was adopted, and the matter dropped.

CARLOW UNION.

LEAVE OF ABSENCE.

Letter read from Dr. Rawson, applying for leave of absence on account of ill health, and requesting that Dr. McDowell should be allowed the regular scale of remuneration.

Mr. H. Cullen—Who will pay the *locum tenens*.

Chairman—We will.

Mr. H. Cullen—But he is getting so much out of the rates already.

Mr. W. Edge expressed himself in favour of granting the application, but did not know if Dr. Rawson was right in nominating the Doctor to do duty in his place, as he thought that was for the Board.

Chairman—It is usual for them to nominate a Doctor to do duty in their place, but the Board may or may not act upon it.

Proposed that Dr. Rawson's application be acceded to. Carried unanimously.

SLIGO DISPENSARY.

A meeting of the Committee was held to consider a requisition for supplies of medicine, &c.

COMPLAINT AGAINST THE DOCTOR.

The Chairman wished to mention an observation that had been made to him with reference to Dr. Palmer neglecting to attend a patient though served with a ticket, so that the poor man died without medical attendance. Perhaps he had been misinformed, or else that the doctor could show some good reason why he was not there.

Mr. Walsh—The committee would not be doing their duty to the poor people if they did not insist upon an explanation.

Mr. Dunnigan—What time did he receive the ticket?

Dr. Nixon—Or did he receive it at all? I happen to know something about the matter, too, for one of the parties came to my house early in the morning and he had no ticket then.

Mr. Cullen—The man's brother came to me to make a complaint upon the subject; and they said that the ticket had been sent to Dr. Palmer about ten o'clock on the day in question. The doctor, however, did not come, and later on the man's wife went to his own house, and told him that her husband was dying. She spoke to him, it appears, at his own door, and the only satisfaction he gave her was to puff a cigar in her face and tell her go away about her business. The consequence was that the man died the same night, about ten o'clock, without having any medical attendance whatever.

The Chairman—But we must be careful not to take statements for anything but what they are worth.

Mr. Walsh—I propose that an investigation be held into the whole matter. It is a most serious business altogether that a medical officer gets a ticket to attend a patient, at ten o'clock in the morning, and that the poor man is allowed to die unattended to at ten o'clock in the evening.

Mr. Cullen—The parties also told me that Dr. Nixon came to the place next morning, after the man was long dead, and that they told him of the circumstances, and asked him where was the use in the doctor coming now.

The Chairman—Is that so, doctor?

Dr. Nixon—I suppose the ticket must have been sent by Dr. Palmer, as I sometimes do visits for him when he requires me.

Mr. Lyons—Is there any charge against him. We cannot demand an explanation, unless there be a distinct charge made against him.

Mr. Walsh—A certain party came to Mr. Cullen and made a distinct and definite complaint, the substance of which we have now before us, and I think it is our duty to inquire into it.

The Chairman—Is it the feeling of the meeting, then, that we demand an explanation?

The majority of those present expressed themselves in the affirmative.

The resolution was then passed unanimously.

WATERFORD UNION.

MEDICAL OFFICERS' SUBSTITUTES.

The Local Government Board acknowledged the receipt

Digitized by Google

of the resolution of the guardians on the 9th June, containing a resolution directing that the medical officers of the union be informed that the guardians will not in any case pay their temporary substitutes, in their absence, more than one-half the regular salary fixed for the office. The Board pointed out that the case was met by article 22 of the dispensary regulations, and it was for the guardians to determine under the circumstances in each case the amount of remuneration, if any, to be paid, subject to the approval of the Local Government Board. The guardians, however, have no authority legally to fetter the discretion of the guardians at any future meeting as to the rate of remuneration which a majority of guardians may think proper to allow in each case on its own merits.

Mr. Fisher—Will a private patient pay his own doctor and the doctor's substitute at the same time, if the doctor chooses to go away? It was right for the Board to say that they will not pay more than one-half of the salaries of the substitutes. If they did so they would prevent the ratepayers from being mulcted.

The Clerk—That resolution does not bind any future Board.

THE ISSUE OF DISPENSARY TICKETS FOR PROFIT.

We find the following outspoken letter in the *Leinster Express*:—

Sir,—While the recent transactions of the Blesinton and Ballymore Dispensary Committee are fresh in the memories of your readers, I should like to make a suggestion relative to the propriety of certain persons to issue tickets for medical relief. The 11th section of the Medical Charities (Ireland) Act, 14th and 15th Vic., cap. 68, enacts "that no guardian or member of a committee of management shall furnish or supply *for his own profit*, any article for the use of the dispensary, during the time for which he shall retain such office, under a penalty of £50." In a more extended meaning, this clause may admit of a construction other than that intended by the Legislature. The sources of profit may be direct and indirect; to the former only does the Act apply. But profit derived from an indirect source is none the less profit on that account. In very many dispensary committees in Ireland, strange to say, a licensed publican figures: and where these gentry are found, they are as a rule, ignorant, sententious, blatant, and quarrelsome, ever ready, in virtue of their little brief authority, to assert their views in opposition to those of their betters, who, unluckily, are doomed to sit in the same board-room with them. The policy of Jack Cade is that adopted in the present day, by those who would secure the fleeting popularity of the mob, viz., the complete subversion of existing institutions, and the degrading and dragging through the dust of those who are wiser and better than themselves. But to return to what bears more directly on the subject. During the nine months I have acted here as medical officer of this dispensary district, 424 tickets were issued by the dispensary committee composed of twenty-one members. Of this number ninety-four, or nearly one-fourth, were issued by a publican, upon a great many of which I found it necessary to comment, for being issued to persons who were not entitled to them, for frivolous cases, and in some instances, I believe, with no other intention than that of giving me trouble unnecessarily. Of the remaining 330 tickets issued by twenty members of the committee, I only found it necessary to comment upon three.

Now, sir, what is the cause of all this? Why are these men, in particular, the champions of the helpless and suffering poor? Is it, like another class of the community, on account of "the deep interest (?)" they take in the welfare of the poor? My solution of the problem is this—they acquire popularity at my expense, and if at mine, at the expense of the ratepayers also. Popularity and the amount of drink "consumed on the premises" are in a direct ratio. Truly a gratifying reflection to a learned profession, that they are agents for the sale of publicans' whisky. Oh, luckless followers of Æsculapius, beat thy scalpels into pint-pots and thy forceps into corkscrews, for is not thy lot cast among pot-boys and tapsters! I found this grievance to exist also in a dispensary which I held previous to this. The remedy for this state of things is practical and obvious. Let no publican be permitted to issue tickets for medical relief; the privilege being abused, let the trade in general pay the penalty of the abuse. I consider steps should be taken to bring this matter before parliament, for it is glaring and unsentimental injustice, and an insult to gentleman and the medical profession.

One word in conclusion. Perhaps the tone of courtesy expressed in the wording of the ticket for medical relief may be interesting to those who are not familiar with this imposing document, which, to my mind, savours more of a subpœna than what it ought to be—a request from (in very many cases) an inferior to his superior:—

"Sir,—You are hereby required to visit and afford medical advice and medicine to————residing at————, who is by occupation————

"Signed ————"

Publican, &c., as the case may be.

This document wants the "herein fail not at your peril" to make it perfect.

Apologising for encroaching so far on your valuable column,—I am, dear sir, yours faithfully,

Leslie Maturin.

It is right that we should express our opinion as to Dr. Maturin's statements and opinions on this subject, and we, unhesitatingly, corroborate the assertions which he has made, and endorse his objection to the form of the ticket. We are able to state as the result of long experience of the system, that the authority to grant tickets is frequently sought for and made use of by shop and shebeen keepers in Ireland as a stimulus to their business, that they repay the custom of farmers and cottagers by giving them orders upon the doctor, and that it is well understood by the poor that the grant of a ticket should be requited by the spending of a little money in the committeeman's shop, either for liquor or other goods. As to the form of the ticket we certainly think that in retaining the offensive form of expression, the Local Government Board inflicts a public insult upon their medical officers. We know of many cases in which the holder of a ticket has behaved himself insolently to the medical officer, because the ticket told him that he was, *pro tem*, the doctor's master, and we know instances in which the grantor of a ticket has been punctilious in enclosing the ticket in a sealed envelope, lest the words in which it was couched might encourage the grantor to demand too much. We don't for a moment desire to make the ticket less peremptory or to give undue latitude to the doctor in the discharge of his duty, but we know that the regulations are sufficiently stringent, and need no public assertion of the paupers' authority to make them more forcible.

STRADBALLY DISPENSARY.

PAYMENT OF SUBSTITUTES.

Mr. M'Laughlin brought under the notice of the Board the fee of two guineas that had been unanimously voted to Dr. Symes for his services while acting as *locum tenens* for Dr. Percival.

After a short discussion the guardians agreed to pay the amount.

SHILLELAGH UNION.

At a recent meeting of the guardians of the above union, Dr. Battersby, Hacketstown, was appointed as medical officer to the hospital and infirmary, in room of Dr. Bookey, resigned.

Original Communications.

ON UTERINE INFLAMMATION AFTER THE MENOPAUSE.

By EDWARD JOHN TILT, M.D.,

Past President of the Obstetrical Society of London.

III.

It used to be taught, that uterine inflammation was never met with in young unmarried women, and after the menopause. Unfortunately, acute and chronic uterine inflammation is occasionally met with, before 20 and after 50, and it is most important to recognise such cases, for they imply very strong predisposition to diseases of the sexual organs, combined with the persistence of causes likely to bring on inflammation, and to render more difficult its cure. I have known acute inflammation of the cervix to come on, for the first time, at 50, some years after the change of life had been concluded, but the post-cessation period of the change of life is generally the reliduary legatee of the pathological tendencies of previous periods of more active uterine energy, as in the following case :—

Mrs. H., was 50 in 1875, a tall, strongly-made woman, the mother of 13 children, and the birth of the last was followed by twelve years of uterine disease, clearly indicated by the usual symptoms, and by an almost continuous vaginal discharge of blood or pus. She consulted several medical men, but was told that nothing should be done, as the change of life would set all right. At 44 cessation occurred, but she went on suffering just as before for some years, and at last this long continuance of uncontrolled uterine disease, family cares, and the lifelong dread of scenes with a passionate husband, had thoroughly shattered her nervous system, when, at the suggestion of Dr. Gregory, of Strood, she consulted me. The womb measured five inches, the cervix was hard and much enlarged, the os uteri was three-quarters of an inch wide, and internally ulcerated. The sound passed easily through the cervical canal, but there was occasionally spasmodic stricture of the os internum, for after some days of dull, central, pelvic pain, she suddenly had stabbing pains, and expelled at one gush about an ounce of pus, which came away by the vagina. In this case the general symptoms gradually mended under the influence, first of large doses of bromide of potassium, and then of quinine, opium suppositories being given by the rectum, whenever the womb was surgically treated. Nitrate of silver, and the acid nitrate of mercury, did little good in this case, but marked improvement followed the application of potasse fusa c. calce, to the whole of the cervical canal. The cervix gradually decreased in size, it became softer, and the spasmodic expulsion of matter ceased to occur, although no surgical application was made to internal surface of the body of the womb. This patient was wonderfully improved in every way when she ventured home after three months of treatment.

It is not surprising that chronic uterine inflammation should be aggravated and brought to light by the menopause, for ovarian involution is only half-concluded at cessation. A remnant of ovarian power still shows itself during the following year by the more or less *periodical* occurrence of pelvic congestion, made apparent by a sense of abdominal heat and weight and fulness, or by leucorrhœa, congested liver, diarrhœa, or piles.

The womb may be diseased in its entirety, as in the case just related; but as through life, so after cessation, the cervix and the body of the womb may be separately diseased. Nothing exceptional is noted in cervicitis occurring during the two or three years that follow the menopause, except the utility of taking five or six ounces of blood from the arm, when the complaint is made worse by uterine congestion, unrelieved by the menstrual flow. I have applied leeches to the cervix in such cases, but their repeated application prolongs the habit of pelvic congestion, which is more likely to be checked by bleeding. When the cervix is inflamed many years after cessation, I have

Digitized by Google

found it smaller and harder than usual, and covered inside and out by a less vascular mucous membrane than previously. There has been more or less desquamation of the mucous membrane lining the cervix, and cotton wool comes back stained with blood or with pus, but there is little or no vaginal discharge, unless the vagina was also inflamed. In the course of long practice I have occasionally been surprised to find a serious amount of cervical inflammation in women at the prime of life, without the mischief having been made apparent by the customary vaginal discharge, and I explain to myself the more frequent occurrence of this peculiarity in old age, by this diminished vascularity of the mucous membrane of the cervix. In the absence of vaginal discharge, practitioners are justified in hoping that somewhat obscure symptoms of pelvic disturbance may yield to rest and to appropriate remedies; and they generally succeed in doing thereby, all that is required, without putting an old lady to the annoyance of an accurate examination. As a consulting practitioner I have had to investigate similar cases, that had not yielded to good treatment, and finding symptoms pointing to the womb as to their cause, I have examined the patient, and I have found the morbid lesions just described to be the unsuspected cause of a slight but habitual loss of blood, a fact proved by the cessation of the blood loss, on the application of nitric acid to the ulcerated surface. I have more frequently noted, that vesical disturbance, and the very frequent desire to micturate, was caused or aggravated by cervical inflammation. By directing my attention principally to the treatment of this disease, I have cured several cases of sciatica. I have repeatedly been consulted by women who could not walk, who had suffered severely from a variety of cerebral symptoms, and who had only been partially benefited by good medical treatment. Finding in these cases, that there was habitual pelvic pain and heat, and occasional vesical distress, I have been led to examine, and have found cervicitis to explain why good medical treatment alone could not cure the nervous derangement. A saturated aqueous solution of medical carbolic acid is the best topic in such cases, applied at the interval of a week by means of a little pellet of cotton-wool.

All that can be done in such cases by caustic applications, is to check blood flow or the secretion of pus. It is injudicious to seek to restore the uterine mucous membrane to a thoroughly healthy condition, for its permanent redness may not be attended by any bad symptoms. I have known such a condition to last for years without becoming worse, and I have not improved it by persistence with caustic treatment. The agency of the stronger caustics must not be allowed to impair the permeability of the cervical canal, for the body of the womb may still remain too large, its lining membrane may secrete morbid fluids requiring an exit, and the denial of such an exit has been known to lead to serious accidents, of which I will treat more fully in a concluding paper. I need scarcely add that the recovery of the cases treated of in this communication is expedited by a mid-day rest on the sofa, cooling injections, warm hip-baths, attention to the bowels, and by the administration of such remedies as the constitution may require.

(To be continued.)

THE annual death-rate from the seven principal zymotic diseases in the large towns last week averaged 2·6 per 1,000. Scarlet fever showed the largest proportional fatality in Sheffield; measles in Salford; and fever in Salford, Hull, and Leeds. Small-pox caused 6 more deaths in London, one in Dublin, but not one in any of the other large towns. The fatal cases of diarrhœa were but 61 last week, against 904, 275, and 991 in the corresponding weeks of the three years 1876-7-8.

A CASE OF DOUBLE LACHRYMAL FISTULA IN A PATIENT THE SUBJECT OF TERTIARY SYPHILIS AND OZÆNA.

By Mr. W. SPENCER WATSON.

MARY C., æt. 24 years, a domestic servant, was admitted into the Central London Ophthalmic Hospital on January 1st, 1876. There was a clear history of syphilis, and her hair was very thin, and constantly becoming thinner. The lachrymal sacs were swollen and inflamed, and a fistulous opening on each discharged a thin serum. The nostrils gave out a characteristic ozænic stench. Her general health was very bad. For the first twelve days she was directed to use the nasal douche of permanganate of potash in warm water night and morning, and to apply cold poultices with lead lotion over the inflamed regions. At the same time a mixture containing 2-gr. doses of sulphate of iron was given three times a day. Her general health having somewhat improved, on January 12th the lower canaliculus on each side was laid open, and a few days later the full-sized conical probe was passed through the sac into the nose on each side. She was now given syrup of the iodide of iron in 1-drachm doses, and continued to use the douche. Very great improvement, as regards the overflow of tears, commenced at once; but as late as January 30th the fistulous tracks on the cheek still remained open.

On February 19th, the general health remaining very cachectic, and the sinuses looking unhealthy, she was ordered two drachms of the syr. ferri iodid. three times a day, and the dilute nitrate of mercury ointment was applied to the inside of the nostrils as high up as it could be passed. At this period an ulcer of the septum was discovered, and this subsequently left a perforation. From this date the conical probes were passed about every third day, and the other remedies continued till the sinuses closed, about the beginning of March, and the overflow of tears had then quite ceased.

On March 28th the improved condition of the patient remained, and the ulcer in the septum was found to be completely cicatrised, though with a circular perforation.

Remarks.—The aspect of this case was very unfavourable at first and gave indications that some extensive disease of the bones in the upper part of the nostrils was the origin of all the mischief. There is every probability that the ulceration, which was visible in the septum, extended higher up within the nostrils. It was, therefore, of the utmost importance to ensure a more healthy action within, before endeavouring to overcome the obstruction by mechanical means. Hence the douche was employed, and steel tonics administered, with the effect of diminishing very much the ozæna, and removing the crusts that had been hitherto accumulating in great abundance.

Any attempt at probing the sac in these cases is always attended with some risk of setting up increased irritation, and perhaps causing necrosis of the bones in the neighbourhood. The general health, therefore, should always be most carefully attended to, and in cases of syphilis it will often be necessary to give iodide of potassium and decoction of sarsaparilla until the swelling and sanious discharges have disappeared, and the general health has improved. The permanganate of potash douche is also most valuable as an adjuvant, and seems to improve both the local condition and the general health *pari passu* in a very short space of time. Iodide of iron seemed to be indicated in this case from the very cachectic aspect of the patient, and there can be little doubt that it very materially contributed to the success of the treatment.

Clinical Records.

CASE OF HODGKIN'S DISEASE.

By M. CHARTERIS, M.D.,
Professor of Medicine, Anderson's College, and Lecturer on Clinical Medicine, Glasgow Royal Infirmary.

THE following case, for notes of which I am greatly indebted to my former resident assistant, Dr. N. A. Talpaid, brings out in remarkable prominence the leading features of this peculiar disease.

Previous History.—The patient, F. R., æt. 16, a tinsmith, was admitted into the Royal Infirmary on 7th March, 1879, having been recommended to my care by one of the physicians of Anderson's College Dispensary. His mother stated that about four years ago she first observed a swelling about the size of a marble below the right lobe of the ear. Two years afterwards a similar swelling appeared below the right lobe of the ear. About six months ago she noticed the thyroid gland swollen, and subsequent to this the glands in the armpit and left inguinal region were enlarged. Since these latter swellings began the patient has been feeling weak, unable to work, and gradually becoming thinner. The other members of her family, four in all, were healthy.

Condition on Admission.—The patient was observed to be a spare, thin, emaciated lad. His face was pale, and on undressing, the veins of the chest and abdomen were markedly prominent. The glands below the lobes of both ears were swollen to the size of an egg. The other glands of the neck, and particularly those along the border of the sterno-mastoid, were also enlarged. The thyroid was also enlarged to a considerable extent, and so also were the axillary glands of both sides. It was noteworthy, however, that while the inguinal glands of the left side were increased in size, those of the right remained normal. The glandular swellings were moveable, and were neither red, tender nor painful. The percussion note of the left side of the chest was duller than the right, and crepitation was observed in the left infra-clavicular region. The cardiac sounds were normal.

The patient complained of pain on pressure both in the hepatic and splenic regions, but there was no abnormal dulness either of the liver or spleen. Blood drawn from the finger and placed under the microscope showed no increase of the white corpuscles. The latter fact, and the non-enlargement of the spleen, were, during life, the main elements for diagnosing the case to be not one of leucocythæmia, but of lymphadenoma—the Hodgkin's disease of England, the œdema of Trousseau, the pseudo-leucæmia of some authors. It may also be mentioned that the urine was acid, of sp. gr. 1021, and was free then, and during all the illness, from albumen.

For the first two days the patient could walk across the room, although his gait was tottering and uncertain. After that he preferred to keep to his bed, and preserved a listless attitude, rarely choosing to answer questions, and preferring simply to be still, and caring little for either food or drink. His temperature, which was carefully taken, indicated 99° or 100° Fahr. in the morning, while in the evening it rose to 103° or 104°. Copious perspirations followed even the slightest sleep. Gradually he became weaker. The difficulty of breathing increased, and he was unable to retain any food. For the last two days of his life he was delirious, and his lips and mouth were covered with sordes.

At the morning visit of the 22nd of March his face was flushed, the difficulty of breathing was great, and he appeared as if he was choking. To give temporary relief to his distressing condition, Dr. Cameron performed tracheotomy. Twelve hours afterwards the patient died quietly.

Mr. Nelis's report of the post-mortem examination is as follows :—

Body spare and emaciated. Superficial glands very much enlarged in cervical, axillary, and inguinal regions. On opening the chest the mediastinal glands are found to be very much enlarged.

Lungs.—The *right* lung was apparently normal, except at its base, where it has some swollen nodules of white tissue resembling lymphatic glands. In the apex of the *left* lung there are a number of patches of yellow softening tubercle, and there is also a cavity about the size of a walnut which contains a quantity of semi-fluid, whitish material. The rest of the lung tissue is congested.

Spleen.—Normal in size, rather pale in colour. On section it presents a number of small, angular, whitish-yellow-looking bodies. There is a recent effusion of lymph around the hilus, and along the upper surface; and mixed up with this there is a small amount of blood.

Liver.—On section, presents a slightly yellowish, greasy, solid appearance, but is not otherwise abnormal.

Kidneys normal. Supra-renal bodies normal. Mesenteric glands everywhere enlarged.

MAGHERAFELT UNION HOSPITAL.

Comminuted Compound Fracture of Leg—Hæmorrhage—Traumatic Delirium—"Spreading Gangrene"—Amputation immediately below Knee-Joint on tenth day after injury—Recovery.

Under the charge of DR. VESEY.

Reported by Mr. F. R. CASSIDY.

AUGUST 23rd, 1878.—George Patterson, æt. 21, by occupation a navvy, an anæmic and delicate looking man, was this day admitted into the infirmary in a state of complete collapse, the result of shock and loss of blood, consequent on a comminuted compound fracture of both bones of the left leg. The fracture was caused by two railway waggons loaded with earth passing over the lower part of that limb just above the ankle.

On examination, splintered fragments of the tibia and fibula were found protuding from very extensive lacerated wounds situated on the anterior and lateral parts of the leg; and higher up a deep punctured wound on the anterior aspect of the limb, and situated immediately over the junction of the upper and middle thirds of the tibia. A portion of his stocking was deeply wedged between the bones. In about half-an-hour after admission this had to be removed, owing to severe hæmorrhage, which was arrested by elevating the limb, the application of tinct. of iron and matico; a bandage, and a tourniquet were applied. The collapsed state of the patient precluded any operative interferences other than the checking of the hæmorrhage and placing the limb in a suitable splint, and as this state remained unaltered on the following day, accompanied by retention of urine, and the use of the catheter, it was resolved in consultation to wait and see what measures would ultimately be necessary. Delay further lengthened by violent diffuse inflammation, which set in early on the third day in the injured limb. This extended rapidly up to the trunk, and was accompanied by high fever, and violent traumatic delirium, which at times required several persons to keep him in bed, the limb at this time presenting a most formidable appearance, being enormously enlarged and disfigured by bullæ which broke out all over the surface. The diffuse inflammation, however, yielded in a remarkable manner to the exhibition of iron, the perchloride being painted over the whole surface of the limb up to the trunk, except over the surface of the bullæ. Internally the perchloride of iron was freely given. The limb was also dusted over with flour.

On the fourth day gangrene showed itself in the foot (the foot and portion of the leg up to seat of fracture had remained of low temperature from the first; this portion was enveloped in wadding and hot jars were applied). The gangrene gradually advanced up into the leg, especially in the posterior parts. Antiseptic dressings were applied, and finally powdered charcoal was freely used. The punctured wound, which was terribly inflamed, being treated with poultice; on the ninth day the man rallied slightly.

At another consultation held on the afternoon of the tenth day it was resolved to amputate the leg just below the knee as a last resource. The operation was performed as agreed upon, without any anæsthetic. The patient, who was in a very low state, was kept alive by frequent administration of stimulants and nutriment. The method adopted was the ordinary circular, Esmarch's bandage having been first applied. The great œdema of the thigh prevented the action of the tourniquet. The femoral artery could not be felt; the first incision giving vent to a large discharge of bloody serum and pus, the flow of which and the distended state of the limb rendered the dissection of the flap a work of considerable difficulty; besides this, except some trouble in securing the main artery, no serious impediment was met with, very little blood being lost, and the whole operation was rapidly

Digitized by Google

performed. A suspicion of hardness, hardly perceptible owing to the extreme distension of the limb, gave rise to a dread of infiltration into the thigh, to prevent which a moderately tight bandage was applied from the body down, causing a steady flow of fluid from the face of the stump. The edges of the wound were approximated with strips of adhesive plaster, and carbolic acid and oil applied. The patient was then put to bed in a cold and almost pulseless state, but under the application of hot-water bottles to the extremities and trunk, stimulants and nourishment being simultaneously administered, he slowly revived. This state was succeeded in about two hours by considerable fever, a great increase of temperature, and a pulse varying from 130 to 140. On the day following the operation this condition was improved, the patient being quiet and drowsy and sleeping for several hours towards evening. From this time his progress has been steady though slow, recovery being retarded by some unfavourable symptoms. Notably a large pyæmic abscess, which formed just over the sacrum, causing great constitutional disturbance, and preventing his lying in bed in the natural way as he could not remain on his back. This abscess, however, opened on the fifteenth day after operation, affording him great relief, and an immediate amelioration of his condition.

The after treatment was simple—full diet, beef, eggs, milk, two glasses of whiskey, and three of wine (for first week, then gradually diminished) every day, with tonics, especially comp. tinct. of bark, chlorate of potash, and carbonate of ammonia, a combination which agreed with him admirably, and sedatives, and a careful regulation of his bowels. The ligatures came away on the eleventh day, permitting the application of stimulating dressings, under the influence of which the wound rapidly filled up, and the patient is now (Oct. 1st) fit to get up and move about, a happy termination to this remarkable case, which was hardly anticipated when he was first admitted, even taking the most sanguine view of his case, and which seemed impossible as the various unfavourable symptoms manifested themselves, symptoms not alone depending on the nature of his injuries, but grave constitutional ones, such as swelling of the hands and face, which manifested itself about ten days after the operation, and had to be treated with the sweet spirits of nitre and iron. Finally, in considering what favoured his recovery, we must give some credit to the good effects of country air on surgical cases, a great deal to his having been previously of temperate habits, and the consequent effect stimulants had on him, and not less to the indomitable courage of the man himself, who never gave up hope even at the gravest crisis of his terrible illness.

Translations.

CONTRIBUTION TO THE STUDY OF THE OSSEOUS TUMOURS ON THE EXTERNAL AUDITORY MEATUS.

By Dr. DELSTANCHE, fils, Brussels.

Translated, by permission of the Author, from the "Mémoires Courronnés et Autres Mémoires," de l'Académie Royale de Médicine de Belgique,

By JAS. PATTERSON CASSELLS, M.D., M.R.C.S., Lond.,

Fellow of the Faculty of Physicians and Surgeons; Surgeon to the Glasgow Dispensary for the Diseases of the Ear; Aural Surgeon to the Glagow Royal Infirmary; and Lecturer on Aural Surgery in the Royal Infirmary School of Medicine, Glasgow; Membre-Correspondant de la Société Royale des Sciences Médicales et Naturelles de Bruxelles.

(*Continued from page 92.*)

Since Bonnafort, Miot, and Field have shown by their successes, the shallowness of the fears which were inspired by proposed operations in the osseous tumours of the external ear, practitioners, encouraged by their results, are no longer content to make a narrow passage through the tumour or by its side; they desire to do more, in order to augment the diameter of the perforation, as much as possible, not only by the help of graduated drills and cauterisations of nitrate of silver and other very powerful caustics, but the gouge, cutting forceps, and the file have been used, according as circumstances indicated the use of one or other of these auxiliaries. It would be, besides, impossible to trace out an immutable line of conduct in the treatment of the tumours in question, because what succeeds in one case does not succeed in another, and it is often necessary to employ a variety of means before obtaining the desired results, as the following observation of Dr. L. B. proves (*Archives für Ohrenheilkunde*).

This *confrère* was 43 years old when, in 1868, he discovered by chance a hard substance in his left ear, which was insensible to the touch of instruments. Till then he had never felt anything in his ears, and had always enjoyed good hearing. But after having tried to remove the obstacle himself by the help of forceps, not without occasioning violent pain, a sero-purulent discharge came from the ear, accompanied by a deafness, which got so rapidly worse that at the end of six days the watch could no longer be heard in contact with the auricle. He then decided to consult two of his *confrères*, who found the lumen of the left meatus obstructed by a hard and white tumour rising from the posterior wall of the canal, besides two analagous growths, smaller, and placed side by side in the right ear.

He was recommended to use astringent instillations to combat the traumatic inflammation of the left ear, and to wait the effects of that medication. The hearing was soon restored, and remained good till April, 1873. He commenced at that time to experience frequent tinnitus, and, wishing to ascertain if it arose from a mechanical cause, he had the misfortune to introduce a probe into the right ear, which came against the membrana tympani, and occasioned a strong irritation of that membrane.

From that time the tinnitus increased and became permanent; whilst, on the other hand, the hearing was almost gone. There was no discharge. After alternations in this condition, he awoke the 14th June, 1873, completely deaf in both ears.

The hearing was soon restored in the left ear, but as the deafness persisted in the right, a consultation was held, at which the patient's *confrères* proposed to establish a sufficient passage for the sonorous waves in the right meatus, by means of an operation. Dr. Knorre who operated, succeeded in making a way through the thickness of the exostosis by means of a trephine, having recourse to toothed forceps, in order to enlarge it. The interior of the excrescence was constituted of thick and resisting spongy osseous tissue. These manœuvres occasioned a discharge and an abundant proliferation of cellular tissue, which soon covered the tumour. With a view to subdue these granulations, muriatic acid was tried, for which sulphuric acid was substituted at the end of three weeks. These very painful appliances produced no effects after eight weeks' usage. Having due regard to these accidents, an iron heated to whiteness was passed rapidly through the opening in the exostosis, and which was repeated several times, without causing much more pain than the caustic substances.

After some days of rest, the inflammation of the soft parts gradually disappeared, and the pain, suppuration, and tinnitus rapidly mended; after a fortnight the patient again heard the watch at 4 c.m. Meanwhile, the improvement in hearing was limited to that distance, and as to the tinnitus, it had not disappeared, but varied in intensity from day to day.

The opening, by which the hearing was re-established, was so narrow that the patient could not pass the smallest probe into it. By way of enlarging it he, at first, tried the laminaria, but not having obtained the desired result, he undertook to accomplish his object by using the file; and although, for more certainty, the patient did this upon himself, he was obliged at last to give it up, as the discharge had reappeared and with it the granulations. A month later, he again renewed these attempts until an inflammatory reaction, more intense than the former, induced him to give up the experiment. His persevering efforts however succeeded in enlarging the diameter of the opening of the meatus, and since the month of April,

Digitized by Google

1874, he not only enjoyed excellent hearing, but the tinnitus completely disappeared.

On the left side, which had not been operated upon, the hearing has been maintained.

Although our private and hospital practice, the latter in the hospital Saint Jean, have furnished us with twenty-five perfectly characteristic cases of exostosis of the external auditory meatus, we have only met with two subjects, in whom the new osseous formation was enough developed for an operation.

One of them, J. C., young man of 21 years of age, had had in his childhood frequent discharges from the ear, whose appearance had been each time preceded with violent pain. The bilateral deafness, with which he had been attacked, dated from nine years previously. By examination of the ears, we discovered on the left side a smooth and slightly convex exostosis, filling up the lumen of the meatus at a depth of about 1½ c.m. On the right side there was a tumour, in every way like the other, but situated still deeper in the meatus. The deafness was so marked that, in order to be understood, one was obliged to roar into the patient's ear; however, the functional sensitiveness of the auditory nerves did not seem to have been attacked since it permitted him to hear clearly the ticking of the watch at whatever part of the skull the latter was applied. There was every reason to hope for good results from an operation for re-establishing the perviousness of the meatuses; but before submitting to it the patient wished to think over it and, to our great regret, he did not again appear at the policlinique.

Fortunately it was not thus with our second patient, and the observation which concerns him, is interesting in relation to the proceedings and the success which attended them.

P. D., carver in bronze, at Brussels, æt. 25, of a good constitution and exempt from all syphilitic or rheumatismal antecedents, presented himself the 23rd February, 1875, at the otological poli-clinique of the hospital St. John. Apart from otorrhœa in the left, in infancy, and which dried up spontaneously after some weeks, he does not remember having had anything the matter with his ears till he was eighteen.

In March, 1869, while he was washing his head, a little cold water having gone in at the left ear, immediately caused the sensation of a violent blow and pain so acute that he was obliged to throw himself upon his bed, where he remained stretched out for more than half an hour, feeling himself unable to make the least movement. At the same time there were tinnitus and vertigo, but no tendency to vomit. That day the patient could attend to his duties as usual, only experiencing in the ear a supportable pain, which lasted till the appearance, forty-eight hours later, of a slight oozing (myringite ?).

That accident left no trace, and it was only after an interval of two years that the patient again commenced to feel pain and tinnitus in the same ear, accompanied with slight dulness of hearing.

Added to these symptoms, sometimes so intense as to deprive the patient of sleep, the presence of a foreign body in the interior of the external auditory meatus was felt, and the patient, prompted by the desire to remove this obstacle by means of an ear-picker, knew that the point of the instrument struck against a hard body situated pretty far down in the meatus.

These explorations, renewed from time to time, enabled him to ascertain that the obstacle gradually increased in size, and that its sensitiveness to the touch of the instrument, at first very great, became dulled. Finally, the point of the little finger, introduced into the ear, could reach it easily.

The hearing on this side became weaker from day to day, but it only became really worse after the appearance of a slight sero-purulent running, the consequence of an attempt at extraction made by the patient with less care than the preceding efforts.

On the morning of the 16th February the patient awoke completely deaf in the left ear, and suffering on that side from an intolerable tinnitus. When he presented himself at the hospital St. Jean, the following was the result of our first investigations—

Right ear perfectly normal in all respects.

About a centimètre from the orifice of the meatus of the left ear, was to be seen a white mass, whose surface was very convex and smooth, and which quite obstructed the lumen of that canal. It was also very hard and could be struck with force by the handle of a probe, without occasioning pain. It was in appearance like to a little polished ivory ball, which had been dropped accidently into that place, the half of it only being visible. The watch was not heard in contact with the ear, but it was very well heard on being applied to the mastoid process, or to the corresponding temporal regions, The vibrations of the diapason placed on the vertex were perceived in the left ear.

The diagnosis was not doubtful and as to the prognosis, it was favourable for establishing, in a certain measure, the perviousness of the auditory meatus.

The first trials that were made to effect this object did not lead to anything, on account of the circumference of the exostosis, coming so closely in contact with the walls of the canal; therefore, several sittings were necessary, in order to introduce the end of a thin silver probe between the walls of the meatus and the tumour, and, being obliged to force a passage, the suffering was great. The instrument was withdrawn after a few minutes and the patient could hear the watch on the side affected, at a distance of several centimètres. We resolved to profit immediately by this discovery, by introducing a gum-tent into the opening just made. However, the latter could not be kept in its place longer than an hour, at the very most, and the next day the ear became the seat of an extremely violent inflammatory reaction, which lasted about a fortnight. A second trial of dilatation between the tumour and the meatus brought about the same results. After these experiences it was resolved to have recourse to perforation of the exostosis.

Accordingly a small drill was made having a lance-steel point of a width of 2 mm., and with that instrument, after three short sittings, the tumour was pierced through and through. It measured from front to back nearly 2 c.m., and on its other side the space was entirely free, being bounded by the membrana tympani.

Contrary to our expectations the operation, was except at the commencement of the first sitting, accompanied by no painful sensation, and what was still more astonishing, it was only followed by a very moderate inflammatory reaction.

After some days, during which the patient, from time to time, introduced a gum bougie of sufficient size, it was decided to increase the dimensions of the perforation by attacking its edges with a larger drill. This time again, the consecutive inflammation was only perceived by a little sensitiveness of the walls of the auditory canal, and by a very notable increase in the quantity of the sero-purulent secretion, which was there before the treatment.

The tissue of which the tumour was composed was only compact really on the surface. At the depth of some lines, it became spongy and could be pierced without pain by the blade of the perforator.

If, in this case, it had only been a question of re-establishing the hearing, the patient might have been dismissed, that object having been now accomplished. But there existed an otorrhœa, which made us detain the patient longer, in order to try a more complete cure, with a view to averting the danger, which might result from the stagnation and decomposition of matter in the depth of the organ.

Rather than have recourse to the use of graduated tents, an attempt was made to realise this intention by touching with the point of a probe, which had been dipped in chloride of zinc, the walls of the opening in the tumour, in order to cause the mortification of the bared osseous surfaces. The result that followed this proceeding was

Digitized by Google

the more satisfying, because, under the influence of this powerful caustic, not only was a marked increase in the diameter of the opening obtained, but there was also a perceptible lessening of the size of the exostosis.

From that time we knew on which side it was necessary to work, in order to complete the clearing of the canal. Two different parts of the anterior portion of the exostosis were then attacked, at first by means of a little saw, but the irritation that followed caused it to be abandoned for the blade of a probe-pointed bistoury, with which, and without much trouble, a fragment of bone in the form of an angle and representing more than a third of the tumour, was detached. After some more applications of chloride of zinc to the remainder of the tumour, it was deemed unnecessary to interfere further, and the patient was dismissed in September, 1875, cured of the affection; a slight otorrhœa alone remaining. When the left ear was cleared of the matter, he could hear the watch at about the distance of a metre.

This patient was lost sight of till March, 1876, when he returned to the hospital again, suffering this time from a deafness with tinnitus in the right.

The hearing distance on that side did not reach 10 c.m. It was, happily, an acute catarrhal otitis of the middle ear only, from which the patient suffered, and which some insufflations of ammoniacal vapours through the catheter set right; meanwhile, the tinnitus, although less intense, still persisted when the patient was dismissed.

The examination at this time of the left ear, the one formerly operated on, revealed to us the following state: The remainder of the exostosis formed a semi-lunar swelling of about 2 mm. in thickness on the posterio-superior wall of the osseous canal. The width of the meatus, even in that place, measured 6 or 8 m.m. The membrana tympani was in a normal state, dry and translucid, except its anterio-inferior segment, where there was a very opaque calcareous deposit, nevertheless the cone of light was sharply defined even in correspondence with that part. All running had ceased for some months.

We saw the patient for the last time on the 21st July, 1877. The state of the left ear was not modified, but in the right the membrana tympani, formerly translucid in its entire extent, presented a uniform calcareous filtration. Its luminous spot did not measure more than one m.m. Besides, the right ear continued to be the seat of a slightly whizzing noise.

At this date the hearing distance measured during the stillness of night, gave for the left, 1 metre 60., and for the right, 1 metre 50., if anything, the left ear was better than the right.

(To be continued.)

Department of Lunacy.

FEMALE PHYSICIANS.

A Bill for the employment of female physicians in State asylums for the insane, is now before the Legislature of America. As the said Bill is short, we give it in detail as follows:—

"The trustees of the several State asylums for the insane, namely at Utica, Poughkeepsie, Middletown, and Willard, shall employ one or more competent and well-educated female physicians to have charge of the female patients of the said asylums, under the direction of the medical superintendents of the several asylums, as in the case of the other or male assistant physicians, and to take the place of such male assistant physician or physicians in the wards for female patients."

On general principles we are in favour of the employment of female assistant physicians in the female wards of insane asylums. There is no doubt that they will do their work thoroughly and conscientiously; neither is there any doubt that a sufficient number of thoroughly educated female physicians can be found for such situations. Having said thus much, we call attention to a particular wording of the Bill, which is quite objectionable, in that it makes the appointment of these women to such positions obligatory on the part of the superintendent, instead of simply permissive.

We so strongly incline to the wisdom of the latter course, that we cannot endorse the Bill as it stands. Furthermore, as it at present carries the conviction on its face of being a striking example of class legislation, its defeat is certain unless some compromise is made. But, it is such an easy matter to alter the objectionable phraseology, that we have no doubt it will be done.

The Lunacy Laws.—On Thursday last, in the House of Lords, Lord Aberdare asked whether it was the intention of her Majesty's Government to introduce a Bill amending the Lunacy Laws. The Lord Chancellor said the Government were anxious to bring forward a Bill to consolidate the Lunacy Laws, and to introduce certain amendments on this subject which might not of themselves be of great importance, but which experience had shown to be desirable in the existing statutes. In the present state of public business, however, and at this period of the session, there was no hope of the Government being able to bring forward such a Bill.

Lunacy in Ireland.—In the House of Lords, on Friday last, Lord O'Hagan proceeded to call attention to the report of the late Irish Lunatic Inquiry Commission, remarking that that report was a most masterly document, embodying a large mass of information, and containing suggestions which appeared to him to be wise, judicious, and humane. A number of months had elapsed since it was presented; but nothing had as yet been done to carry those suggestions into effect. It seemed to him that there were circumstances and considerations in this case which would render prompt action most desirable. There was a very large class of lunatics in Ireland who were absolutely abandoned—who were useless to themselves and to their fellow creatures. At this moment there were in that country some 6,709 lunatics at large, and 3,352 neglected lunatics. In short, up to a recent period the treatment of lunatics, not merely in Ireland, but in England—and, indeed, all the world over—had been intolerably bad. He desired to know what steps the Government intended to take, with a view to carrying out the report of the commission. The Lord Chancellor said that the subjects referred to by the noble lord were of the greatest importance, and that they had and would continue to engage the most serious consideration of her Majesty's Government. Before long he hoped that the Government would be able to act upon some of the suggestions contained in the report of the Commission.

Hydrophobia Cured by Oxygen.—This case is reported in the *Lyon Medicale*, by Drs. Schmit and Zebeden, from Russia: The first symptoms of rabies appeared seventeen days after the injury. The patient was made to inhale three cubic feet of oxygen, and two hours afterwards he was in a state of perfect calm. Two days afterwards the symptoms of rabies reappeared, and and another inhalation of oxygen was administered with the same success. This time the inhalation was continued for forty-five minutes. A slight dyspnœa, which persisted after the disappearance of the graver symptoms, was treated for three weeks by the monobromide of camphor.

Irritability of the Brain.—If the irritation of the motor cortical region of the brain be prolonged (*Gaz. Med. de Paris*, Feb. 15, 1879), the corresponding muscles will return to their previous condition of repose despite

Digitized by Google

the persistence of the stimulation. This muscular relaxation is due to momentary loss of the cortical excitability. It is characteristic of this phenomenon, that the exhaustion is limited to the centre which is stimulated; when the stimulation is suspended for a few minutes, the centre spontaneously recovers its irritability. Irritation of the grey substance of the motor zone gives rise to epileptiform convulsions on the other side of the body. Irritation of even much greater intensity, when applied to the white matter underneath the cortex, after removal of the grey substance is not followed by similar phenomena; so long as the irritation is applied, the muscles of the corresponding links remain in a tetanic condition, but their contraction ceases as soon as the stimulus is removed.

MEDICAL PRESS AND CIRCULAR

Is published every Wednesday morning. Price 5d. Post free, 5½.

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6

,, IF PAID IN ADVANCE 1 1 0

*** Post-office Orders and Cheques to be drawn in favour of—

A. A. TINDALL, 20 King William Street, Strand, London, W.C

A. H. JACOB, 3 Molesworth Street, Dublin.

MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 8s. 6d. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office post free in advance, six dollars (£1 8s. 6d.) per annum; or direct from the Offices in this country for the same amount, if remitted by International Post-office Order

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 6, 1879.

LEGISLATION FOR DIPSOMANIACS.

ALTHOUGH it is long since we had much to say on this subject, it is not because we have failed to sympathise with the movement that has at last successfully culminated in the passing of the "Habitual Drunkards Bill." At the commencement of this movement, and when it was very doubtful whether the proposed legislation would be approved of by Parliament, the *Medical Press and Circular* was among the first to show the necessity of a certain class of habitual drunkards being placed under some kind of restraint; and now that the Bill has this session passed into an Act, which is to be in force for the next ten years, we shall persist in advocating not only an indefinite prolongation of its operation, but also the prospective introduction of compulsory clauses which will meet a class of cases at present untouched by this Act. We need scarcely remind the reader that the present Act is only a permissive one, and that the dipsomaniac can do as he likes about entering one of those "retreats" which are established for his detention and control. We are, however, convinced that until the Act is made in some respects a compulsory one, or is otherwise amended, some of the most deplorable evils arising from habitual drunkenness will remain unremedied. If there be any doubt on the matter, the address which has just been sent to the Home Secretary by the victim of a drunken wife is well calculated to remove it. The writer is a copying-clerk under the Local Government Board, and is in the receipt of only £117 per annum, after twenty-three years' service. From this address, which appeared last Friday in one or two of the morning papers, it will be seen that few lots could be more cruel than that endured by this poor hard-working clerk. His home is made wretched, his house is wrecked, his children are neglected, he himself made desperately miserable, and crime itself threatens to break into the sanctuary of his hearth—all through the conduct of an habitually drunken wife. After toiling all day with his pen, with an evening of extra work, he returns home to find this woman drunk in bed with her clothes on, and with no fewer than thirty-seven pawnbrokers' duplicates, relating to a variety of articles which she had pawned, even to the clothing of her youngest children. As he dared not trust his two elder boys with their drunken mother, he was obliged to send them to a boarding-school; and it may easily be imagined how heavily their maintenance there must press upon a man who, in these hard times, has an income of less than £120 per annum. "I need not," he says," "enter into painful details of the neglect of my two young children, and the general discomfort of my home. It is sufficient to say that my life has become one of distressing anxiety, utterly unfitting me at times for my ordinary employment, which is of a mental nature. . . . . I am in that unfortunate position that my life is in the utmost danger. It was only the other evening that, in her drunken frenzy, I was threatened to be stabbed; and to have things hurled at me is no unusual circumstance." Were this a rare or isolated case we should take no notice of it, but, unfortunately, as we medical men too well know, "homes that are converted by drunken wives into hells are shockingly numerous." And yet these are the class of cases in which the law, notwithstanding the passing of the "Habitual Drunkards Bill," is utterly powerless. Should it be thus? We think not, although we must acknowledge the great difficulties there are in the way of removing grievances of this kind. In its notice of this wretched story of modern life, the *Daily Telegraph*, which, perhaps more than any other paper, sympathises with and exposes the wrongs and miseries to which the poor are subjected almost despairs of finding a remedy for this class of cases. We are told that the present retreats for inebriety are too select and expensive for the class of people who most require control; that there is no place where the poverty-stricken dipsomaniac can be taken; that the present Bill is only on its trial, and that it is very doubtful whether Parliament would consent to grant large sums of money for the erection and maintanence of state asylums for dipsomaniacs.

It appears to us, however, that there are two main con-

Digitized by Google

ditions on which the solution of this great social problem must rest. In the first place the pecuniary difficulty is not the chief one to contend with. If we had, as has been suggested, "retreats" supported by voluntary contributions, they would be only partially successful, unless there was some law to compel the inveterate and incurable drunkard to enter them. No amount of persuasion would induce such a woman as the wife of this poor clerk to voluntarily put herself under the control of the keeper of either a public or private asylum. The pauper or working man, moreover, would be more prejudiced against such treatment than the gentleman, and women more than men. No class of people would prove more obstreperous than the drunken wives of poor men, and yet in no other class is enforced restraint more desirable. The well-to-do drunkard, if a bachelor, is only an enemy to himself. If a married man, there is still the loving mother to keep his house in order and look after his children. But when the poor man's wife takes to drink, the prospect is indeed a sad one; the husband out at work all day long, while the wife is at full liberty to bring ruination and misery where she ought to gladden and protect. No doubt a law such as that which enables the relatives of a lunatic to place him in an asylum, might be open to abuse. But then what law is there to which the same objection may not be made? And we see no reason why a compulsory Act might not contain so many safe-guards against any illegal or unwarrantable incarceration or detention of Her Majesty's subjects as to reduce to a minimum the abuse to which such an Act might be exposed. With regard to this much dreaded abuse, there is one advantage which the habitual drunkard would have over the lunatic. The lunacy or not of an individual is a question about which there may be two opinions; and no doubt in a few cases people have been kept under restraint when they might have been allowed to go at large. But no such mistake is possible in the case we are considering. There is no room for any refinement of diagnosis in the examination of the confirmed dipsomaniac. The most careless observer will see how the case stands as well as the most eminent expert. Not two, but a hundred witnesses will be ready to come forward to testify to the real character of the habitual drunkard. For this and other reasons we think that the fears entertained by many as to the results of compulsory legislation are, in a great measure, groundless. Then again, the monetary obstacles in the way of maintaining retreats for the reception of pauper patients have been somewhat exaggerated. The case might be met without Parliament being called upon to grant large sums of money for the establishment and support of great State asylums for the inebriate. Owing to the domestic inconveniences attending the removal of the head, or the mother, of a family, the law would be but partially taken advantage of. Only the worst cases would be sent to the inebriate asylum, and for a long time to come room might be found for the applicants in some of the institutions already existing, and which might be partly subsidised by the Government for the purpose. Moreover, as our contemporary has suggested, voluntary contributions might effect that which the Government, the country, or the Local Government Board may be unable or unwilling to do. At all events, before many years have elapsed, it will be desirable to do something for such cases as that to which we have just drawn attention. We have before us the second Annual Report of the "Society for Promoting Legislation for the Control and Cure of Habitual Drunkards," and we are glad to see that its committee do not intend to relinquish their efforts to promote further legislation on the subject. They will endeavour to prove the present Act a success as far as it goes, and to secure an indefinite prolongation of its operation as well as the addition of strong enabling powers to municipalities and other local authorities.

THE SELECT COMMITTEE.

So the Select Committee has finished its work for the present, and not till next session, if then, will any more evidence be taken. Among the witnesses who have yet to be examined is Mr. Bradford, the discreet and much respected representative of the Apothecaries Society. He was expected to give evidence last Tuesday, but preferred waiting till next year. His examination will be looked forward to with much interest, and will, no doubt, remove some of the prejudices that have been recently raised against a corporation which has done more for the medical education of the English general practitioner than all the other corporations put together. It is, however, to be regretted that another year must pass before the Committee can complete its labours, as the more delay there is the more risk there will be of the whole inquiry being almost barren of results, and of things being allowed to remain much in the same state as they were before. As regards the Conjoint Board Scheme it is "looming in the future" more than ever. On this question time is a great factor in favour of the policy adopted by the Scotch corporations; and they know it. Even the College of Surgeons are getting disgusted with the slow current of events, so that we cannot wonder at Mr. Simon saying that unless the questions involved in medical reform are settled very shortly, it would be the duty of the College to look to their own interests irrespective of a conjoint board or any other examining body.

Nor do we envy the task of the Committee in sifting the mass of contradictory evidence already before them. The adage about doctors differing has been painfully exemplified in the course of this investigation, and amid the diversity of opinion expressed on the subject the Committee or the Government will have no little difficulty in deciding what course to take. Some of the views and statements of the witnesses are open to a good deal of criticism, and were, in certain cases, absolutely erroneous. Such might be said of the evasive evidence given by Dr. Acland and the Nihilistic utterances of Sir Dominic Corrigan. Then we find Mr. Simon saying that the introduction of two or three general practitioners into the Medical Council would be turning that body into a "trades union!" and Professor Haughton falling into the error of supposing that the Apothecaries Society admitted women to their license, when they do nothing of the kind.

With regard to the Medical Council there is at present no indication of what will become of it. This much is

Digitized by Google

certain that it will not be allowed to remain as it is; and that its warmest apologists had very little to say in its defence. Dr. Lush put rather a significant question when he asked "would not the work be cheaper and more efficiently done if you abolished the Council altogether, and left it to be done by the Privy Council, as was the case in every other department of education?" We feel confident there are many who would answer this question in the affirmative, and, in fact, we have heard many express such an opinion on the subject, and if we consider the actual amount of work accomplished by the Council, the cost of the work, and the time it has had to do it, it must be confessed the abolition of this body altogether is not so unreasonable a proposition as it may at first sight appear. In his reply, however, Professor Haughton expressed a different opinion, and said "we should certainly not allow the Privy Council to interfere with the education of men in the University of Dublin." But the answer was a weak one, as even if the Medical Council were abolished and its work put into the hands of the Privy Council, the latter need not interfere with the medical education of the university student any more than it now interferes with the general education of an undergraduate at Oxford or Cambridge. However, the retention of a Medical Council, re-constructed according to the wishes of the profession, would be, perhaps, a preferable proceeding, and that in conjunction with the realisation of those other reforms which have been pressed upon the attention of the Government, would in all probability settle this long pending question of Medical Reform for many years to come.

THE CASE OF THE IRISH PRISON SURGEONS.

THE relation of the new Prison Board to its medical officers and the autocratic attempt of Mr. Charles Bourke to force upon them new duties with insufficient payment, in the teeth of the Act of Parliament, was brought last week under the notice of the Chief Secretary by Dr. Brunker, the Secretary to the Prison Surgeons Association, who was accompanied in his interview by the Marquis of Hamilton, Mr. Bruen, Mr. King-Harman, Mr. E. Dwyer Gray, Mr. Meldon, Mr. S. Moore, Major O'Gorman, Major O'Beirne, Lord A. Hill-Trevor, Lord Claud Hamilton, Hon. D. Plunket, Sir John Leslie, Mr. Macartney, Mr. Brooks, Colonel Colthurst, and Mr. Verner.

Dr. Brunker, in opening the subject, protested warmly against any gaol surgeon being offered, as Dr. Little, of Lifford, has been, £40 a year for all the duties of the office, including compounding. The salary of surgeons under the Grand Jury Act now commenced at £74 a year, and under the old system the amount was £65, though at Drogheda only £47 was paid. The apothecaries in each case where they existed were to be continued, but it was expected that the Irish Prison Board meant to ultimately abolish them. It had been considered that there ought to be two medical officers in some cases, whose opinions it might be necessary to take at the same time. According to the circular issued by the Prisons Board of the 3rd May, 1879, revoking the appointments of gaol surgeons, it did not dismiss the apothecaries, though the surgeons were summarily dismissed. Dr. Brunker entered a strong protest against a circular which had been issued to the governors of the gaols requiring them to report any irregularities on the part of any officer, including the medical officer. Now, this was harsh, if not offensive, to the prison surgeons. He would now explain to what extent the duties of the prison surgeons were increased. The medical officer under the old system was bound to visit the prison at least twice a week, and when required by the governor on the occurrence of illness of sufficient seriousness. He had nothing to do with the dietary or the sanitary arrangements of the prison. He had on his regular visits —and the frequency of these he regulated himself—to visit any prisoner in his cell who might being undergoing punishment. Certificates were paid for by fees in cases of lunacy. Under the new system all the old duties were continued, and in addition the medical officer had to bear greatly increased responsibility. He had to see every prisoner once a week, daily such prisoners as were confined to punishment cells, daily or oftener visit the sick, daily enter in his journal an account of the state of every sick prisoner, name of his disease, description of the medicines, diet, and other treatment ordered once in every three months, inspect every part of the prison, recording the result in respect to the cleanliness, drainage, warmth, ventilation, quality of provisions, insufficient clothing and bedding, quantity and quality of water, and any other cause which may affect the health of the prisoner. Watch and direct as to the state of mind of prisoners, and report as to the times when they require the special notice of the chaplain. The surgeons have also to make entries fixing upon themselves the responsibilities in the event of death in the prison, and to make detailed entries about every prisoner before being passed to his ward. They have also to certify whether a prisoner was fit for hard labour or to work the treadwheel. They had also to direct the amount of exercise, and be responsible with regard to infectious diseases and anything calculated to endanger the lives of the prisoners, and in addition the medical officers were called upon to fill up numerous certificates. It was no wonder that upon this statement Major O'Gorman had asked whether all this was to be done for £40 a year.

Mr. Bruen said it would be impossible with the fixed salary of £40 a year to attract a well-qualified doctor, and it was important that each prison surgeon should be fully qualified, having due regard to the great responsibility cast upon him by the Act. . . . . The services to the prisoners might not depend upon the number, but upon the extent, of the prisons in which they were detained, because the visits to the small jails had to be as numerous as those to the large jails.

In reply, the Chief Secretary for Ireland said, Well, as to the question of the scale of salary, it appears to be founded upon the idea that £40 is the general remuneration, but in fact, I may say that it only leaked out incidentally in a discussion upon the subject in this house, and the scale of payment rose higher under certain circumstances. There is also a point with regard to the compounding of medicines which seems to have been ignored, viz. :—that men of very high reputation compound their

Digitized by Google

own medicines, holding the position of medical officers in workhouses. Mr. Meldon says they are not of the eminence of the men who are prison officials, but I believe they are a very estimable body of gentlemen, and as a fact they do compound their own medicines. But whether they offend in doing this against their charters or regulations of their profession it is not for me to say. I am not, indeed, prepared to admit that there is anything *infra dig* or derogatory in medical men compounding their own medicines. As to the question of remuneration, that has not been fixed by the Irish Government, but by the Treasury. I have not had my attention called to the subject of the remuneration being inadequate, but I will consider the point and communicate with the Treasury on the subject. As to the compounding, I will make inquiries, and see how far the case of surgeons of jails is different from the case of men of high standing who compounded themselves, and see whether it is necessary that a different rule should be made in their case to what prevails in other branches of the medical profession. I assure you, gentlemen, that the whole subject shall receive the careful attention of the Government.

Although a previous experience of Mr. Lowther's platitudes, and of the chances of anything coming of his consideration, does not inspire the hope of much immediate result of this deputation, we are, nevertheless, of opinion that Dr. Brunker's representations, and the interest which he evoked on the part of the Irish members, will prove invaluable to his cause. We are reasonably certain that if the prison surgeons maintain a bold and firm front, they will defeat Mr. Bourke's attempt upon them. but they will probably not succeed in doing so without being prepared to re-open the question in the next session of Parliament. We heartily wish Dr. Brunker's cause success.

Notes on Current Topics.

The Bark Cure for Dipsomaniacs.

In the *Medical Temperance Journal* for July there is a good paper on this subject by Dr. Norman Kerr, who has had much experience in the treatment of habitual drunkards. Although he ridicules the vaunted virtues which have been ascribed to cinchona bark in the cure of drunkenness, and says that its pretensions are baseless, and its promises as fallacious as those of its predecessor, yet he admits that it is a valuable adjuvant to other remedies in the treatment of this affection. He thinks it of great service in restoring the broken tone and power of the shattered mental and physical constitution of the hapless dipsomaniac. Dr. Kerr justly observes that drunkenness is at once a moral and physical evil. While we must look to the will, however weakened, of the inebriate for an effectual and a lasting cure, his physical system must be strengthened and his craving for alcohol at least lessened. To aid in the accomplishment of such desirable ends, we can usefully employ various medicinal remedies, various hygienic measures, and various modifications of diet. Equally, and even of more importance, is the moral treatment of the dipsomaniac. "To whatever of will may be left to him—and very often, alas, there seems none at all remaining—we must look for true reformation and a permanent cure. If all moral power have vanished, and every spark of mental energy fled, the only thing left is to forcibly keep the miserable wreck of humanity where no alcohol is . . . . but no charmed potion will ever slay the dragon of dipsomania." Dr. Kerr gives several formulæ for making preparations of red cinchona, among which he recommends a decoction prepared as follows:—Add one ounce of the powdered bark to one pint of water, acidulated with 100 minims of dilute hydrochloric acid. Boil for ten minutes, and strain when cold. Pour water over the contents of the strainer till the product measures one pint. Of this give two ounces, or a wine glassful, every three hours, gradually diminishing the frequency and quantity of the dose after the first day, till in six or seven days it is reduced to a teaspoonful three times daily. The bark may sometimes be advantageously administered with other drugs. Mr. Moseley has been able to subdue the craving for alcohol by prescribing a non-spirituous combination of red bark, chisetta, and a hot general stimulant. But the most reliable temporary alleviation of this craving that Dr. Kerr has ever witnessed has followed the use of a full emetic dose of ipecacuanha. He also speaks favourably of the Turkish bath in these cases, as it, he says, tends to soothe the inordinately excited brain and nerve centres, and to induce sleep more refreshing and infinitely less dangerous than the sleep produced by chloral or opium, while it strengthens the body, calms the perturbation of the mind, and reawakens the appetite for food.

Letter-Answering.

The idiosyncrasy of some people, many of whom we know by experience to be within our own profession, not to answer any letter or trouble themselves with a written reply to anything, is a psychological item worthy of notice. It would seem that a good many people regard the writing, even of a postcard, with the same undefined repugnance as is felt by others to the making of their will, or the insuring of their life, and from such people, a letter, even when it relates to their own direct personal interests, never receives a reply. It would seem inconceivable that any member of the profession should run the risk of having his name struck out of the Medical Register, and his official rights taken from him, to save himself the trouble or the exercise of decisiveness of character to the very limited extent of writing a letter, and yet we are aware that a large number of practitioners permit their names to be removed from the Medical Register under the 14th section of the Medical Act, rather than give an answer to either of the two registered letters, which it is the duty of the registrar to address to him. We have received from the Irish Branch Registration Office a list of no list than twelve names who have thus been struck out of the Register, and we have reason to believe that several of the gentlemen who are thus honoured are alive, well, resident at their usual address, abundantly at leisure for letter-writing, but, nevertheless, quite incapable of the effort of replying to one.

It is not wonderful, therefore, that the editor of the Irish Medical Directory should complain of the hopeless impossibility of inducing the profession to reply to his circular, for though anyone can see that it is worth at

Digitized by Google

least a halfpenny, and the expenditure of one minute to ensure that one's qualifications should be accurately set out in an official directory, which is the recognised reference record of the profession in Ireland, yet experience tells us that an immense number of persons will not accept even that small trouble in their own direct personal interest.

For such people, we fancy, there must be something not quite right as regards their brain functions, and we cannot, therefore, encourage the editor with the hope that his importunity will induce his refractory constituents to cultivate the habit of replying to a letter.

A Healthy Town and the Causes of it.

The town of St. Louis, U.S., is remarkable for its low mortality rate, and for the generally good health enjoyed by its inhabitants. Within our recollection (says the *St. Louis Courier of Medicine*) there was the cholera of 1866-7 and the small-pox a few years later. With these exceptions we have been exempt from contagious diseases, such as scarlet fever, cerebro-spinal meningitis, diphtheria, &c. Several circumstances appear to contribute to the sanitary advantages of this town. It enjoys an unusual amount of fair weather. This is especially the case in the autumnal season; but in other parts of the year fair weather and bright sunshine prevail, "to the great benefit of organised life and the well-being of the human family." The summer rains mostly descend with great abundance and in a comparatively short time, thus thoroughly washing the surface of the well-graded streets and flushing the sewers. The city is about 350 feet above the level of the sea; and it rises gently from the banks of the Mississippi in the form of three broad terraces or miniature plateaux, until its highest or most inland terrace reaches a height of 200 feet above the river. Hence there is a good fall for the drainage, whilst 180 miles of pipe conduct the sewage rapidly into the river, and the quick constant current of which carries from the city front all refuse material. There is an average daily consumption of 22,000,000 gallons of pure river water, and this flowing through the sewers, with an occasional sharp rainfall, keeps them well flushed. There is also an excellent system of reservoirs for settling the water used for drinking purposes. Under the surface soil is a substratum of lime-rock, which probably acts the part of a drain and keeps the soil dry. Lastly, the city is not at all crowded, and its sanitary condition is under the supervision of an active and efficient health department, which looks to the prevention of epidemics by thorough vaccination, removal of nuisances, preventing over-crowding of tenement houses, interdicting the sale of unwholesome food and drink, the prompt removal of dead animals, slops, &c., &c.

The London Hospital.

We are sorry to see that the governors of this very large and useful hospital are obliged to make a general appeal to the public and profession for subscriptions in aid of their maintenance fund, which absorbs as much as £30,000 annually more than the fixed income of the charity. There is certainly no other hospital in London which has more claim upon the benevolence of the public than the London Hospital, and we trust that the appeal it is now making will not be in vain. We do not think, however, that the governors are showing good taste, or are studying their own dignity and position, in sending out in the form of a tract a reprint of an article which lately appeared in *Belgravia*, under the heading "At Night in a Hospital." Such a proceeding might do in the case of some tenth-rate or newly-established institution, but is scarcely consistent with the great reputation which the London Hospital has now for a long time enjoyed.

International Congress of Hygiene in 1880.

One very hopeful feature of hygiene is that the advancement of this department of medicine is not confined to one country. We therefore trust that the proposed meeting at Turin in 1880 will be a successful one. The first meeting of this congress was held at Brussels in 1876, and the next at Paris in 1878. A committee of organisation has already been formed under the able direction of Prof. Pacchiotti. The Italian Society of Hygiene will take an active part in the management of the work to be done; and there is every reason to believe that the sympathy in the movement shown by other countries will be a clear manifestation of the progress that preventive medicine is making, and of the necessity of studying all questions that relate both to public and private hygiene.

Memory in different Races and People.

M. Delaunay has made a communication to the *Societé de Biologie* respecting memory as studied under various biological conditions. The inferior races of mankind, such as Negroes, the Chinese, &c., have more memory than those of a higher type of civilisation. Primitive races which were unacquainted with the art of writing had a wonderful memory, and were for ages in the habit of handing down from one generation to another hymns as voluminous as the Bible. Prompters and professors of declamation know that women have more memory than men. French women will learn a foreign language quicker than their husbands. Youths have more memory than adults. It is well developed in children, attains its maximum about the fourteenth or fifteenth year, and then decreases. Feeble individuals of a lymphatic temperament have more memory than the strong. Students who obtain the prize for memory and recitation chiefly belong to the former class. Parisian students have also less memory than those who come from the provinces. At the *Ecole Normale* and other schools the pupils who have the best memory are not the most intelligent. The memory is more developed among the peasantry than among citizens, and among the clergy than among the laity. The memory remains intact in diseases of the left side of the brain, and is much affected in those of the right, from which it may be inferred that the right side is more the seat of this faculty than the left.

From a physiological point of view memory is diminished by over-feeding, by physical exercise, and by education, in this sense, that the illiterate have potentially more memory than those who know how to read and write. We remember, moreover, better in the morning than in the evening, in the summer than in the winter, and better in warm than in cold climates. Memory is therefore, to a certain

Digitized by Google

extent, in inverse proportion to nutrition; and more than that, it is in inverse proportion to evolution, since it is greatest in those individuals who are the least advanced from an evolutionary point of view—inferior races, women, children, the feeble, &c. In short, according to M. Delaunay, there is an evolution of the memory, which is first sensorial, literal, and then intelligent; but memory, properly speaking, diminishes inversely as the evolution.

The Mortality of Great Cities.

In pursuance of our comparison of the mortality of Dublin with that of other great cities, we append the relative death-rates of British and Foreign towns, as noted by the Registrar-General for the past week.

The rates of mortality per 1,000 last week in the principal large towns of the United Kingdom were—Portsmouth 10, Norwich 12, Bristol 14, Nottingham 14, Hull 15, Edinburgh 19, Birmingham 17, Salford 17, London 17, Glasgow 18, Sheffield 18, Newcastle-upon-Tyne 18, Liverpool 19, Bradford 19, Leeds 19, Wolverhampton 19, Leicester 20, Plymouth 20, Oldham 21, Manchester 21, Brighton 21, Sunderland 21.

The mortality of Dublin for the same time was 25 per 1,000, or about 10 per cent. higher than that of the other most unhealthy town as recorded.

The rates of mortality, in the principal foreign cities according to the most recent weekly returns, were—Calcutta 27, Bombay 28, Madras 32; Paris 23; Geneva 22; Brussels 26; Amsterdam 21, Rotterdam 27; The Hague 17; Copenhagen 18; Stockholm 23; Christiania 14; St. Petersburgh 37; Berlin 50, Hamburg 21, Dresden 24, Breslau 31, Munich 33, Vienna 30, Buda-Pesth 39; Rome 23, Naples 31, Turin 83, Venice 27; Alexandria 42; Brooklyn 21, Philadelphia 18, and Baltimore 34, per 1,000 of the population.

We recently pointed out that the neglect of sanitation in Dublin was actually costing 6,000 lives in each year, and yet we find the Government utterly lethargic, and the Sanitary Authorities of the city actually hostile to every suggested improvement. For instance, we observe that on the subject being recently brought under the notice of one of the Dublin sanitary authorities the mover of the resolution was reproached for making public statements which would frighten tourists and injure the shopkeepers' trade, and eventually the Board decided against taking any notice of the matter. It may be as well, once and for all, to state here that there is not a shadow of truth or reason in the defence of Dublin insalubrity frequently put forward—that an excessive number of provincial sick come to Dublin to die, and thus increase the death-rate. This objection, if there were any truth in it, applies with still greater force to London, Manchester, Liverpool, and all large cities, and as the Dublin death-rate is founded on a comparison with that of these cities, the defence has no weight at all.

But the excuse is actually untrue, because, as a fact, the deaths of hospital patients who come from the country are carefully eliminated by the Registrar-General, and the high death-rate is therefore in no sense due to them.

The New Northern University.

A memorial has just been presented to the Privy Council in reference to the proposed establishment of the Victoria University in Manchester. Bearing as it does the names of the Presidents of the London College of Surgeons and of the British Medical Association, and those of a great number of the leading hospital surgeons and teachers of London and the other teaching centres of England, it reaches the Privy Council with much influence. The memorial is very brief, and it expresses the opinion that it is "undesirable that the power of conferring degrees or licences to practise medicine or surgery should be granted to the proposed Victoria University on the following grounds:—

"1st. That there already exist *nineteen* such corporations.

"2nd. That the competition arising out of this number of licensing bodies is detrimental to the public and the medical profession, as tending to lower the standard of medical qualification.

"3rd. That the Manchester School of Medicine has no superior claims over other schools in London and the provinces which can entitle it to such a special distinction as that of conferring degrees to practise medicine or surgery."

There is much force in these arguments, and we question whether everything which the memorial contains may not be applied with equal force—*mutato nomine*—to the proposed New Irish University. We are strong in the belief that if the medical profession were to express its opinion as to the foundation of new qualifying bodies, it would, with one voice, declare that neither the public nor the science of medicine would derive any benefit whatever therefrom.

The Proposed Army Medical Examination.

On the occasion of the ceremonial of administering the declaration to the candidates for the Letters Testimonial of the Irish College of Surgeons on Thursday last, the President of the College, Dr. Mapother, stated that he was authorised to make it known that Sir William Muir, the Director-General of the Army Medical Department, would positively refuse his assent to the holding of the proposed army examination unless the long-promised warrant should be previously promulgated. We rejoice to observe this loyalty to the officers of his own department thus evinced by the Director-General, and we are convinced that the hint will have due effect. Indeed, we are aware that there is a large class of students now in Dublin prepared for examination, and anxious to enter the Army Medical Service, but determined not to offer themselves until they know what terms they are to expect. They unanimously decline to trust the Department or to have anything to say to the Queen's Service until the War Office is pledged in actual black and white to a fair reform of the existing system. In fact, the authorities are at length learning that the trick they played on a former occasion of promising a warrant and breaking their promise when their wants were satisfied cannot be repeated a second time. It is looked upon as quite likely that if Colonel Stanley and the Duke of Cambridge can

Digitized by Google

only entice enough students, however indifferent in quality, for the immediate and pressing wants of the Army Medical Service, they will at once drop the warrant and leave the medical officers in their present condition, until the time comes when the army can no longer exist without a proper medical branch.

Syphilitic Phthisis and S. Pneumonia.

In the *Wiener Med. Presse* Prof. Schnitzter, of Vienna, calls attention to the prevalence of syphilitic consumption. The symptoms, he says, resemble those of ordinary tuberculosis, and the diagnosis is some times difficult. The existence of syphilitic symptoms in any other part of the body should lead to the suspicion that the phthisis is of like origin; and so also should a confession of previous venereal infection. The recognition of the nature of the case is of the greatest importance, as specific treatment in the early stages will generally effect a prompt cure. In another German paper syphilitic pneumonia is differentiated from syphilitic phthisis. In the former the constitution of the patient is said to be robust. The objective signs of pulmonary induration, dulness, diminution of the respiratory murmur, more pronounced depression above and below the clavicles, short respiration, dyspnœa, and pain in the chest, all point to syphilitic pneumonia. The absence of cough, expectoration, and crepitant râles, and of fever, together with the good effect of iodic or mercurial treatment, are also in favour of this form of pneumonia.

The Medical Education of Women.

Judging from a letter received by a correspondent of the *Boston Medical and Surgical Journal*, the medical education of women seems to be receiving a good deal of encouragement from the authorities at Zurich. "Our cause," says the fair writer, "gains friends every year, and perhaps nowhere is it more noticeable than here. Even Hermann, our professor of physiology, has a woman for his assistant. She is a Swiss, and had worked with him as a student, so he knew what he was doing when he took her as assistant. And Prof. Rose, the surgeon, has had a woman to assist him for two years. I think I have not written to you since I accepted this position with him. I like the place very much, but have to work very hard to keep up with my work. [Here follows a description of the various surgical operations at which she has assisted, which includes nearly every operation ordinarily performed.] Prof. Rose treats me splendidly. I could not ask any more from him or from the other doctors, so you may imagine I am happy and contented."

The Quinine Duty in the United States.

On the last day of the session the Senate unanimously passed the House Bill removing the duty upon foreign quinine, so that the monopolies which have hitherto existed, and which made quinine rather an expensive drug in that country, will now be done away with. Alluding to the fact that a large manufacturer of this drug has given orders for his machinery to be stopped after present contracts were filled, the *Louisville Medical News* says it is melancholy to consider the number of men that will be thrown out of work by this decision, "but we will take comfort in the thought that, as the Messrs Powers and Weightman have bagged some twenty odd millions of dollars in the monopoly they possessed, their lot will not be as bitter as the drug they made."

Thymol-Camphor.

The *London Medical Record* calls attention to a communication of Dr. Symes in the *Pharmaceutical Journal*, in which he gives the results of his researches on the combination of thymol, chloral-hydrate, and camphor, acting as an antiseptic. The two former drugs are rubbed together in a mortar, and an equal quantity of camphor added, which liquefies the whole, and produces a powerful antiseptic. If thymol and camphor alone are rubbed together, they also become liquid, and this is a convenient form from which to prepare the ointment. Thymol-camphor can be mixed in almost any proportion with vaseline, *ung. petrolei*, or ozokerine, and the thymol will not separate, as in crystals, when thymol alone is used. A solution of thymol in water (1 in 1,000) is sufficiently strong for the spray in surgical operations. If used for the throat, milk and glacial acetic acid will be found to good solvents for it.

The Sanitary Authoritis at Memphis have isolated the city, so that there is now no communication thereto by land or water. Twenty-six deaths from yellow fever occurred last week, which is a considerable reduction upon previous returns, and the epidemic is abating.

The will of Dr. Tilbury Fox, late of Harley Street, who died suddenly, of heart disease, on July 7th, at Paris, was proved on July 16th by Mrs. Sophia Campbell Fox, the widow and sole executrix, the personal estate in the United Kingdom being sworn under £18,000.

We understand that out of eight candidates for the Membership of the Royal College of Physicians of London last week, five failed to acquit themselves to the satisfaction of the examiners. By way of contrast we would add that out of thirty-two candidates for the Licence only two were rejected. For the Primary twelve presented themselves and six passed.

We understand that Dr. Patterson Cassells, of Glasgow, was last week elected a corresponding member of the *Societé Royale des Sciences Medicales et Naturelles de Bruxelles*. Dr. Cassells' name is attached to the translation of those excellent papers "On Osseous Tumours of the External Auditory Meatus," by Dr. Delstanche, which have been appearing during the last few weeks in our columns.

The notorious "Dr. Sutton" was at the police court last week in a new character. He seems to have turned his attentions to various callings, since it was "proved to demonstration" that he was not the man for doctoring foolish young men. One of the last characters in which we heard of him was that of the peacock. He next took a fancy to a bycicle, and forgot to pay for it, and now he appears as an adept at the "confidence trick." For the

Digitized by Google

present his wants are being cared for by a merciful country.

Another quack was also in trouble last week, and when in extenuation of his offence he pleaded that whereas in former times he was frequently before the court, he had so far reformed that this was the first time for three years that he had been charged with an offence, the magistrate was inclined to take a lenient view of the case in consideration of his good behaviour, till a prison warder, with more zeal for his business than for the reformed doctor's feelings, said, "Please your worship, he's been under my care these three years." His worship thereupon altered his opinion.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Graduation Ceremony at the University of Glasgow.—On the 31st ult., the ceremony of capping the graduates in law, medicine, and science, took place in the lower hall of the Museum at the University. Principal Caird presided, and there was a large attendance of ladies and gentlemen. The medical graduates were presented by Professor Gairdner. At the conclusion of the ceremony Professor McKendrick addressed the graduates, and referring to the present agitation for medical reform, did so with the usual university bias. At present, he observed, a man may enter the medical profession by nineteen different portals, and it was asserted that these portals were not uniform, so that one might get in easier than another. To remedy this state of things the principle of conjoint boards had been strongly urged. It had been proposed to have three conjoint boards, one for each division of the United Kingdom, and to insist that every one must pass the examination of a conjoint board. Hence there would be three instead of nineteen portals, and Dr. McKendrick argued the evils of the present system would not be abolished, but only reduced to one-sixth. No mean achievement certainly. He did not admit that any inconveniences existed under the present system, but at the same time proposed a remedy in the shape of more efficient supervision on the part of the Medical Council, or by means of some mode of state examination. If that would not satisfy he would revert to the other alternative of a state examination on practical subjects subsequent to the student or graduate taking his diploma. It seems, he would approve in short, of any scheme which would not disturb the monopoly of the universities, nor diminish the emoluments of the professors.

Hospital Accommodation in Edinburgh for Infectious Diseases.—At a recent meeting of the Edinburgh Town Council, a representation was submitted from the Medical Officer of Health, in which Dr. Littlejohn pointed out that there was no provision in the New Royal Infirmary for the treatment of infectious diseases, and stated that it was of great importance the subject should be considered by the Council, involving as it did the health of the city, the satisfactory state of which could not be maintained unless adequate accommodation were provided for the speedy treatment of fever and other infectious diseases. Following up this representation, a sub-committee of the Lord Provost's committee ha[illegible]e recently with a sub-committee of the Public Health committee, while representatives of the two sub-committees had a meeting with a number of the managers of the infirmary regarding the matter. There was submitted to the joint meeting minutes of previous conferences between the two bodies, from which it would appear that the managers of the infirmary had undertaken to maintain 75 beds for the treatment of infectious diseases in the Old Infirmary buildings, leaving the local authority to deal with such diseases when they assumed an epidemic form. The representatives of the Council having indicated their determination to abide by the agreement in question, the managers of the Infirmary present stated that they would report the result of the interview to the next meeting of the Board of Managers.

Health of the Eight Principal Towns of Scotland.—The Registrar-General, in his weekly return of the births, deaths, and marriages in the eight principal towns in Scotland for the week ending Saturday, the 26th ult., says the death-rate was 17·4 per 1,000 of the estimated population. This rate is 3·8 under that for the corresponding week of last year, but 0·8 above that for the previous week of the present year. The lowest mortality was recorded in Greenock, viz., 14·2, and the highest in Perth, viz., 23·4. The mortality from the seven most familiar zymotic diseases was at the rate of 2·5 per 1,000, being an increase of 6·6 on the proportion for the previous week. Diphtheria, whooping-cough, and diarrhœa, were the diseases in which the increase occurred. The number of deaths from acute diseases of the chest is almost the same as for the previous week. The mean temperature of the week was 57·7, being 3·4 above that of the week immediately preceding, and 4·0 under that of the thirtieth week of 1878.

Glasgow Death-Rate.—The death-rate in the city of Glasgow during the week ending the 26th July, was 18 per 1,000 per annum, as compared with 16 the preceding week, and 24 in the corresponding week of 1878.

The Health of Edinburgh.—The mortality of Edinburgh still keeps low. Last week (ending 26th ult.), the registered deaths amounted to 70, giving a death-rate of 17 per 1,000. There were only two deaths from zymotic diseases, viz., 1 in the new town from measles, and one in the old town from scarlatina. The birth-rate is high.

Literature.

THE BRAIN AND ITS DISEASES. (a)

It is difficult within the limits usually assigned to such notices to give any but the most superficial view of the contents of such a well-digested and practical volume as the one before us. We perfectly agree with the author that the subject of constitutional syphilis—and as it usually comes under the observation of the physician—has not hitherto received the attention from the profession which its importance merits, and thus every honest and painstaking contribution to the subject commands respectful consideration. Considering the protean manifestations of constitutional syphilis, and their manifestly signal amenability to treatment, the field is an inviting one to cultivate. The present work is divided into eight chapters, in the first of which "The History and Nature of Syphilis" are succinctly epitomised; and in it the author professes himself an unicist in respect of the nature of the syphilitic virus, though admitting that according to individual idiosyncrasy the phenomena of syphilis may be modified; and in harmony with this idea, the opinion (in which we coincide with the author) is

(a) "The Brain and its Diseases. Vol. I.—Syphilis of the Brain." By Thomas Stretch Dowse, M.D. London: Baillière Tindall, and Cox. 1879.

Digitized by Google

expressed that a sore, "to produce its trail of sequence, need not (as at one time supposed) be of necessity a hard Hunterian chancre." Furthermore, it is pointed out that not unfrequently well-marked signs of constitutional syphilis exist where all evidence of primary infection is absent. Dr. Dowse seems to regard it as a recognised fact that the stages of so-called syphilitic fever can be completely upset (leaving diathesis or temperament out of the question altogether) by the mode of life of the person infected, and instances in this regard, its sudden evolution in the lower class of prostitutes, who live to drink and rarely eat. If this view has reference to the physical effect of the mode of life, and *its* influence on the evolution of the syphilitic phenomena, we agree with the author. Generally speaking, the class referred to are in a wretched state of health, and thus unable to resist disease so powerfully as the robust, and it is indifferent by what disease they are attacked, the power of resistance being reduced to its minimum, the conflagration, so to speak, is rapid and complete. Syphilis, therefore, forms no exception to the general rule. It is maintained in these pages that the syphilitic poison keeps dormant the tendency to gout, tuberculosis, and scrofula. Leaving its influence on gout an open question, it is undoubted that tuberculosis, scrofula, and syphilis frequently coexist, and it is all but impossible to differentiate in such cases the respective preponderance of the different morbid processes. The chapter concludes with a fair statement of the persistency of syphilis, the ravages which it is capable of causing, and the subtlety of its nature.

Chapter II. is devoted to the "Diagnosis of Constitutional Syphilis;" and several highly important cases are quoted to illustrate the symptoms, and somewhat by anticipation, the signal value of mercury and iodide of potassium in the disease under consideration. We perfectly agree with Dr. Dowse "that a heavy responsibility rests upon the shoulders of any medical man who neglects to enforce upon his patients the absolute necessity of a mercurial course in the primary stage of syphilis, for an incomplete hesitating treatment of external syphilis specially predisposes to subsequent affections of the nervous system." We are very gratified to note that Dr. Dowse has thus not been carried away by that servility to change and fashion so detrimental to medical science, and that his highly instructive cases afford the most signal testimony to the efficacy of the two preparations mentioned, in the treatment not only of primary, but of secondary, syphilis—a fact one of the most certain in the whole domain of therapeutics. The distinguishing features of cerebral syphilis are clearly indicated, and due attention is directed to syphilitic affections of the spinal cord.

Chapter III. treats of "Diseases of the Sympathetic Nervous System." Four interesting cases of vaso-motor derangement are recorded, and the efficacy of the mercurial treatment further demonstrated.

In the record of case XI., "Unaccountable Nervous Systems" is obviously enough a misprint. The dependence of the symptoms on syphilis in this case, however, is not conclusively demonstrated. It is hardly justifiable to conclude, in the absence of specific indications of syphilis, that because a cure has followed the exhibition of mercury, the *fons et origo mali* must of necessity have been syphilitic.

"Disease of Peripheral Nerves and Neuralgias," is treated in Chapter IV. It is indicated that while the nerve structure may itself be primarily the seat of specific degeneration or neoplasm, it is rather from pressure than from intrinsic inflammatory changes that the nerve substance becomes affected, or from the infiltration into it of gummatous inflammations. A case illustrating the effects of syphilitic changes at the base of the brain, involving the optic nerve and Gasserian ganglion, is reported, and one of supposed syphilitic neuralgia of the sciatic nerve, with atrophy of the right buttock.

Chapter V. is devoted to "Treatment," and at the outset the encouraging remark is made that "of all diseases of the brain and nervous system, I may say that there is not any which yield more readily and rapidly to appropriate treatment than do those which are due to, and have, syphilis for their origin;" while obviously enough much will depend on the stage at which the disease is attacked, the prognosis being grave as there are indications of structural change, and *vice versâ*. In the case of syphilitic lardaceous changes, it is contended that mercury especially, and iodide of potassium, are as hurtful to the individual as opium would be in the coma of uræmia. This being so, it is not clear why it is remarked by the author, "I preface the administration of bichloride of mercury in these cases by giving for three or four weeks the tincture of the perchloride of iron three times a day." Stimulants, cautiously used, are indicated in these cases.

While Dr. Dowse's book is, on the whole, excellently written, the foregoing and the subsequent paragraphs are not a little enigmatical: "I maintain that it is utterly useless to endeavour to be empirical in the treatment of diseased states. Yet there are many of the syphilographic school who would have us believe that in syphilis—no matter so long as it is syphilis—mercury or iodide of potassium is at once demanded. I must say that my own practice does not bear out this conclusion; but if there is one thing in therapeutics of which I am more certain than any other, it is that mercury is the antidote to syphilis."

Now it has always occurred to us that empiricism was unfortunately the rule in the treatment of disease, and that the impossibility seemed to be in the opposite direction. It is certainly far more easy to be empirical than rational; and many a worthless reputation is based on self-sufficient and self-deluding imperfect observation; hence the value of empiricism depends upon the observer; hence the encumbrance of medical science with "false facts." The treatment of syphilis by mercury and iodide of potassium is purely empirical; but it is based on the all but concurrent testimony of the best observers of the present and preceding times. Not so the multitude of ephemeral remedies which, having their day, cease to be, and subserve solely the unfortunate purpose of hampering medical literature, and perplexing noviciates in our art. Notoriety, as contra-distinguished from reputation, is thus made in a twofold manner; on the one hand, by a species of iconoclasm which unblushingly denies the observation and experience of centuries: on the other by alleging the most unlooked for phenomena from the most commonplace appliances—untruths equally reprehensible, encouraged unstintingly by medical journals, and the propensity to talk and invent wherever two or three *savans* (?) are met together.

If mercury be, as Dr. Dowse alleges, the "antidote to syphilis," it would seem reasonable that mercury should be administered in every form of syphilis; but to maintain that mercury is an absolute antidote to syphilis is to put the undoubted efficacy of the drug, it appears to us, in too strong a light; for while it certainly subdues the manifestations of syphilis in a most striking manner, it is open to the gravest doubt if syphilis is ever completely recovered from. It is possible, however, that in certain cases the internal administration of mercury may be contra-indicated; but we are not precluded from the aid of the drug in consequence, seeing that the mildest, and possibly the most efficacious mode of administering mercury, particularly in secondary syphilis, consists in the mercurial vapour bath; and it was not without considerable surprise that we noted the remark of Dr. Dowse, that he had not found any special advantage from mercurial baths. This chapter concludes with general remarks on treatment, to which no exception can be taken, and which call for no special observations.

In chapter VI. "Hereditary Syphilis" is reviewed. Two woodcuts are given illustrating the text, and several interesting cases are recorded.

Chapter VII. treats of "Syphilitic Epilepsy." The characteristics of epilepsy comprise impairment of volitional consciousness, with perversion of sensory or motor function, or of the two combined. While epilepsy from acquired syphilis seems to be a rare disease, it is held that primary idiopathic epilepsies are more frequently due to hereditary syphilis than they are to any other cause. This chapter is an interesting one, and may be *par excellence* described as the metaphysical one of the book.

The concluding chapter (VIII.) is devoted to "Pathology," is mainly made up of interesting and valuable cases, and rather supplements the foregoing chapters than introduces any special novelty. It will repay perusal equally well with the others. The woodcuts and coloured lithographs are excellent, and serve to illustrate the text in an interesting and instructive manner. The chief value of this work consists in the fact of its being based so largely on personal experience, and of exhibiting so clearly the incalculable efficacy of mercury and iodide of potassium in a large and important class of cerebral affections. The work is well-written, is not encumbered with extraneous nor

Digitized by Google

irrelevant details, and may justly be characterised as a valuable contribution to the important subject of which it treats. It remains just to add that the duties of the printer and publisher have been admirably performed, and that an excellent index adds materially to the value of the work.

THE WASTING DISEASES OF INFANTS AND CHILDREN. (a)

THAT Dr. Eustace Smith's efforts on behalf of the profession have met a want, and that he has rightly interpreted it, is sufficiently evident from the fact of the appearance within ten years of a third edition of his manual on the Wasting Diseases of Infants and Children.

Those who compare a new edition of a work with the older issues of it cannot but experience a mingled feeling of pleasure and pain; of unfeigned pleasure in every token the new edition presents of more perfect knowledge, of more exact information, of any real emendation of former methods of expression; of pain that some of the old illustrations come not as of yore, that here or there something has or has not been added, or something has not been subtracted, which was respectively either wanting or redundant in the older edition of the work.

Some such thoughts as these have passed through our minds while reading anew the third edition of this useful book.

Now, as well as when first written, it continues to supply a manifest desideratum, for as yet the text-books have not discussed with sufficient earnestness the subject-matter therein treated. The very nature of such text-books precludes anything like an exhaustive consideration of wasting disease in infancy and childhood; and such being the case, the subject is fortunate in having in the author of this manual one so well qualified and so able to discuss it as he has done.

Of the two aspects of a review—viz., praise and criticism—it were easier and more pleasant first to consider the former, but it will be better here to mention in friendly criticism some points in the third edition which appear worthy of critical notice.

First among these is the absence of the names of authors and authorities, of the references and of the sources of information to which the author—judging from the liberal acknowledgments made in a former edition—appears to have been indebted for a very large portion of the information he has so well collated and collected for the profession. In reference to this remark we would note here and there the appropriate mention is absent of such names as those of Trousseau, Rilliet and Barthez, Sir William Jenner, Dr. Underwood, Dr. Dunglinson, and others. Again, many of the clinical observations so laboriously detailed by the author, were obtained in connection with recognised institutions to which he was attached as physician; and as every man is, or should regard himself, a debtor to his profession, all who obtain and publish information in connection with public appointments do well who follow the example of the great masters of our art, and gracefully acknowledge, however briefly, their obligations.

At page 37, in reference to the preparation of cow's milk, we observe with regret that the following passage occurs: "The whole is then put into a perfectly clean feeding bottle, and is heated to a temperature of about 95° F.," *horribile dictû*, "by steeping the bottle in hot water." This is a legacy from the past generation which should be speedily expelled from the nursery; and so long as our recognised authors tolerate and promulgate the advice, so long will the reform be in abeyance, and the evil results of such a practice abound. Theoretically it appears sound and easy of application, but all who watch the effect in practice know full well that even a good nurse will not trouble herself much about the details of the warmth obtained—sometimes the milk is scalding hot, at others barely luke warm, and as a consequence this practice is no small factor in the production of subacute gastritis in infancy.

At page 94, probably owing to a lapsus, we notice Recipe, followed by the genitive instead of the accusative, which in the other prescriptions, followed by ad., &c., so correctly appears.

There is hardly a chapter in the book that will not repay perusal, and if there is no great evidence of originality in the work, yet the information given is presented in a clear and readable form; and the relation between cause and effect in reference to diagnosis, prognosis, and treatment is lucidly expressed.

In the Introductory chapter the subject of wasting is considered generally, and the relation of remedies employed in its treatment discussed on the broad lines of their respective physiological and therapeutical value as external applications and internal remedies.

Chapter I. is devoted to the consideration of simple atrophy from insufficient nourishment. This portion of the work is very important in relation to the forensic aspects of wasting; and we think the author would have done well to have discussed the pathological relationship between starvation, wasting, and death. Clinically, it is often painfully interesting to watch the slow, insidious, but certain, approach of death when starvation, through ignorance, has been the cause of a wasting, the consequences of which we are summoned too late to avert. A still further interest attaches to the pathological aspect of wasting. A knowledge of the true pathological condition caused by insufficient nourishment would be a valuable guide to ascertaining the cause of the pathological condition, when, as for instance in a medico-legal necropsy, the post-mortem appearances are all that the practitioner has to guide him, in directing the coroner and jury, as to the cause of death. Wilful murder often results from systematic starvation, and its attendant wasting. Chronic diarrhœa leads to virtual starvation, wasting, and death. The pathological relationships are diverse and distinct, and should offer materials for a sure and certain differential diagnosis, which might be based on the pathological state alone.

At pages 76-78 the anatomical characters of chronic diarrhœa are discussed, based on information, such as may be found in Dr. West's work on the Diseases of Infancy and Childhood. We would be glad to see the pathology of wasting from insufficient nourishment likewise treated, and the lines of demarcation between the two states differentially expressed.

In treating simple atrophy, as well as in the directions for the treatment of other conditions associated with wasting, the author has given the profession a full benefit of his individual experience; and with such a guide at hand it would be difficult to avoid treating such conditions as the author describes with accuracy and success.

In the treatment of chronic diarrhœa sufficient guidance is wanting as to the quantity to be employed as an enema. In one case half-an-ounce of thin warm starch is mentioned as the vehicle; in another, no less than four ounces of mucilage of starch; in another, one grain of nitrate of silver is to be dissolved in five ounces of water. Again, no information is given as to the relative value of warmth and cold for enemata. Vogel insists on the value of small enemata for infants, from one to four drams, following a preliminary enema of warm water, to evacuate scybalæ, as recommended by the author. In America the use of cold, even iced, water enemata has proved most useful in the treatment of chronic diarrhœa without any internal treatment whatever. The ambiguity which surrounds this part of the chapter needs revision.

In Chapter III., on Chronic Vomiting, the use of enemata is mentioned in the synopsis, but scant notice of how or when to employ them occurs in the text. Rightly administered in all forms of vomiting, we apprehend in infancy and childhood that enemata might be employed more frequently than is the case.

In the chapter on Rickets will be found a good *résumé* of the subject, and in its treatment the author has brought to the front a large amount of clinical experience which he applies to the various stages and complications with scientific earnestness and candour. Vogel insists upon cod oil being useful to a certain class of rachitic patients, while to others it is practically detrimental; and it would be well did the text-books and manuals which treat of rachitis differentiate between them.

One of the most interesting, practical, and, to our mind, original chapters in the work is the sixth, devoted to Mucous Disease. Many years ago, we remember reading it, and how

(a) "The Wasting Diseases of Infants and Children." By Eustace Smith, M.D. Lond. Third Edition. London: J. and A. Churchill, New Burlington Street. 1878.

Digitized by Google

its clinical accuracy at once gave an interest to many cases previously obscure (for it threw light, by means of which the differential diagnosis between wasting from this cause and several others might be established). No doubt mucous disease is an important factor in causing somnambulism, but we cannot go quite so far as the author, and state—"in fact most of the cases of somnambulism in children are due to this cause." Enlargement of the tonsils, as pointed out by Mr. Warrington Haward and others, is a very frequent cause; also reflex irritation from adherent prepuce, as mentioned by Prof. Sayre, a not uncommon one. May not the mucous disease, the enlarged tonsils, the adherent prepuce, each and all prove excitants to a nervous system undergoing rapid development, readily excited and prone to manifest cerebro-spinal activity, arising from one or many of several peripheral irritations?

(To be continued.)

THE PHYSIOLOGY AND PATHOLOGY OF THE SYMPATHETIC SYSTEM OF NERVES. (a)

This contribution to the literature of the sympathetic nerves is one of several essays upon the subject sent in to compete for the Astley Cooper Prize. In fact, the judges awarded it the prize, but in consequence of its being the joint production of two individuals the adjudication could not be maintained upon legal grounds.

For the student who wishes to make himself conversant with the views of the most able investigators concerning the physiology and pathology of the sympathetic system of nerves, this essay should be read most carefully; for in it he will find all that is known of the subject. We think, however, there is little to be learned from it by men who keep themselves acquainted with the leading writing of the day. In other words, there is little that is new or original about it. Its chief merit (and one of no mean order) seems to us to consist in its being a singularly concise and able *résumé* by physicians and physiologists who are practical masters of their subject, and who have collated with great care and wisdom the views of others.

The many vexed questions involved, and the different opinions held by authors regarding the function of many of the sympathetic centres are carefully and succinctly brought before the reader, so that upon the whole the essay deserves high commendation.

We regret, however, that the translator's work is not so satisfactory, the errors in proof-reading are very numerous, and the string of errata too long even for a work ten times its size.

Literary Notes and Gossip.

We are glad to know that medical authors will be well represented at Cork this week. Messrs. Churchill are exhibiting no less than 86 new books and new editions (a list of which will be found in our advertisement sheet), published by them since the last Annual Meeting of the Association. Messrs. Longmans, Smith Elder, Baillière, Tindall, and Cox, and other leading medical publishers, have also large stocks, under the care of Messrs. Fannin and Co., of Dublin, whose stall in the museum the profession should not fail to visit.

* * *

Amongst the novelties exhibited in the literary department of the Cork meeting, are a series of *Movable Atlases* illustrating in sections by means of superposed coloured plates the entire human economy. When they originally appeared in France we were much struck with the ingenuity displayed in the formation and fixing of the delicate internal organs, and we welcome the effort now being made by Messrs. Baillière, Tindall, and Cox, to reproduce them with English text in this country. The parts before us are the *Trunk*, the text being translated by Dr. R. Hunter Semple, and the *Throat*, with the *Mechanism of Voice, Speech, and Taste*; text by Mr. Lennox Browne. The *Female Generative Organs*, with text by Dr. Palfrey, is, we understand, nearly ready, and the *Eye and the Mechanism of Vision* will shortly follow with text by Mr. Henry Power. Members of the Association will do well to make themselves acquainted with these works.

* * *

Owing to the lamentable death of the Princess Alice, the subject of diphtheria has created in Germany, simultaneously with this country, a considerable amount of attention, while it has cumulated in Royalty taking the matter up, and offering in the august person of Her Imperial Majesty, the Empress of Germany, a prize of £100 for the best essay on the subject. Competitors may use the English, French, or German language, and must send in their essays by the 15th December, 1880. No one need, therefore, complain of the shortness of time allowed, and every idea can be well-digested without hurry. The adjudicators are:—Professors Klebs, of Prague; von Nägeli and Oertel, of Munich; Thiersch, of Leipzig; and Liebreich, Virchow, and Langenbeck, of Berlin; an array of continental celebrities sufficient to limit the number of competitors to reasonable bounds.

* * *

Our readers will remember the controversy which raged in the pages of the *Contemporary Review* in the spring of this year; how the representative men in the profession seemed to be drawn irresistibly into the contest, and the medical and lay press floating on the current of divergent opinion, threshed the subject to tatters. And, as "after a storm comes a calm," lovers of a quiet glass still indulge in their luxury, evidently believing that the motto of a celebrated preacher but wrong doer, is that of the profession: "Do as I say not as I do." But Mr. Strachan, the enterprising publisher of the *Contemporary*, is not so content, and so he issues to-day "in one volume, the Alcohol Question, by Sir James Paget, Sir Wm. Gull, Drs. Bennett, Bernays, Brunton, Garrod, Moxon, Murchison, Radcliffe, Wilks, and Mr. R. B. Carter," a reprint from the magazine. What an array of big guns for a few shillings!

* * *

Time was when the house of Robert Hardwicke was almost as familiarly known to the profession as the House of Commons to its members. Less than a quarter of a century ago, there were but two medical publishers of note in the metropolis, John Churchill and Robert Hardwicke. There were one or two others on a small scale, like Renshaw who survives; and Walton, who produced some good books, but finally failing in business died, it is said of "a broken heart." There were also the houses of Longmans, of world-wide reputation, as classical and school publishers, with one or two medical books only, and Bailliere's, which was chiefly noted as *the* foreign medical establishment. Now all this is changed, and the purveyors of the medical "food of youth, and the delight of old age," have trebled; and while one like Robert Hardwicke has passed away, another has sprung up to take his place, aye to remove it altogether, so that "the place which knew him once, shall know him no more for ever."

* * *

Henceforth the name of Hardwicke, medical publisher, will be removed from the escutcheon of fame, and the House in Piccadilly once-famed for its "food for the mind," is being rapidly converted into one for the supply of "food for the body;" a restaurant in fact. It may not be unnaturally asked by some, why obliterate a name so well-known to the profession and the public? We have taken the trouble to inquire, only to find what we already knew, that the last days of poor Hardwicke were the reverse of satisfactory to authors, that one-by-one his friends dropped off, being unable to get statements or aught else satisfactory about their books, until the name became derogatory rather than famous to its new proprietor. Hence Mr. Bogue's decision to drop the name of Hardwicke, so that works issued by this house will in future bear the name of David Bogue only, and the address, 3 St. Martin's Place, Trafalgar Square.

* * *

Messrs. Macmillan have now in the press what is likely to prove of great interest to anthropologists, viz., the first portion of a work called "Man and Civilisation," on which the author, Mr. E. B. Taylor, F.R.S., has been long engaged. It is designed to serve as a text-book of anthropology, and will be printed uniform with Professor Huxley's "Physiography." Mr. Ray Lankester has undertaken to contribute

(a) "The Physiology and Pathology of the Sympathetic System of Nerves." By Drs. Eulenberg and Guttman. Translated by Alex. Napier, M.D. London: J. and A. Churchill.

Digitized by Google

chapters on the anatomical portion of the subject. The book is expected to be ready by the end of the year.

* * *

As a step towards a universal halfpenny letter-rate, may be mentioned the new postal regulation which comes into operation on the 1st September, by which almost anything short of an actually written letter may be sent under a sealed envelope, with the ends slightly open, for a halfpenny. It will come under the book-post regulations, and is officially defined as "a letter which from internal evidence appears to be intended for transmission in identical terms to several persons, and the whole or greater part of which is produced by means of ordinary type, engraving, lithography, or any other mechanical process." Sixpenny telegrams are, we understand, also under the consideration of the authorities.

* * *

House and Home, a very excellent little journal, devoted to the purpose of illustrating and discussing matters of sanitary interest, as they chiefly affect the lower classes, is giving some excellent portraits of eminent members of our profession. Of the accompanying biographical sketches, we cannot speak so highly, albeit they are truthful in most particulars. Everyone will endorse what is said of the late Dr. Parkes, that his work was of that rare order which sunk self in everything he did for the general weal. That the sketch of Dr. Richardson is equally happy, some may be inclined to doubt. Few have probably done so much to further the cause of temperance as this gentleman, and much honour is due to him therefore; but it can hardly be of so disinterested a nature when he has been known to charge as much £25 for the delivery of a lecture on the subject he has so much at heart.

* * *

To the curious in history, M. Grave's work just published at Nantes, on the "State of Medicine and Pharmacy in France," will afford an immense field of observation and research. In it the author traces the History of Medicine and Pharmacy from the Egyptian, Grecian, and Roman eras to the present time. From the Dark Ages when medicine and pharmacy were in the hands of two classes—wandering Jews and Arabs, who hawked their wretched drugs through Central Europe; and the clergy, who M. Grave contends, "were no more than commentators, or imitators of Galen. He had made some renowned mixtures; mixtures were therefore the rule. The study of medicine led to the sale of drugs, and Pope Pelagius II., at the end of the sixth century, forbade the clergy and ecclesiastics to vend medicines like merchants or apothecaries. In the fourteenth century the faculty of medicine was founded at Paris. The members of the faculty were required to discontinue at once all manual labour, or to employ subordinates to handle the pestle and mortar on pain of exclusion from the dignity of master of arts." This opens up a good many thoughts for discussion: who is a physician? what diplomas enable him so to style himself? can he dispense his own medicines, &c.? Of these, however, our columns have had enough of late, and we forbear.

* * *

THAT the critic should be criticised is no more than is expected by those engaged in literary pursuits. Fortunately, for our peace of mind it does not take the form of such strong aperients as the following:—"To the editor of the *Cincinnati Lancet*. My very amiable (?) truthful (?) impertinent assenine friend: As a reviewer you have immortalised yourself as the chief among ignorant, contemptible, and infamous liars and imposters. You are like the 'stumped' shool-boy; you throw down the book, and give it the best *cussing* your mortification brings to your aid. Bray again! Yours with contempt, C. T. Reber, M.D." The above is an exact reprint of what appeared in the last number of our American contemporary, and was probably drawn forth from the exasperated author during the present tropical heat on the other side of the Atlantic, on account of the following criticism:—"As a specimen of *asylum literature*, as an evolution from the inner consciousness, this book would be a success were it not for the fact that the doctor does not disdain to recommend as a cure the use of his hypo-thermata quinine." The editor is still fanning himself.

* * *

WHEN in 1804, Edgeworth wrote that by a careful computation there were as many as 80,000 persons in Great Britain, being nearly one-hundredth part of its inhabitants who could read, he probably considered that a marvellous state of intelligence at which the nation had arrived. At the present time this would average, allowing for increase of population, about one reader in every three hundred persons living in these Islands. What would that celebrated writer exclaim at the progress of education now? It has been computed by some that about one-sixth of the population are readers; our excellent contemporary, the *Leisure Hour*, puts it at one half, which, however, we deem excessive, and are rather inclined to put it at one-fourth or about 8,000,000 in the United Kingdom. A medical man who moves about much, especially among the poor, can form a pretty fair estimate.

* * *

THAT the British Association for the advancement of science is strongly cosmopolitan, none will deny, when its choice of presidents is taken into account. Thus there have been popular leaders in science, such as Sedgwick and Murchison, Herschel, Brewster, Lyell, Huxley, Dr. Hooker, and Dr. William Spottiswood, the retiring president. This year the great exponent of zoological literature, Dr. George Johnston Allman has been chosen. This writer, besides a "History of Fresh-water Polyzoa" and a "Monograph on Gymnoblastic Hydroids," has contributed numerous memoirs to the Transactions of the Royal Society, the Royal Irish Academy, and other learned bodies with which he is connected. The new President for several years occupied the chair of Natural History in the Edinburgh University, and is well and favourably known in the world of literature.

* * *

MESSRS. LIPPINCOTT & Co., of Philadelphia and London, have just issued an English translation of Wurtz's "Elements of Modern Chemistry." The work will be welcomed by those who are already familiar with the same author's "History of Chemical Theory."

* * *

MR. JOHN ANGELL, F.C.S., Senior Science Master at the Manchester Grammar School, has reprinted in pamphlet form, the letters contributed by him in reply to Sir Wm. Gull, and others, on the "Alcohol Question." His contentions are good and ably supported by evidence, and will be read with interest by all who have followed the discussion in the public press.

* * *

NEW BOOKS AND NEW EDITIONS.—The following have been received for review since the publication of our last list, July 9:—"Movable Atlas of the Throat, showing the mechanism of Voice, Speech, and Taste," by Dr. Witkowski and Mr. Lennox Brown, F.R.C.S. "An Introduction to Commercial Organic Analyses," by A. H. Allen, F.C.S. Guy's Hospital Reports, vol. xxiv. "Injuries and Diseases of the Lymphatic System," by S. Messenger Bradley, F.R.C.S. "A Treatise on Hydrophobia," by J. McNeill, M.D. "Hygiene of the Sea," by Dr. Victor Grazzi; Translation by F. W. Wright. "The Student's Guide to Surgical Diagnosis," by C. Heath, F.R.C.S. "Sleep and Sleeplessness," by J. Mortimer Granville, M.D. "The Skin and its Troubles" (Health Primers). "L'Anèe Medical for 1878," par le Dr. Bourneville. "The Value of Human Life," by the Rev. F. Dodd, M.A. Transactions of the American Medical Association, vol. xxix. "Klein and Smith's Atlas of Histology." Part IV.

* * *

PAMPHLETS.—The following have been received since the publication of our last list, July 9:—"Medical Education and Medical Organisation," by Walter Rivington, F.R.C.S. "Tetanus: Cure by Nerve-Stretching," by H. E. Clark, M.R.C.S. "The Mortality from Intemperance," by Norman Kerr, M.D. "A Birds-Eye View of the Scientific Claims of Vivisection," by A. P. Childs, F.R.C.S. "American Nervousness," by G. M. Beard, M.D. "A few Remarks on proposed Lunacy Legislation." "Second Annual Report of the Society for Promoting Legislation for the Control and Cure of Habitual Drunkards." "Medical and other Notes on Arcahon, Biarritz, Pau, and the principal watering places of the Pyrenees," by Dr. Roth. "Report of the Association for the Oral Instruction of the Deaf and Dumb." "Remarks on the Routine Use of the Ophthalmoscope in Cerebral Disease." By J. Hughlings Jackson, M.D.

Correspondence.

THE DISCUSSION ON THE USE OF THE FORCEPS IN LINGERING LABOUR.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your leading article, July 30th, on the above subject, you remark that I "did not give a very direct answer to the question at issue, but incidentally admitted that it had been my practice to use the forceps in certain cases before the os uteri was fully dilated." Will you kindly permit me to occupy a small space in reply, as I think you have misunderstood the whole tenour of my remarks.

In the first place, I alluded to two publications of mine, the first, twelve years ago, in which I had already affirmatively answered the questions at issue, and in which I had flattered myself I had laid down rules for our guidance; based, not on numerical computation, but on the states of the patient, the varying and opposite conditions of whom in relation to this matter, I think I may claim as having been the first to clearly point out. These I reiterated in my remarks, believing them to be an invaluable guide in practice.

Second. In the answers I gave to the two questions which preceded the propositions, I gave distinct assent, the first being "Is lingering labour dangerous to mother and child?" The second, "Is the forceps necessary or useful before the full dilatation of the cervix?" I said I had seen many sacrificed for the want of this help.

Thirdly, I then, in giving assent to the propositions, proceeded to point out the conditions which occurred necessitating the use of the forceps, and argued that when the necessity compelled us to act we were to do it as carefully as possible, but not terrified by the accounts given of the dangers, showing that damage to the os after the forceps use were not always the result of their use. I was anxious to insist that it was by the *condition of the uterus* we were to judge, and not by the fact that we may have exceeded or not the proper percentage. The terms of the proposition required in the answers more precision than "generally." These words permitted the speakers to widen their remarks, but unless the remarks were more precise, no good would be gained; and I confess that in the remarks of the majority of speakers I was disappointed, for I could discover no rules by which they were guided in the particular case, nor any directions that others could follow. Hence it was I dwelt more lengthily on the states which do or do not necessitate the employment of the forceps, the fœtus being still in utero.

But I think you will see in the particulars above-mentioned, and in the general tenour of my remarks, that for years I have done, and still do, recommend the use of the forceps "before the os uteri is fully dilated;" but *how frequently*, depends on the frequency with which the conditions I have stated present themselves to us after certain alternatives I mentioned had failed.

I am, yours, &c.,

J. BRAXTON HICKS, M.D., F.R.S.

George St., Hanover Square, S.W.

Medico-Parliamentary.

HOUSE OF COMMONS.—WEDNESDAY, JULY 30TH.

VACCINATION PROSECUTIONS.

IN reply to Mr. Sejeant Simon, Mr. SCLATER-BOOTH said, I am aware that proceedings have been taken lately against a large number of persons in the Dewsbury union for neglecting to cause their children to be vaccinated, and I fear they may have been encouraged in that course by those who are entrusted with the administration of the law. Proceedings are taken under three heads—1st, for a penalty for neglect to have the child vaccinated; 2nd, there may be a summons to show cause why an order should not be made for the vaccination; and, 3rd, there may be a summons for a penalty for non-compliance with the order. The vaccination officer has written to me, stating that in no single instance has he taken proceedings under the third head against a defaulter previously convicted under the first. That being so, his conduct has not been contrary to the instructions of the Local Government Board, nor to the spirit of the letter to the Evesham guardians. No doubt it is contrary to the resolution of the Dewsbury guardians; but that resolution, as they have been informed, is illegal, and, in fact, a nullity. There seems to me no ground for putting an end to the system of payment of the vaccination officer by fees, which has been generally adopted and works well; nor is it found to encourage prosecutions. The fees are not regulated by the number of prosecutions, but by the number of cases of successful vaccination.

FRIDAY, AUGUST 1ST.

VACCINATION ACTS (IRELAND) AMENDMENT BILL.

Mr. G. BROWNE asked whether it was intended to proceed further with this Bill.

Mr. J. LOWTHER said it was. The Bill would have been brought forward long ago, but for some amendments which had been put down preventing its being taken. If the hon. gentleman would prevail on some of his political friends to withdraw these amendments it would very much facilitate matters.

Medical News.

Royal College of Physicians of London.—The following gentlemen were admitted Fellows of this College on July 31:

Bright, Geo. Chas., M.D. Oxford, Cannes, France.
Sparks, Edward Isaac, M.B. Oxford, Crewkerne.

Admitted Members:—

Lush, William George Vawdrey, M.D. London, Weymouth.
Sharkey, Seymour John, M.B. Oxford, St. Thomas' Hosp., S.E.
Simon, Robert Michael, M.B. Cambridge, Manchester.

The following having passed the required Examinations, received the Licence of the College on July 31:—

Ashe, William Percy, 20 Linden Gardens, W.
Bullock, Charles, St. Bartholomew's Hospital, E.C.
Burwash, Henry John, 144 Kennington Road, S.E.
Chamberlain, Edward Twyford, Southsea.
Coles, Donald Alexander, St. Bartholomew's Hospital, E.C.
Dale, Frederic, York.
Davies, Hugh Edward, University Hospital, W.C.
Evans, Arthur Llewellyn, University Hospital, W.C.
Francis, William, 21 Huntley Street, W.C.
Freeman, William Thomas, Burnham.
Gibbes, Heneage, 28 Oberstein Road, S.W.
Goyder, Charles McIvhor, Infirmary, Newcastle-on-Tyne.
Gurd, David Fraser, 78 Lambeth Road, S.E.
Hassan, Syed 18 Bedford Place, W.C.
Henderson, Cecil, Clifton.
Hill, Charles Birnie, University Hospital, W.C.
Lewis, John George Stephen, 1 Windsor Road, Ealing, W.
Lunn, John Reuben, Children's Hospital, Shadwell, E.
Macdonald, George Alexander, Hull.
McMunn, James, 42 Gower Street, W.C.
Nicholson, James Edward, St. Bartholomew's Hospital, E.C.
Palmer, William Pitt, Ashill, Ilminster.
Patterson, George Henry, Brighton.
Pierson, Alfred Henry, 21 Blessington Road, Lee, S.E.
Price, Edward Morris, 24 York Road, Leamington Park, W.
Sykes, William Ainley, Golcar, Huddersfield.
White, Richard Watts, Guy's Hospital, S.E.

South London School of Chemistry and Pharmacy.—The following prizes were awarded last week at this popular School:—SESSION, 1878-79.—Senior Chemistry (Medal)—Mr. Crook. Senior Chemistry (Certificate)—Mr. Grimble. Junior Chemistry (Medal)—Mr. Roughton. Junior Chemistry (Certificate)—Mr. Parkin. Botany (Medal)—Mr. Sagar. Botany (Certificates)—Messrs. Roughton and Harburn. Materia Medica (Medal)—Mr. Harburn. Materia Medica (Certificate)—Mr. Roughton. Practical Pharmacy and Dispensing (Medal)—Mr. Parkin. Practical Pharmacy and Dispensing (Certificate)—Mr. Roughton.

Royal College of Surgeons of England.—The following gentleman, having passed the required examination for the diploma, received the M.R.C.S. of the College at the meetings

Digitized by Google

of the Court of Examiners on July 24th, 25th, 28th, 29th, and 30th.

Adams, Alexander Peers.
Aske, Wm. Percy, L.R.C.P.Lond.
Baker, William James.
Barling, Harry Gilbert.
Bond, Charles John.

Walton, Robert Spence.
Wray, George Bury.
Yate, Henry Wright.

The Physiology of Saliva.—The action of saliva from the mouth in digestion has lately been studied by Herr Von der Velden. By extraction, with the pump, of numerous samples of gastric juice in various stages of digestive process it was demonstrated that in the first period after taking a meal (three-quarters to one, or even two, hours), free hydrochloric acid did not appear; it was met with only later. Further, it was shown that only so long as the hydrochloric acid continues to be absent, is starch saccharified (iodide of potassium presents only a bright yellow colour); whereas, after occurrence of the hydrochloric acid, the starch remains unaltered (blue colouration). There is, accordingly, a first stage of stomachic digestion, in which alone salivary action can take place; and a second, in which albumen digestion begins, or, at least, arrives, at full intensity.

Doctors in St. Petersburgh.—The entire number of medical practitioners in St. Petersburgh amounts to 743, or a doctor to every 887 inhabitants.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

AN INQUIRER.—Our representative at the Cork meeting will be Dr. Jacob, of Dublin, who will be happy to answer any inquiries.

MR. GANT—Your case of "Epithelioma of Rectum" will appear in our next.

DR. NORMAN KERR is thanked.

DR. J. STEWART.—With pleasure.

AN ESSAYIST.—The French metre is about equal to 3 feet 3 inches, English measurement; the kilometre about 1,093 yards. A millimetre is equal to ·03937079 of a metre, and a centimetre is equal to ·3937079.

A PROVINCIAL.—We understand that Messrs. Fannin & Co. will exhibit several kinds of spray-producers at the Cork meeting; doubtless other instrument makers will do likewise, you will thus have the opportunity of deciding upon the best yourself.

DR. THOMAS is thanked.

MR. W. D. N.—Not by any means expensive.

A CANDIDATE will see the official announcement in our advertising columns, present number.

DR. P.—Translation received, and will be utilised as soon as space permits.

A VICTIM OF QUACKS.—We never prescribe in these columns. The case is perfectly simple and could be readily treated by any qualified practitioner in your town. If you have sufficient courage, by all means prosecute the fellow who has so grossly swindled and deceived you.

EVOLUTIONIST.—The translation of Haeckel's new work on "The Evolution of Man" is published by C. Hegan Paul & Co., 1 Paternoster Square. It will be reviewed before long in these columns.

QUERY.—We cannot give an answer to your question till next week.

BOTANIST.—You will find either Silver's or Oliver's "Manual of Botany" very suitable for the purpose; but we would particularly recommend Otto W. Thome's "Text-book of Structural and Physiological Botany," translated by A. W. Bennett, and published by Longmans & Co.

A VICTIM.—We shall shortly direct our attention to the grievance you complain of.

HISTO.—If you read French, Corneille and Ranvier's Histology is by far the best and most complete histology in any language. There is nothing English to be compared to it.

VACANCIES.

Carmarthen County Asylum.—House Surgeon. Salary, £125. A knowledge of Welsh desirable. Applications to Mr. Howells, 58 King Street, Carmarthen, by Aug. 12.
Carrick-on-Suir Union, Piltown Dispensary.—Medical Officer. Salary, £100, with fees, and £20 as Medical Officer of Health. Election, August 14. (See Advt.)
County Asylum, Bristol.—Assistant Medical Officer. Salary, £100, with board. Applications to the Chairman before Aug. 20.
Sheffield School of Medicine.—Medical Tutor. Salary, £120. Applications, stating qualifications, to the Hon. Sec.
Sheffield General Infirmary.—House Surgeon and Assistant House Surgeon. Salaries, £120 and £80 respectively, with board, &c. Applications to the Medical Staff before August 16.
Shillelagh Union, Hacketstown Dispensary.—Medical Officer. Salary, £100, with fees, and £16 as Officer of Health. Election, Aug. 14.
West Riding Asylum, Wakefield.—Clinical Assistant. Board, but no salary. Applications to Dr. Herbert Major, at the Asylum.

APPOINTMENTS.

CALDWELL, S., L.K.Q.C.P.I., L.R.C.S.I., Certifying Factory Surgeon for the District of Virginia, co. Cavan.
CLARK, J. G., M.R.C.S., House Surgeon to the London Hospital.
CROCKER, H. R., M.D., M.R.C.P.L., Physician to the Skin Department of the University College Hospital.
CUMMING, G. W. H., L.R.C.P.Ed., House Surgeon to the West London Hospital.
MURPHY, J. J., L.R.C.P.Edin., L.R.C.S.Edin., Medical Office to the Irish Mercantile Clerk's Association, Dublin.
O'FARRELL, H., M.D., F.R.C.S.I., Certifying Factory Surgeon for the District of Boyle, co. Roscommon.
OWEN, R., L.R.C.P.Ed., L.R.C.S.Ed., House Surgeon to the County and Brecon General Infirmary.
PEACOCK, H. G., L.R.C.P.Ed., M.R.C.S.E., Assistant Medical Officer to the Dorsetshire Lunatic Asylum, near Dorchester.
POTTS, E., M.R.C.S., Assistant Surgeon to the Gateshead Dispensary.
WILSON, A. F., M.R.C.S.E., Medical Officer for the Dunchurch District of the Rugby Union.

Births.

BATTERBURY.—On July 31, at Berkhampstead, the wife of R. L. Batterbury, M.B.Lond., of a son.
MURPHY.—On July 30, at 18 Harcourt Street, Dublin, the wife of J. J. Murphy, L.R.C.P.Edin., of a son.

Marriages.

NORTON—ADAMS.—On July 30, at Earshan Church, Norfolk, R. R. Norton, M.R.C.S., L.R.C.P., of Tottenham, to Lucie, second daughter of E. B. Adams, of Bungay, Suffolk.
WOODHOUSE—HOLBROOK.—On July 29, at St. Peter's Church, Dublin, Stewart Woodhouse, M.A., M.D., to Charlotte, widow of the late Thos. Holbrook, C.E., Clontarf, and fourth daughter of the late Isaac Corry, J.P., D.L., Abbey Yard, Newry, co. Down.

Deaths.

FAIRCLOTH.—On July 21, at Northampton, John Faircloth, M.D., Senior Physician to the Northampton General Infirmary.
GOSS.—On July 14, at Heavitree, Exeter, James Goss, M.R.C.S.E., formerly of Bishopsteignton, aged 78.
KAYE.—On July 22, at Stand Lane, Radcliffe, Lancashire, Ralph Holt Kaye, M.R.C.S.E., aged 72.
MOULD.—On July 28, at Plymstock, Devon, William Pattison Mould, M.R.C.S.E.
OSMOND.—On July 25, at Thorpe-le-Soken, Essex, Thomas Osmond, M.R.C.S.E., aged 37.
RIGBY.—On July 24, at North Road, Preston, John Rigby, M.R.C.S., aged about 50.
WEBER.—On July 30, at Green Street, London, S., C. A. Weber, B.A., B.Sc., son of Dr. F. Weber, aged 25.

PRESIDENT'S ADDRESS

DELIVERED AT

THE FORTY-SEVENTH ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION.

Held in CORK, August 5th, 6th, 7th, and 8th, 1879.

BY

DENIS CHARLES O'CONNOR, A.B., M.B.,

Professor of the Practice of Medicine in Queen's College, Cork.

MY PROFESSIONAL BRETHREN, MEMBERS OF THE BRITISH MEDICAL ASSOCIATION,—I wish I could in suitable terms convey to you my deep sense of gratitude for the honour you have conferred on me by electing me to be your President. The gratification which I should feel on receiving this honour is, however, associated with a consciousness of my demerits, contrasting myself with the distinguished men who have filled this chair up to its latest occupant, Dr. Falconer, whose urbanity, courtesy, and high professional rank, largely contributed to the success of last year's meeting at Bath; but, above all, when I remember that the last and only meeting in this country was presided over by Dr. Stokes, whose name is fresh in the memory of every Irish physician, whose talents shed a lustre on his profession and country, and whose virtues—simplicity, truth, and honour—made him the idol of all those who had the happiness of his acquaintance. As I cannot deceive myself with the belief that I owe this elevation to superior learning or professional eminence, you, perhaps, give me credit for qualities of a less elevated character, which would enable me to represent worthily the dignity and decorum which will be sure to characterise your proceedings. The keystone of an arch is an important part of the structure, solely because by its position it establishes an equilibrium between opposing forces. The chairman of a meeting exhibits a similar passive resistance, in moderating the expression of contradictory opinions and preserving the calm necessary for the discussion of great subjects.

Of one thing I am certain that, whatever defects or errors may be seen in the execution of my official duties, they will meet with a favourable construction—more especially from the most distinguished members of my profession. The most charitable critics are those who themselves are beyond the reach of criticism.

Some of my predecessors in this chair, on occasions like the present, thought well of pointing out circumstances of interest associated with the locality of the meeting. In a few brief words, I will follow their example. Though you have not come hither for æsthetic enjoyment, still, the surroundings of Cork, which Spenser called the "beautiful citie," must attract your pleasurable notice on every side. This, added to the mildness of the climate, makes the vicinity of Cork an agreeable as well as valuable winter health resort. In this character it is associated with Queenstown and Glengarriff, which has recently acquired a high repute. The sanitary condition of the city is exemplified by the low death-rate, and the gradual disappearance of typhus, which in the last century appeared every seven years; in the early part of this century, every ten years; and now, since the famine fever, we have had but one outbreak of any severity, and that nearly fifteen years since. We owe this to the admirable supply of pure water, and to an extensive system of sewerage, provided by the Corporation. I am far from saying that there is not still much to be done by the sanitary authorities. Pure air and pure water are not useful solely in preventing epidemics; they are also necessary for the preservation of a general healthy condition of the system.

It might not be without interest to mention that, a few paces from where this meeting is being held, stood Gill Abbey, one of those collegiate monasteries so famous in this country in the eighth and ninth centuries, to which, according to Camden and Venerable Bede, "the gentry of England flocked as to a mart of learning," and "which sent forth swarms of holy men all over Europe, spreading learning and religion." We see some resemblance to that happy period in this meeting, when Englishmen come hither to repay, with great interest, any literary indebtedness their ancestors might have incurred. I do not refer to this oasis in Irish history, as families in re-

Digitized by Google

duced circumstances display the portraits of distinguished progenitors, but rather to stimulate the present generation to imitate their great ancestors, and, like them, to seek distinction for themselves and their country in the practice of virtue and the cultivation of learning. Though entering late in the race of civilisation, if we take this city as affording an example of the general result, we will be found to have made rapid advances in a short time. Many years of this century had passed before any arrangements were made for the education of the poor, especially of the male sex. Now, nine thousand children are receiving gratuitous education—in some instances of the highest order. It may be paradoxical, but it is true, that in these instances it is better than could be obtained for any amount of payment. It is creditable to this city that it freely taxes itself for the support of a School of Design; and that it is the only city, as I understand, that pays a tax for the support of a Musical Academy. It has contributed a few distinguished names to the roll of British artists, in James Barry, Macalise, and Hogan; and to literature, in Magin, Father Prout (Mahony), and Justin McCarthy; and to both, a large number whose reputation is not so widely known. In sympathy with the poor—the highest function of civilisation—it will be found that ample progress has been made in this city. Within a very few years, ten different asylums have been established—for orphans, for the aged, or those who have strayed outside the confines of morality in early life. Five new hospitals have been opened, in addition to those already in existence. This has emanated, not from humanitarianism nor from utilitarianism, but from the spontaneous outpouring of christian charity. I make no distinction between different religious denominations. Happily the barriers that separated these have been removed, and, seeing each other from a nearer point of view, men have found good citizenship and brotherly love where they expected to meet aversion and hostility. The same good feeling has been manifested of late in the courtesy shown towards each other by the different sections of the Corporation; and may we not believe that it is owing to such teaching and example from the affluent, that serious crime is almost unknown in this city; and that, for more than half a century, no High Sheriff was under the necessity of carrying out the extreme penalty of the law within this borough?

Having, I fear at too great length, referred to the physical aspect of the city which you have honoured with this visit, and to the social and moral condition of its inhabitants, as they appear to me, I must proceed to make some observations on the composition and objects of this Association, which must appear trite to all but the most junior members or such of the public as take an interest in our proceedings.

When several thousand men, many of them the most distinguished and honoured in their profession for genius and learning, are banded together for one common object, we may readily assume that object to be large, comprehensive, and benevolent; and what purpose of greater magnitude can occupy the human mind or stir the human heart than the effort to lighten the burden of sickness and misery, and to defer the inevitable death in which we all have a common inheritance? In forwarding this work we follow the instincts as men, obey our duty as physicians, and receive a divine sanction as Christians. It can then be well understood how so many, leaving their homes, crossing the seas or ocean, have come hither to unite in this common brotherhood of benevolence. I only hope that the success of this meeting, by increasing our knowledge and diffusing throughoutthe entire medical community sound principles to guide our practice, may be the reward of their sacrifices.

A hasty survey of the composition of this Association, the brilliant genius of many of its members, and their continuous labours from year to year, would lead to a feeling of disappointment that greater results have not followed, which would place medical doctrines on a firm lasting basis, rendering them free from doubt or controversy. This mode of thinking arises from comparing medicine with the physical sciences, in which all phenomena may be traced to a few general principles. Such complete generalisation is not to be expected in the science of vital phenomena, with such multitudinous details, varying under the influence of an equal number of circumstances. Still, to this end have been directed all our labours, hitherto attended with ever-increasing approximation. We are not to reject what is useful because of the garb in which it is presented to us. Even in physical science isolated facts were availed of for the benefit of mankind when the theories which explained them were still erroneous. Sailors could navigate their ships before the time of Copernicus, and the movements of the heavenly bodies were understood before Newton explained the cause, while the manner in which this cause acts is still a mystery, and the greatest mathematicians lament the shortcomings of their most accurate science. All knowledge appears to be but a fragment of truths beyond our reach. It is so with medicine. We can learn from sacred scripture as well as from Homer, the estimation in which our profession was held from the earliest dawn of civilisation. If we had no other guide but the works of Hippocrates, our art would still be a great boon to mankind. The discoveries of Harvey, Jenner, Hunter, and Laennec, have each after the other added to our stock of knowledge, but did not efface what had previously existed. We are here to follow in their footsteps with the light they have shed on our path, and with aids to the investigation of physiological and pathological phenomena which they did not possess. A new point of departure has taken place in the application of the microscope to ascertain the minute structure of organs, and the changes made in them by diseases, which has already produced splendid results. It need not, however, be feared that you will not have a sufficient scope for your labours, when the origination and transmission of nervous power is still undiscovered. The limited nature of our powers of observation and the vastness of the fields for discovery will for ever furnish fresh objects to stimulate the human mind and preserve it from stagnation, which is equally destructive of mental and of physical energy. If thus mental activity find stimulants to its energies in the cultivation of other sciences, how much more should it be in medicine, which may be called the science of sciences, not alone from the importance of its aims, but because every branch of natural knowledge is made auxiliary to its development, whilst the boundaries between physics and physiology are every day disappearing, until the latter has become almost a branch of the former—its laws arranged with supreme wisdom for the production of vital phenomena. When the subjects to be investigated are so many and so diversified, we can see the necessity of such an assemblage as the present of men with minds equally diversified in character, each fitted to develope some particular branch of knowledge, and all uniting like converging rays of light, to illuminate the path of the practical physician. In this the economy of a division of labour is perceptible in nature's design as in the ordinary affairs of life.

Some there are who are destined by their nature to increase the stock of human knowledge. Uninfluenced by self-interest or personal ambition, seeking no other reward but the gratification of an instinct, fed by a hope of ultimate success, not disheartened by failures or by adverse criticism, they labour onward till through the darkness a light is seen breaking, which reveals to their receptive minds, as an established truth, that which was before an unsettled theory or a happy conjecture, and clearing away difficulties which for ages disturbed the minds of medical inquirers. In all the great centres of thought, though divided by space, still united for a common object, such men have by their joint labours within the last half-

Digitized by Google

century, raised a solid superstructure of physiological and pathological knowledge which has all the characteristics of a true science. The briefest reference to the subjects which have been undergoing investigation by members of this Association since its last meeting (embracing the most important and abstruce problems in medicine) would show that they are imbued with the same disinterested zeal, and filled with the same lofty ambition as those to whom I have referred. They do not, however, constitute a large section of this Association, and would not of any similar assembly. *Non omnia possumus omnes*—we cannot all do all things, but everyone can do something towards the common object. For the practical man—the everyday working physician—there is presented the important duty of collecting facts from which the man of genius will derive general principles, and thus assist in bridging over the large space which divides physiology and pathology from practical medicine. To make a good syllogism with physiology and pathology, as major and minor premisses, and the treatment of disease as the conclusion, remains still the difficulty to remove which all our energies are directed. Theories founded on imperfect generalisation cannot be adopted in medicine with as little injury as in other sciences. It is of no consequence to the student of optics whether the undulatory theory of light be true or false, or to the astronomer whether the Copernican system is capable of mathematical demonstration; but it is of great moment to the physician as to whether alcohol is a food or merely a stimulant—whether it is entirely or in part, or not at all, consumed in the body; and still contradictory statements of this kind have been propounded for the last twenty years in succession, each professedly founded on experiments. In this instance, as in many others, error passes by a species of exosmose to the general public, who adopt the views most agreeable to the senses, believing alcohol to be indispensable for the cure of all diseases, and for sustaining bodily health and mental energy. Happily the timely declaration of two hundred and sixty of the most eminent London physicians—which might be printed in letters of gold—has placed the question on its true basis, stating that, "while unable to abandon the use of alcohol in *some* diseases, no medical practitioner should prescribe it without a sense of grave responsibility, and with as much care as any powerful drug."

This and several other instances show that, although practical men should bow to the declarations of science, they should hesitate before accepting unfinished generalisations, which a fresh experiment or a newly ascertained fact might destroy. Even deductions derived from experiments on animals, to test the effects of medicines on the living organism, though of great value, must be received with a certain amount of caution—justified by the fact that certain deadly poisons for man are nutritive food to some animals; that zymotic diseases are not intercommunicable between men and animals, or rarely so; and that even age and idiosyncrasies modify the effects of medicines, so as to make it uncertain as to what may be the effects of a given medicine in one case when we see its effects in another. Add to this the unnatural condition in which the animal experimented on is placed. How modestly, and at the same time philosophically, does Dr. Rutherford express himself on this subject. After "fourteen hundred hours of hard labour," spent in his investigation, he says, "the experiment on the healthy liver of the dog, on the normal and abnormal human liver, are three sets of experiments closely related, but still distinct. The facts derived from any one of the three cannot be substituted for either of the other two. Each set of facts has its own proper place, and must be kept there." And then he advises the clinical observer to test in his practice the deductions derived from experiments on animals. We can thus see that, in the deliberations which will take place in the sectional meetings, there is a place for the purely practical as well as for the scientific man. Their views test and are tested by each other. Rationalism enlightens empiricism, and enlightened empiricism is a check—a drag-chain—on hasty theorising, from which medicine suffered so much injury through its whole history. Much as science has accomplished in establishing the physiological action of many medicines previously used empirically, the practical physician must still in most cases be guided by the results of the combined experience of wise men, free from egotism, vanity, self-interest, or other passions which cloud the judgment and prejudice its conclusions—while always hoping for and striving after a full knowledge of the relation between the medicine and its physiological effects. There are many diseases entirely under the control of medicines, others only partially and indirectly, and a third class, zymotic diseases, in which we can only apply our treatment to the cure of symptoms and regulation of functions, leaving to Nature the task of bringing the disease to a favourable issue. I believe that all attempts to cut short these diseases are fruitless or injurious.

In the early part of this century a different opinion prevailed, and attempts were made to arrest fever by strong purgatives and bleeding. This violent treatment was soon discontinued, but I cannot help thinking that there are again signs of a return to the old heroic treatment, when, in a work of the highest repute, I find it recommended to begin the treatment of typhoid fever with four doses of calomel, of eight grains each, six cold baths in twenty-four hours, twenty-seven to forty-five grains of quinine, to be given frequently in the course of the disease, and twenty-two grains of digitalis as an ordinary dose. We walk in darkness with a slow and cautious step; but here, where we are utterly ignorant of the processes by which the poison is eliminated from the system, we are recommended to give medicines which would test the constitution of one in perfect health. This treatment, though recommended by deservedly high authority, has not as yet found favour in this country, where confidence in the curative powers of Nature in this class of disease still prevails. When we see the care with which each bodily organ is protected, and the wisdom with which the functions are regulated for the preservation of life, we cannot believe that Creative power which arranged those things so wisely would send the finished work adrift to combat with destructive forces without prearrangement for reparation in case of injury, internal as well as external, in fever as well as in fractured limbs, or in union by the first intention. The physiology of health is not more wonderful than what may be called the physiology of disease, by which disturbed functions are restored to their normal condition. It is not a humiliating office for the physician to study the means by which Nature accomplishes her ends, and, as far as his knowledge permits, to imitate her. I know the assertion of a *vis medicatrix naturæ* is now nearly obsolete, and equally so the seeking of primary causes for vital phenomena. These old-fashioned ideas have been extinguished by modern philosophy, which asserts that all organisation and its operations are the result of blind chance, without a mind to fashion or to guide them. The physician, with his opportunities for observation, must be blind indeed who does not see beyond this darkness a clear light, showing him that all Nature has been conceived and formed in beauty and order, the result of a divine purpose, directed by divine benevolence.

Whatever differences there may be in the expression of our views about treatment, or whatever disputes about theories, when we meet disease in a concrete form, in a fellow-man appealing to us for help, minor distinctions disappear, and we find we have been differing in words, not in substance; and as happens in cities, from frequent consultations, there is a levelling of extreme views, and an unwritten practice of medicine becomes established. The chaff is scattered to the winds, and solid truth remains. "*Opinionum commenta delet dies; naturæ judicia confirmat.*"

Whatever drawback the physician might feel on the pride and satisfaction which ought to attend the practice

Digitized by Google

of his profession, there is none from the study of Hygiene and the enforcement of its principles on governments, corporations, and the general public. Here he is the more than disinterested servant of humanity, elevated far above the ordinary pursuits of professional life. Much has been accomplished by legislation since Jenner reversed the sentence of death or deformity pronounced against millions of the human race, removing the dark shadow that hung over every cradle. Still this great science is only in its infancy, and must ultimately sweep from the nosology most preventable diseases. A most important branch of this subject—"Personal Hygiene"—is not influenced by legislation, each individual having the power of obeying or violating its laws, at his discretion—guided on the one hand by his intellectual and moral faculties, and on the other yielding to the cravings of his animal nature; the one tending to elevate, the other to depress and degrade, by subjecting the will to sensual gratifications and emotional instincts. The physician, in his private consultations, is the lawgiver in these cases; and never does his profession afford him greater power of doing good, by enabling him to give advice to each patient as to the food suitable to his age, occupation, and circumstances in life, as to the danger of luxurious living, and the deceitfulness of the senses, ever craving what is pleasing instead of what is useful: above all, by counselling extreme moderation in the use of stimulants, if they should be required at all. And when we find how weak a man's nature is to resist animal enjoyments, particularly the weakly, the miserable, and the poor, who are willing to purchase an hour's exultation of their depressed spirits at the cost of many hours' misery; and how impossible it is to stop the downward course (*facilis descensus*) once begun; we will find many to whom we may advise absolute restraint, and thus counteract the vitiated opinion which prevails amongst the public, that stimulants are useful in every form of disease—every derangement of health—which they commence to use as a cure, and continue as a poison. I cannot avoid speaking strongly on this subject, knowing the widespread destruction resulting from these erroneous views.

Having referred "feebly, I fear, and only in obedience to official custom," to some of the objects of the Association, I must conclude with a few remarks on the influence these meetings are calculated to produce on the personal and professional character of its members. It must stimulate the industry of each of us to see men from the remote corners of the earth, of different nationalities, speaking different languages, assembling, ready to lay down their prejudices, if any exist, or offer up any increase of knowledge they may have attained, at the common altar of science, in order that through all civilised nations there may be a uniformity of opinion and practice. The old man, no longer "*laudator temporis acti, castigator censorque minorum*," enters into free discussion with his younger brethren, claiming no consideration except what may be conceded to his knowledge. Perhaps his slowness to adopt new views, or unwillingness to discard old opinions any more than old friends, may temper the heat of the youthful mind which Horace, the Shakespeare of antiquity, describes thus: "*Colligit ac ponit temere et mutatur in horas*," each mind being thus the complement of the other; nothing is adopted merely because it is new, and nothing rejected for being old. The physician whose name has already reached the temple of fame, to be its permanent inhabitant, comes hither to have his opinions tested by the humblest member of the profession; and thus many, who have hitherto been contented with routine knowledge, will be stimulated to enter on a renewed course of study. We should always feel that, though receiving no supernatural mission, we have assumed responsibilities that attach to no other calling. We profess to be ready, night and day, to meet all emergencies. In the army, the officer when on duty is punished doubly for any offence or negligence committed; but the physician is always on duty, ever in actual combat: the enemies being disease and death. In years gone by, the physician asserted the specialty of his calling by pretentious peculiarity of dress. This generation does not tolerate class distinctions of this nature. By levelling up and levelling down, the gentleman and his groom, the young lady and her brother, have become very much alike. Still there is a dignity without pomp, a dignity associated with humility and simplicity of character, which the physician should possess, making him ever feel that society and his profession have a claim on his conduct and actions. His ministrations to the poor, in dispensaries and hospitals, if he would only spiritualise his motives, would raise him to the highest dignity attainable by humanity.

To show the estimation in which our profession is held by many outside of it, I will quote a few words from an English divine, Father Faber. Writing of St. Luke as a physician and painter, he says: "There is something kindred in the spirit of two occupations. The quick eye, the observant gentleness, the appreciation of character, the genial spirit, minute attentiveness and sympathising heart, the impressionableness to all that is soft and winning, weak and piteous—all these things belong to the true physician. He is the minister of love, not of fear, vested with a sympathetic office of consolation, which seems the more tender and unselfish because it is official." Few there are who could claim this portrait as their own. Still all should labour towards this ideal, however exalted. Unless the heart be kept warm by sympathy, familiarity with suffering will make it hardened; and the physician becomes a skilful machine, deprived of all moral enjoyment in his actions. Never could it be more necessary that our minds should be pure, and our motives exalted, than when entering on the work of this Association. There is something solemn in the deliberations of large assemblies, which, like the force of gravity, attract individual opinions as to a common centre—rendering it all the more necessary that unalloyed truth, wisdom, and benevolence should characterise our proceedings. And, returning to your homes, this meeting may be ever associated in your minds with a recollection of duties conscientiously discharged; of the friendship of early life restored, and of new ones formed on mutual respect, similarity of tastes and pursuits; and of renewed devotion to the advancement of our great profession and the welfare of its members.

Allow me, before I conclude, to avail of this the first opportunity presented to me to express, on behalf of the profession in this city, our pride and satisfaction at the alacrity with which our fellow-citizens have come forward, in spite of adverse circumstances, to do honour to this Association on their arrival amongst them. In acting thus, they will transmit to a future generation the character for hospitality and respect for the stranger inherited from their ancestors. You have only to look through the College, at the excellent arrangements made for holding the various meetings, to know that there is another person eminently deserving of our gratitude, namely, the President of the Queen's College, who has never ceased, by counsel and by action, to aid us in the preparations for this meeting, as he does in every movement calculated to benefit his fellow-citizens. How can I speak, without apparent exaggeration, of the exertions of Professor Jones in promoting the arrangements necessary for the success of this meeting? When he first proposed inviting the Association to Cork, I was nervous and alarmed at the magnitude of the undertaking; but I soon became aware that he made no miscalculation, and that he was able to realise his original promises by unceasing energy, tact, and thorough knowledge of the subject. He was not only the first to suggest the invitation to Cork, but the first to form a local Branch in Ireland, thus establishing a cordial union between the members of our profession in the two great divisions of the empire. For myself, I have to express to him my warmest thanks for saving me much trouble and anxiety; and I am sure I can express the same feeling on behalf of every member of the profession—Honour to whom honour is due.

AN ADDRESS DELIVERED AT THE OPENING OF THE SECTION OF MEDICINE,

At the Annual Meeting of the British Medical Association, in Cork, August, 1879.

By ANDREW CLARK, M.D., F.R.C.P.,
Physician to the London Hospital; President of the Section.

MEDICAL EDUCATION—PRESENT STATE OF THERAPEUTICS — PROSPECTS OF EXPERIMENTAL INQUIRY.

It has been the practice of the previous occupants of this chair to open the proceedings of the Section by a general address. Usage has transfigured this practice into a rule, and now with very limited time at our disposal and important subjects pressing for discussion and promising in manifold ways to repay it, I am constrained by the forces of custom and expectation to make sacrifice of some precious time at the shrine of this Procrustean tyranny.

When I examine the addresses of my predecessors, I find them occupied in setting forth the dignity of medicine, the greatness of her achievements, her increasing services to mankind, the spirit in which she is to be cultivated, and the self-sacrifice demanded of her cultivators. They are all stately hymns of praise. There is not in one of them a hint of imperfection or a thought of wrong. What completion, what perfection, what greatness has this medicine? How good a thing it is to be numbered, however humbly, in her ranks! There we can rejoice in the thoughts of the furthering of knowledge and in the doing of good. There our satisfactions need have no checks from doubts, from reproaches, or from fears. There is our Utopia. Come let us extol and give thanks.

And who, understanding the difficulties, the responsibilities, and the anxieties of medicine, who knowing her toils, her sacrifices, her triumphs, and her meagre rewards, would grudge her liberal tributes of grateful praise? No one with any pretensions to a just and generous mind. Surely not I. As her merits are beyond measurement, so let her praise be without stint. But there is another side to considerations of this kind, and it may not be forgotten without serious peril. Medicine cannot stand still. Changes go on within her, changes inseparable from her history go on around her, and they are not always either parallel or congruous. And yet, if medicine is to advance, they must be continuously re-adjusted and harmonised; left unadjusted from blindness, from indolence, or from calculations of self-interest, medicine must decline. Nothing in this matter contributes more to imperfect vision as well as to imperfect action than self-satisfaction. In professions, in individuals, and in peoples alike it is an obstacle to progress and a prelude to decay. He, therefore, who truly loves his profession will not fail to warn her of this peril, to remind her that she has defects to make good and errors to correct, and to show her that in the pursuit of an ever-widening ideal alone can she find the fulness of her knowledge and strength of her larger uses to the race and of her just honour among men.

In the medicine of these days, there are many topics, both of polity and of practice, which urgently demand and would amply repay the fullest consideration and discussion. But on the present occasion neither will time nor circumstances permit the free handling of even one of them. I must content myself with merely touching upon a few of the more important, and with hoping that I may excite in minds abler than my own such an interest in their further consideration as will lead to their juster settlement.

There are three questions upon which I desire to offer reflections. They are the questions of medical education, of the present state of therapeutics, and of the prospects in this country of experimental inquiry.

Now, as respects this question of medical education, it seems to me to be in a gravely unsatisfactory condition, and to require the immediate and earnest attention of the profession. Jostled on the one side by quackery, and on the other by science, it is failing in its true work of training students to be sound practitioners of the art of medicine. Medicine is an art, and its end is practice, and the worth or worthlessness of any system of education must be tried by the degree in which it helps or hinders this end.

Tried by this test, the present system of medical education is, for the following, among other, reasons, found wanting:—

1. That, whilst it has added to the curriculum and enlarged the range of examination, it has left the time for study the same. This is destructive of that thoroughness in learning which should be a prime object in education.

2. It has introduced into the curriculum, or it has left in it, subjects difficult to acquire, worthless as mental gymnastics, useless in practice, and speedily forgotten when acquired.

3. It makes no sufficient separation between the various stages of medical education; it permits the one to interfere with the other—the lowest with the highest, so that when the student should be in the wards studying disease and the effects of remedies, he is somewhere else committing to memory botanical characters of plants or the complex formulæ of chemical compounds.

4. It does not enforce the regular attendance of students in the wards; it does not require them to take a personal share in the clinical work; and it does not insist upon a period of unencumbered practical study sufficient for the acquisition of that knowledge of disease and remedy which should never fail upon an emergency and be always ready for immediate use.

5. Its examinations are so constructed, or have acquired such a construction, that they determine the nature, character, and extent of the previous instruction, and that the student when he has passed them finds himself in possession of knowledge which he does not need, and lacking that which he should have acquired in the wards, and which, now leaving the hospital, he cannot afterwards obtain. Almost no future industry and almost no experience in private practice will ever fully compensate for defective clinical study and training in the hospital wards, when the mind is plastic, and the student learns disease as a child learns speech.

6. It sanctions imperfect and even vicious methods of teaching. The student is told, not taught. The teacher describes rather than demonstrates; and, instead of making the student follow him step by step in his methods of observing, collecting, comparing, testing, and recording facts, and of reasoning thereon, the teacher leaves them to be learned by being described, forgetful that they can be learned only by being practised.

7. Careless of the manner in which knowledge is acquired, and sceptical as to the permanent educational value of discipline, training, and habit, it makes examination the test of fitness, the answering of questions at intermittent periods an adequate guarantee of continuous practical work.

8. The main tendency, then, of the present scheme of medical education is to give students smatterings of scientific knowledge at the cost of that thorough knowledge of their art which is essential to its successful exercise.

It will, doubtless, be objected to any scheme proposed for remedying the defects and correcting the errors of the present system that it will injuriously restrict the limits and degrade the character of medical education, and that it will hinder rather than help the development of scientific as opposed to empirical methods of inquiry. But such objections spring from misapprehension of the aims and end of science. Science is not a subject; it is not an object. It is merely a regulated method of inquiry in a certain attitude of mind into relative truth and its conditions, and is the same in its nature and its uses, whether dealing with the problems presented by sickness in man, or with the problems presented by catastrophes in the crust of the earth.

There is a cant in science as well as in religion, and both are alike base and baleful. Surely nothing can be more unscientific than discursive dabblings in many subjects. Nothing can be more scientific than the training of the mind to habits of minute, careful, and methodised observation and registration of the phenomena of disease. Nothing is more ignoble than ignorance of the calling which we profess to know and are trusted to exercise. I, for my part, shall continue to believe that the physician, in investigating the phenomena of disease, and the laws which regulate their association, succession, and issues, may be as truly scientific, and may become as highly cultured, as any chemist in speculating upon the constitution of organic

Digitized by Google

radicals, or any astronomer in calculating the times and distances of unknown stars, or any natural philosopher who, from his inquiries into matter and force, propounds conclusions opposed to the ineradicable instincts of the human race.

I turn now for a few moments to the second question upon which I proposed to touch—that is, the present state of therapeutics.

When, but a little while ago, Sir William Hamilton asked quite seriously if the practice of medicine had made a single step in advance since the time of Hippocrates; when we hear that the leaders of medicine both here and abroad are sceptical of the curative influence of drugs upon disease; and when we know that experienced practitioners are divided in opinion as to the effects upon the body of the commonest medicines, we cannot doubt that this, the highest department of our art, and one of its chief ends, is in a backward and unsatisfactory condition, and demands, like the question of education, the serious consideration and action of the profession. Beyond the inherent difficulties of the subject, which are undoubtedly many and great, the reasons of this lie near at hand, and are not difficult to discover.

In the first place, although there are many and excellent books on the actions and uses of drugs, there does not exist, as far as I know, with one exception, any treatise on therapeutics in the full sense of that term; neither do I know of any physician of experience and authority who teaches the subject. What is taught in the schools is materia medica; and it is taught at a period in medical education when the knowledge of the natural history of diseases, which is the fundamental starting-point of therapeutics, and the true criterion of therapeutical success, is almost a blank. Of some forms of acute disease—of pneumonia, for example—we have trustworthy and almost sufficient knowledge; but of the natural history of most chronic diseases; of their course from first to last; of the modes in which the organism, uninfluenced by drugs, and favoured only by the conditions of health, deals with these maladies in their origin, in their modes of progression, in their influence upon other parts, and in their issues either in recovery or in death—we know almost nothing, and certainly not enough for the commonest purposes of the therapeutic art.

In the third place, we have no trustworthy knowledge, and therefore no distinctive teachings, of the respective provinces and powers of nature and of art in bringing about recovery from disease.

In the fourth place, we have to exact information as to the conditions in which, when Nature unaided fails to bring about recovery, we may employ the known physiological properties of drugs with any sure prospect of success. This is the province of physiologal therapeutics, and in whatever quarter or from whatever point of view we examine it, there appears the richest promise of future discovery.

In phthisical patients attacked with bronchitis there is a condition of the bronchial mucous membrane fraught with peril not only to the lung, but to the life of the patient. The membrane is congested, swollen, dry, and coated with a thin, but tenacious and irritating, secretion. This condition may continue for days, producing fever and paroxysms of ineffectual coughing, which exhausts the strength of the patient, and puts him in peril of hæmorrhage. In ordinary cases nature brings about relief by free secretion from the affected membrane. In the cases under consideration, nature fails, and the problem is, how to induce this stage of free secretion, which our knowledge of the natural history of the malady assures us will bring speedy relief and safety to the patient. Here becomes available our knowledge of the physiological properties of drugs. There are several that will excite free secretion from the bronchial mucous membrane. There are, for example, ipecacuan and antimony. The latter is the better, and if we give a twenty-fifth of a grain of it every hour, the mucous membrane, after a dozen doses, will begin to secrete, the patient's cough will become looser, and he will cease from suffering and from peril.

In the fifth place, we have no accurate account of the phenomena, physiological, pathological, or chemical, which accompany the administration of remedies, the effects of which are in some degree certain, but the modes of action of which are utterly unknown. This is the province of empirical therapeutics, and one which would have speedily enlarged but for the checks which unhappily have been put upon experimental investigation by the hysterical clamour of sickly-minded humanitarians.

In the sixth place, there exists an assumption which, in any general sense, is at once unproved and doubtful, that the physiological effects of drugs upon living textures or organs in a state of health are identical with the effects of the same drugs upon textures or organs in a state, and in almost any state, of disease.

In the seventh place, there is the almost absolute neglect of any comprehensive and connected cultivation of animal chemistry in its relation to pathological and therapeutic processes. And yet it is certain that chemical changes accompany, if they do not determine, the genesis, growth, development, retrogression, and recovery, not only of every pathological condition. Nor is it improbable that chemical changes due to chemical errors are the initiative and constituent factors of many diseases. Indeed, the problems presented by diabetes, acidity, liathiasis, oxaluria, gout, rheumatism, intra-vascular blood-clotting (inopexia), and fevers, require for their solution but a slight advance of our knowledge of the chemistry of nutritive metamorphosis. In rickets it has been found that the bones and the tissues immediately investing them contain lactic acid; and it has been supposed, with some show of probability, that it is to the solvent action of this substance that the disappearance of mineral matters from the rachitic bone is due.

In the eighth place, there is the strange and fantastic theory, that diseases are immutable, and that the types of morbid action are for ever the same—that out of certain conditions in the early history of the race and its environments, never to recur, diseases arose, were stereotyped, and have retained their primitive characters up to this day.

But to accept such a theory as this would be to make the better part of historical and scientific knowledge impossible, and to cast us back into the ages when observation, experiments, and reason were the slaves of authority and superstition. Undoubtedly there are affections, such as colic and catarrhs, which have been common to man, and which have retained their likeness from his birth until now. This, however, is but a fragment of the truth; and when one comes to examine with a critical understanding the history of the race, and the moral and physical agencies influencing it in its progress through the successive ages of the world, we are forced to admit that diseases have come and gone, that successive epochs have had their characteristic maladies, that different regions of the globe possessed their pathologies as well as their floras, and that the disorders of man took form and character and colour from the changing climates and civilisation in the midst of which he dwelt, and of which, in a cosmical sense, he formed a constituent part.

Indeed, from a theoretical point of view, all this must be so; nay, it is even demonstrable that it is so. Man, in his journey through time, has been witness to the most stupendous terrestial revolutions; the lineaments of the globe have oftentimes changed; seas have taken the place of continents, and continents of seas; races of animals have arisen, have flourished, and have become extinct; arctic cold has been displaced by tropic heats; scorching droughts with endless rains; tribes, and peoples, and nations, with their varying barbarisms and civilisations, have passed across this mighty stage. Change has followed after change upon the earth, until now its physiognomy and its climate have become so transfigured that, if its earlier denizens were to revisit the scene they would no longer recognise it as their primeval dwelling-place.

How then is it possible, in the midst of all these cosmical, terrestial, and human changes, that the disorders and the diseases of man alone should remain unchanged? By what show of facts and arguments can this pathological immutability be explained and vindicated? By none, I think, capable of sustaining a just criticism. But what may be conceded to indefinite duration may be denied to the narrow age in which we live. Geological epochs may count for something in their influences upon the human constitution, but the span of modern civilisation for nothing. This position also, I think, is untenable. We are living at a time, in conditions, and under influences when, with a carefully trained eye, we may see that the human organism is readjusting itself to its progressively-varying environments. The man of to-day is not the man of two hundred years ago. The nervous system, cultivated in every direction, and

Digitized by Google

strained and hurried by an intenser life, has assumed almost new relations to the other parts of the organism, altered the complexion of accustomed diseases, and engendered disordered states unknown to the literature of the past. The syphilis of Jean de Vigo, and even of Collis, is so little like the syphilis of these days that the accuracy, and even the veracity, of those writers might not unwarrantably be questioned. There was a time when it was not, and its later history justifies the hope that a time when it will cease to be. The groups of nervous affections which cluster round an intensified physical self-consciousness were unknown even to Whytt, and yet they constitute a large and growing proportion of the troubles which afflict the more highly cultivated men and women of the present time.

In the increasing duration of the menstrual epoch, in the greater age to which powers of mental work are prolonged, in a slowly-deepening intolerance of alcohol, in the steady growth of our comparatively new sense of the beauties of nature, in the expansion of our capacities for scientific inquiries, and for abstract discussions, in our views of the foundations and force of ethical relationships, and in our perfect tolerance (signalised by some flagrant exceptions) of intellectual and religious freedom, we see evidences that the race is undergoing a constitutional change; and we know that this change must modify the diseases and the treatment of the diseases of mankind.

But I must hurry away from this attractive, although outlying, part of my subject to say, in the ninth place, that another fertile source of failure in therapeutics is the absence of an adequate recognition of the enormous influence exerted upon disease and its treatment by all that is implied in the individuality of the patient—by hereditary temperament, education, habit, the prevailing attitude of mind to the future, and all the circumstances of the higher life. There are few principles in medicine, and, in this sense, it is certainly one among the most unprincipled of arts. Every case is a law to itself, and contains within itself the conditions for its own management. It is the quick perception of these conditions, and the ready and happy use of remedies for their control, which makes skill in therapeutics. Lastly, there lies a serious hindrance to therapeutic progress in a still prevailing looseness of therapeutic investigations, and in a painful want of accuracy in recording the results of these. One cannot review the therapeutic history of the last quarter of a century, without experiencing a feeling of shame, as well as of sorrow, for the pretentious and baseless statements with which it abounds. A few crude and ill-digested experiments upon animals, supplemented by some equally crude and undigested observations on man, tricked out in the phraseology of science, surrounded with much parade, devoid of accuracy, completeness, or strength, make up the substance of many of these scientific investigations; and their conclusions are committed to the profession, in words of sublime audacity, with as much confidence as if they were the conclusions mathematically demonstrable of chemistry and physics. The authors of such statements as those to which I allude are not merely intellectually, they are also morally, deficient; and, if a just criticism lived among us, they would be scourged into becoming silence. We long for the advent of another Socrates, who shall put these sciolists to a pitiless cross-examination, and prove to them out of their own mouths that they have nothing in them of the spirit of science, and know not even the true meaning of the name which they appropriate and desecrate.

And now, with a few more words upon the subject of experimental inquiry, I shall cease to trespass upon your indulgence.

I believe that it is to experiment upon animals, in some shape or another, that we owe the bulk of our recent gains in medicine; and that it is to experiment, aided by practical chemistry and physiology, that we shall have to look hereafter for our most substantial additions to the knowledge both of the nature and of the treatment of disease. "Its importance, indeed, cannot be overrated; for through its help we shall have often to look for the criterion of uncertain doctrines, the solution of unsettled problems, the organisation of fresh inquiries, the annexation of outlying truths, the discovery of unknown facts and laws." (Dr. Andrew Clark's Introductory Address, 1876.)

Undoubtedly experiment has also its other side; and, disregarding its inherent difficulties, which are neither few nor slight, it is beset with dangers which must be watched with a jealous eye and guarded against with a firm hand. By the *prestige* of precision, often unmerited, which they carry with them, experiments sometimes cover the most flagrant errors and give currency to false or inadequate generalisations. Even when every precaution has been taken to secure precision and accuracy in every particular, it cannot safely be inferred that the results of certain experiments upon animals will be identical with those which would happen in man submitted to like conditions. Nor, without other authority, would it be justifiable to use those results in the explanation of physiological, pathological, or therapeutical facts; for, however numerous may be the results of experiment, however important may seem to be their bearing upon the progress of science, they will be of no avail to medicine, and it will not be safe to use them in her service, until they have been filtered through the checks and counterchecks of clinical experience, and have responded to the tests and countertests of clinical trial.

Now, experiments cannot be performed on animals without the infliction of suffering; and we, whose lives are spent in aiming at its relief, ought not to be indifferent to this inevitable and painful fact, nor regardless of the solemn responsibility which its existence imposes upon us. I rejoice to believe that we need not reproach ourselves for this sin; and that, as a body, we have never transgressed the limits set to our inquiries by the order of nature, the exigencies of human suffering, and the sanctions of wise and good men.

Three years ago, a certain section of the public thought otherwise; and, by dint of clamorous outcries against our humanity and the circulation of accusations of cruelty either exaggerated or false, forced the Government into a hasty legislation, which, whilst it permitted the show, sacrificed much of the substance, of freedom in this matter. Since then, although crippled in every limb, inquiry has managed to limp along and to do some useful work. No experimental atrocities have been heard of, and no occasion has arisen to make men and women forget their loyalty to charity, to justice, and to truth. In these circumstances, whilst conforming in good faith to the conditions imposed upon us, we might justly have expected to be left to travel unmolested along our narrow and difficult way. But it is quite otherwise, and I have learned upon undoubted authority that means are being rapidly collected for a fresh crusade, that no quarter is to be given in the coming conflict, and that no peace will be concluded until the liberty of inquiry by experiments upon animals is unconditionally extinguished.

It is hard to understand the reasons of this passionate antagonism, and still harder to believe that it has no other foundation than the desire to protect the lower animals from unnecessary suffering. For, if this be true, why do our antagonists confine their warfare within such narrow limits? The infliction of suffering for ulterior ends everywhere manifest in nature, now adjusting the balance of nations or establishing the anatomies of peoples, pervades the whole structure and relations of civilised life. What is all the suffering inflicted by all the vivisectionists of all the world, in comparison with those hecatombs of suffering which political experimenters have inflicted upon mankind in their vain attempts to settle the question of the balance of power in Europe? Are the sufferings of men of less account than the sufferings of brutes? Is their blood less precious? Are the countless woes of countless human hearts to be reckoned but as dust in the balance against the wounds of guinea-pigs and frogs? Surely the love of knowledge is as pure and true a human desire as the love of sport; and whilst the fruits of this die with the individual and his interests, the fruits of that live for ever in growing uses to the race.

If it be true, then, that we are again in peril of a fresh attack, and that the one object of it is to be the unconditional extinction of experiment upon animals, I trust that we shall not stand idly and timidly by whilst this great evil is being done. I trust that every member of our great profession, and every thoughtful man beyond its pale, will unite to make this cause their own, and will offer to threatenings of fresh legislation such an implacable opposition that the statute-book of England shall never again be sullied by penal enactments against the just liberties of knowledge. The highest heritage of humanity is in our keeping; all the past and all the future conspire to make us loyal to this sacred charge; and, at whatsoever cost, of whatsoever kind, we must hand down the right and the freedom of inquiry unmortgaged to future generations.

And now, having occupied rather more than the sacred quarter of an hour, I shall no longer interpose between you

and the important discussions which are before us. I shall content myself with expressing the hope that, each effacing himself and uniting together for the higher objects of this Association, our deliberations and discussions may issue in some advancement of knowledge and its still wider application to the uses of men.

Clinical Lecture

ON TUBERCULAR DISEASE OF THE TESTES.

By ARTHUR T. NORTON, F.R.C.S.,
Surgeon to, and Lecturer on Surgery at, St. Mary's Hospital.

THE subject of this disease was 33 years of age; a brother and a sister had died of phthisis, and another sister was dying of the same affection. Both testicles enlarged: the right around long diameter, 10 inches; around short diameter, 8½ inches. Left testicle, long, 11½; short, 10 inches.

The right testicle oval, surface smooth, tense, hard and solid, not fluctuant except at upper extremity, veins of surface full. This testicle was kicked by a colt twenty years previously: it was then swollen and painful, and necessitated him keeping his bed for nearly three months; the swelling subsequently subsided to a great extent, but the organ had never resumed its natural size. About ten years later this testicle was again kicked by a horse, on account of which he was laid up for five weeks. About two years before his admission into the hospital it was kicked by a horse for the third time, which compelled him to lay up for ten weeks, and since which time the testicle had retained the size mentioned above.

The *left testicle* had swelled about two years previously as the result of gonorrhœa: the surface veins injected, the lower two-thirds hard, upper one-third fluctuant, in the depth of the fluctuating cavity the structure hard, irregular and nodular. The fluid in this cavity was drawn off, and found to be thin albuminous serum. Both cords were considerably thickened, and also the left vesicula seminalis. I may here state that one testicle was afterwards extirpated by me, and before making remarks upon the symptoms and treatment of the case we may examine the organ removed.

Here is the testicle which has been carefully injected by our Pathologist, Mr. Pepper. About half of the organ is composed of a tissue containing vessels, and is, therefore, red in colour; then there are masses or patches of yellow tissue without any trace of a vessel within them; then there is a large cavity with a thick wall—a cyst, the contents of which was clear serum, containing a large quantity of albumen: this cyst occupies a position about the junction of the epididymis with the body of the testis.

I have now pointed out to you the condition of the patient on his admission, and the condition of the testis shown by examination after removal, but which was completely ascertained by the signs and symptoms before removal.

Diagnosis.—It was not a matter of difficulty to decide that the tumours were in connection with the testes proper, and therefore only those tumours with which the testicle is liable to be affected required consideration. Among these there was sufficient evidence that inflammation was the original cause of the growths—for one testis had been inflamed by injury on three different occasions, and the other had been inflamed as the result of gonorrhœa. The disease might be described as simple sarcocele, or long continued chronic inflammation; but it has been mentioned that several members of the patient's family had been the victims of phthisis, and some surgeons would prefer to call the disease tubercular testis. The examination of the testicle after removal exhibits large masses of yellow substance, to which the name of tubercle might be given, and a microscopical examination of those yellow masses shows chronic inflammation, a light fibrinous matrix with exudation corpuscles, apparently an absence of vessels, and most certainly none of those giant-cells which have been described as typical of tubercle. I think we may learn from an examination of this testicle that the term tubercle is indefinite, and that it is differently understood by different surgeons, and by them employed to express different conditions.

From the family history it may be inferred that this man possessed a tubercular diathesis, if, indeed, such a condition can be said to exist, but it is certain that the tubercular disease of the testes would never have occurred had it not been for the extensive and repeated injuries received, and notwithstanding these injuries twenty years passed away before the disease had made sufficient progress to be of serious inconvenience to the patient. It was no specific constitutional disease which promoted the changes in these testicles. The disease was purely local. The pathological condition found here strengthens me in the opinion that I hold with regard to all cases of so-called surgical tubercle. I refer to the disease of joints, cancellous tissues of bones and glands as in the case before us—that they are all of traumatic origin, or the result of local subacute inflammation due to exposure to cold, or damp; that it is not any special tendency on the part of the individual to develop in any part of his body a particular tissue called tubercle, but that there is in many cases a state of the constitution predisposing to chronic inflammation—a state which may be best described as constitutional debility—a state which varies, from time to time, in the same individual; a state which may come, as for instance after fevers, upon the hitherto strongest of constitutions, remain for a time, and perhaps disappear. Is it possible to say when this state exists in any particular individual? I think not always, for there is no well-marked defining line at which it can be marked off from a state of supreme health. I would rather say we are all of us unexceptionally liable to chronic inflammation, some of us more than others, and so on in grades, to the victims of extreme scrofula.

But I am entering *in extenso* upon the relation which the constitution bears to the causation of local chronic inflammation. Now, on the other hand, can a chronic inflammation arise *in loco* apart from the constitutional condition? I am assuredly certain that such can take place; if any part becomes subacutely inflamed by injury or exposure, and have not the required rest, but is continually harassed by exercise, suppuration or chronic inflammation with its accompanying changes will take place, and if the part affected be one of importance, the constitution will become secondarily affected.

Many such instances occur in the form of traumatic arthritis, traumatic periostitis, with caries, &c.

Having regard to these views I diagnosed the disease to be chronic inflammation of both testicles, with complete destruction of the tubular tissue, and the formation of a large cyst in each testicle.

Prognosis in this case depended upon the destruction of tissue. In chronic inflammation there is infiltration with plastic material, which after remaining for an indefinite period may suppurate and form an abscess, or may become imperfectly organised into a cellulo-fibrous structure, having the least amount of vitality. This new tissue appears to press upon and destroy the normal tissue of the organ, and even to affect the blood-vessels—for, ultimately, scarcely any blood-vessels are to be found within it.

In forming a prognosis it is necessary to know what is the condition of this infiltrating exudation. If it is not yet organised, that is, if it still retains its fluid character, it will take the impress of a finger or thumb pressed slowly but firmly into it, but if, on the contrary, the exudation has assumed the form of a growth, the finger after withdrawal leaves no depression. This method of examination is, I consider, one of the greatest service in detecting the character of a tissue, though it is not referred to in our works on surgery.

Digitized by Google

In neither testicle was there the least give to pressure, but on the contrary irregular nodules of growth could be detected. Further, the length of time over which the diseased changes had been taking place, namely, twenty years in one testicle, and the fact that the vesicula seminalis had become secondarily affected with chronic inflammation, all were evidence that treatment would avail little in reducing the size of the organs, but that they would continue to increase in size, until the formation of an abscess would bring about that condition which we know as hernia or fungous testis.

Treatment.—Having concluded in my own mind that absorption could not be accomplished, the question of operative interference remained to be considered. I, however, determined not to undertake the latter until other remedies had been tried and failed, and I therefore ordered a lotion of iodine (t. iodi, ʒj ; glycerine, ʒij ; ad aquæ, ʒj.) and the organ to be tightly compressed by a bandage. This lotion I use invariably to promote absorption, and recommend it in preference to all other preparations of iodine. It should be applied with oilskin so that no evaporation can take place, and it will be found that one drachm, or even half a drachm to the ounce, is often sufficient to produce vesication. The lotion should be applied of a strength short of producing vesication. After a fair trial of the palliative treatment, the operation of castration was performed, from which the patient made a good recovery.

SIMULATIVE CEREBRO-SPINAL MENINGITIS, WITH ABNORMALLY HIGH TEMPERATURE.

By EDWARD D. O'NEILL, L.R.C.S.I., L.K.Q.C.P.I.

During a voyage in the present year, which I made to China, in medical charge of the *s.s. Deucalion*, touching at Malta, Port Said, Suez, Jeddah, Penang, Singapore, Hong Kong, Shanghai, and Japan, I had an opportunity of seeing examples of morbid states peculiar almost to the inhabitants of these places. The following case I extract from my note-book, as possessing some features of interest.

Abdallah, æt. 34, an Arab interpreter in charge of a number of Mahometans who had been on a pilgrimage to the tomb of Mahomet at Mecca, sent for me on the 3rd of March, 1879, three days after leaving Jeddah, and complained of the following symptoms, viz., pain in the frontal region and back of neck, with retraction of the head ; pains in the calves of the legs and small of the back. The pulse was 115 ; temp. 104·6° F. ; the skin harsh and dry ; pupils dilated ; the tongue brown and furred ; the bowels regular ; passing but very little urine. I ordered him quinine and saline aperients ; he continued in this state for some days. I found it difficult to satisfy my mind as to the precise diagnosis of this case. The pain in the neck and calves of the legs, with retraction of the head, pointed towards cerebro-spinal meningitis ; but there was no vomiting or increase of the pain on percussing the spinal column. The muscular pains in the back, with the other symptoms, were in favour of small-pox, but there was no eruption. On evening of the 12th of March, the thermometer registered 108·6° F. in axilla, mouth, and rectum, and thinking, perhaps, that the thermometer was at fault, I tried it on three different occasions that night, with the result of satisfying myself of its accuracy, and found it perfectly correct. He complained of no further head symptoms, and was perfectly conscious. Seeing the gravity of the case, as a *dernier ressort*, I had recourse to wet packing with marked beneficial results ; in four hours the thermometer registered 104·6° F., and the next morning I found him much improved, having slept for some hours. On the 13th his temperature was 107° F. in the evening, but yielded again to the wet packing, as also on two other occasions. On the 17th his temperature was 101° F., and remained so for three days ; from this time he commenced to mend, remaining very weak, and blanched in appearance. On the 29th of March I discharged him at Singapore perfectly well ; from the first time I saw him till he was discharged he never had a rigor or complained of shivering. On speaking of this case to Dr. Little, of the Shanghai Hospital, he informed me that a temperature of 104° F. to 106° F. was not uncommon in remittent fever there, but he knew of no case where the temperature went so high as 108·6° F. On my return to Singapore two months afterwards, I saw Abdallah, and he was enjoying perfect health, having had no return of the complaint.

I think that this case is of great interest, as it is the highest temperature recorded, even in remittent fever, where the patient survived, which, in my opinion, was entirely due to the wet packing. I conclude that the case was an aggravated form of remittent fever unaccompanied even by a rigor. I have thought, as practitioners in this country have so few—if, indeed, they have any—opportunities of seeing examples of these kinds of fevers, that a brief record of the leading facts in the case of Abdallah might be acceptable. And the benefit which followed the use of the wet pack will have peculiar interest for many of my *confrères* here at home.

Clinical Records.

ROYAL FREE HOSPITAL.

Epithelioma of Rectum : Excision, with a successful result.

(Under the care of Mr. Gant.)

Operations for the cure of epithelioma of the rectum having recently attracted much attention, the following case of excision will be interesting, as indicating the circumstances under which this operation may be practised, and with the prospect of a successful result. For the report we are indebted to Mr. R. Atkinson, F.R.C.S., senior house surgeon to the hospital.

T. S. was admitted into the Royal Free Hospital in February, 1879, under the care of Mr. Gant. He stated that his present illness had commenced fifteen months ago, he being at that time in Australia. He had then great pain in his rectum and frequent desire to defæcate, but no difficulty in expelling the fæces, and which still continued of natural form. He sought relief in the General Hospital at Sydney, and under the care of Dr. Mackellar, he was discharged apparently cured after about nine weeks. He went to sea, and remained quite well until November, 1878, when pain in the rectum returned, and his motions became small and streaked with blood. He also passed a good deal of slimy mucus, and had frequent attacks of diarrhœa, alternating with constipation. When he came to the Royal Free an annular stricture could be detected opposite the base of the prostate, and the rectum up to that part felt granular and firm. Externally, close to the anus, was a small, hard lump, not unlike a consolidated pile, from the base of which ran a fissure into the bowel. There being some syphilitic history, antisyphilitic remedies were administered, and dilatation with the common bougie was attempted, but soon abandoned. The nature of the new growth having been ascertained by careful examination, its removal was deemed justifiable, as the disease seemed limited to a portion of the gut fairly within reach of the operation, and no functional disturbance of any organ, or constitutional cachexy, gave evidence of secondary cancer. Accordingly, Mr. Gant excised the rectum to the extent of two inches and a half from the anus. The patient having been brought under the influence of ether, an incision was made from the anus to the coccyx, in order to obtain free access to the rectum ; then carrying the knife around the margin of the anus, including only a small fringe of the skin, the gut was easily detached from its loose con-

Digitized by Google

nection in the ischio-rectal fossa on either side. In front, opposite the prostate, the firm fibrous junction with this body was separated by the finger rather than by cutting. Having reached the full extent of the disease, a Smith's clamp was applied, and the isolated portion of the rectum divided with the knife. A few vessels required ligatures, but no sutures were used to attach the end of the bowel to the integument. In the evening some reactionary hæmorrhage was checked by a plug of lint soaked in perchloride of iron. The wound healed gradually by healthy granulation under water dressing and scrupulous cleanliness. Considering the length of time requisite for the healing process over the surface upwards, the natural action of the bowels was not interrupted by the administration of opium. The patient being entirely free from the lancinating pains which had so much distressed him, his general health rapidly improved. He is not troubled with any rectal incontinence, but as soon as the desire to defæcate is felt, he is obliged to go at once to the closet. A tendency to cicatricial contraction around the wound is controlled by the occasional passage of a bougie. This service the patient can now render to himself, and he left the hospital convalescent within three months after the operation.

What may be the ultimate issue of this case is of course uncertain, but the relief of present suffering is certain, and with the prolongation of life.

CONTRIBUTION TO THE STUDY OF THE OSSEOUS TUMOURS ON THE EXTERNAL AUDITORY MEATUS.

By Dr. DELSTANCHE, fils, Brussels.

Translated, by permission of the Author, from the "Mémoires Courronnés et Autres Mémoires," de l'Académie Royale de Médicine de Belgique,

By JAS. PATTERSON CASSELLS, M.D., M.R.C.S., Lond.,

Fellow of the Faculty of Physicians and Surgeons; Surgeon to the Glasgow Dispensary for the Diseases of the Ear; Aural Surgeon to the Glagow Royal Infirmary; and Lecturer on Aural Surgery in the Royal Infirmary School of Medicine, Glasgow; Membre-Correspondant de la Société Royale des Sciences Médicales et Naturelles de Bruxelles.

(*Continued from page* 108.)

THE knowledge of a very interesting case of osseous occlusion of both external meatuses, came to us from Dr. Aldinger, of Furth. At first the tumour was in the right ear, then in the left one of the same person. Both tumours were removed successfully with the help of the gouge and mallet, by Professor Heinecke, of Erlangen.

The case was so much more serious in that, it was complicated with an inflammation of the middle ear, with an abundant purulent secretion and the presence of granulations on the membrana tympani, having a strong tendency to increase. It is therefore almost certain, that without the clever intervention of Heinecke, the patient would have succumbed, sooner or later, to the dangerous consequences of the retention and decomposition of pus in the depths of the auditory organ.

That was the first, and, till now, the only time where the gouge and mallet have been used for the removal of an exostosis situated in the external auditory meatus.

The subject of this observation was æt. 36 when, in 1848, he consulted Dr. Aldinger for a variable deafness in the left ear. On inspection a piece of cerumen was found in a very contracted auditory canal. This contraction arose from an osseous projection having the size of a lentil, and which sprang from the posterio-superior portion of the osseous canal, whence it proceeded in front and downwards, leaving only a small space free between its summit and the opposite wall of the meatus. It was this space that was obstructed by the mass of cerumen whose removal was immediately followed by the restoration of the hearing.

On the right there was the same appearance, but no cerumenous obstruction. What was seen of the membrana tympani did not present anything abnormal.

To begin with, in 1874, the exostosis of the right ear, which had remained stationary till then, commenced to increase in size, and finally the deafness became complete for the voice, whilst the perception of transmitted tones (ticking of a watch), was only heard through the bones of the skull.

At this period the patient consulted several celebrated specialists, who could not agree about what was to be done in his case. V. Troeltsch's opinion was to try dilatation by the use of the laminaria bougies, and to have recourse eventually to the use of the gouge. Politzer advised the introduction of a little tube into the fissure which still existed between the tumour and the wall of the meatus, through which injections could be made, in order to remove the cerumen accumulated behind the exostosis. Voltolini wished to cause its necrosis by divesting it of its periosteum with the galvano-caustic.

At last Heinecke, to whose care the patient finally confided himself, pronounced in favour of the ablation of the tumour by means of the gouge and mallet, a proceeding which he considered to be exempt from danger.

In the last weeks of 1874, the patient had violent pains in the right ear, and which after four days, led to an abundant secretion.

It was now necessary to intervene, seeing that this inflammation was in all probability due, on the one hand, to the pressure of the exostosis on the wall of the meatus, and on the other to the cerumen which had accumulated between the tumour and the membrana tympani. Consequently Heinecke undertook, the 2nd January, 1875, after having put the patient under chloroform, to remove the exostosis by the help of a gouge 3 lines in width. But the base of the exostosis, owing to its extreme hardness, offered such resistance to the instrument that Heinecke had to be content with attacking the top of it, from which he succeeded in removing some little portions.

In spite of the energy here displayed by the operator the reactional symptoms were insignificant.

Towards the third day a little suppuration declared itself, then after an interval of some days two new pieces of bone were expelled. Although the meatus had recovered the half of its normal diameter, the hearing was not improved, on account of abundant granulations on the membrana tympani, in the form of *condylomes acuminés*. The anterio-superior segment of that membrane, was the seat of a little perforation due to the circumstance, that the pus not being able to get out by the meatus had made itself a way in the direction of the tympanum. The vegetations were partly removed by the écraseur, and partly by cauterisation with lunar-caustic, and the use of astringents. Three weeks later the perforation was cicatrised, and under the influence of the air-douche, the hearing was so far improved as to allow the patient to hear the watch at a distance of about 3 feet.

Unfortunately, the denuded surface of the exostosis instead of cicatrising regularly, became the seat of a proliferation of tissue, so active, that the membrana tympani ceased to be visible, except in a very limited part of its anterior segment. Nevertheless, the dimensions of the opening gradually increased, and at the end of 1875, a pigeon's quill could be introduced.

An intercurrent eczema of the external auditory meatus and of the auricle, retarded the recovery, which was, however, none the less complete.

Towards the middle of 1875, the exostosis in the left ear of the same patient, stationary till then, commenced to increase in size. In September of that year, the occlu-

Digitized by Google

sion of the ear by the tumour was complete, and there existed an abundant otorrhœa, whose commencement had been preceded by violent pain.

The same treatment as had been used for the right ear was now prescribed for the left one; but this time the use of the gouge and mallet removed almost the whole of the tumour in fragments. Lint soaked in a solution of carbolic acid served to dress the wound, and with the exception of a violent pain in the ear with a feeling of pressure on the nape of the neck, on the fourth day after the operation, every thing passed off according to our wishes.

On examination of the ear, on the 28th October, it was found that the part corresponding to that which had been occupied by the base of the exostosis, had a reddish surface about the size of a split pea. It was seen that a little bony splinter occupied the centre of this spot, but as it caused intense pain when touched, the idea of extracting it was given up. Two little vegetations covered the antero-superior segment of the membrana tympani, and a little lower down there was a linear perforation in that membrane.

The 12th November the deafness was still as great as before the removal of the osseous tumour, although the granular tissues had been removed in the interval by the application of nitrate of silver and astringent instillations. The perforation of the membrana tympani was of large size. Some days after, the left ear was in turn attacked with moist eczema, and in the course of that affection, the vegetations grew again in great abundance. One of them sprang from the tympanum through the opening in the membrana tympani. In eight days the cure of the eczema was complete, and every trace of vegetation had again disappeared. The patient heard the watch at a distance of 6 in. When the perforation was cicatrised, the hearing distance reached to 30 in. However, the opening of the membrana tympani has been reproduced since, and in March, 1876, there was still a little secretion. Besides, the lumen of the meatus, which, immediately after the operation, equalled two-thirds of its normal diameter, has been, since then, contracted to half that size, in consequence of the swelling of the surface of the denuded osseous tumour. In spite of that, the watch was heard at more than 30 inches, and a low tone, the whole length of the room.

In order to complete what we have already said in regard to the treatment of exostoses of the auditory meatus and to close the series of observations respecting it, the use of electricity for the removal of these tumours, remains to be mentioned.

We have already seen that Voltolini proposed to remove the osseous tumour, in the case which we have just related, by means of the galvano-caustic. But we did not know that it had been already used for that end, until a case published by Dr. Arbo in the *Norsk Magazin for Laegevid* came under our observation, and showed us the benefits that can be reaped from that proceeding, when circumstances favour the removal of exostosis *en bloc*.

V. Troeltsch has long recommended the removal of these productions, when they are pedunculated, by means of Wilde's écraseur. It was a similar proceeding, that Arbo had recourse to, in a man from 20 to 30 years of age, who had suffered for six months from tinnitus and progressive deafness, his auditory meatus being filled by an exostosis as large as a bean. Only, instead of a simple constriction of the tumour, he combined this effect, with that of an intense cauterisation, by using a wire heated to whiteness (*evidently by means of a galvano-caustic battery*), in order to remove the tumour. The hearing was immediately established.

(To be continued.)

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 13, 1879.

THE BRITISH MEDICAL ASSOCIATION AT CORK.

THE cardinal topic of this week's medical journalism must necessarily be the festivities, intellectual and gastronomic, which have come and gone within the "antient citie" of Cork, since we last wrote. Both "those who were there and those who are not," will look with interest to the record of these doings—the one class—that they may see whether their own gratifications or criticisms are duly reflected by their journalist—the other class, that they may know whether their regrets at their own unwilling absence from the scene were justified, and whether they were really wiser to stay at home and mind their business, or would have done better to take the trip to the Green Isle at all risks. Every man looks at these annual gatherings from three points of view, each giving especial prominence in his mind to one or other, and we may follow the example by speaking of this meeting, firstly, as a congress of scientists; secondly, as an assembly of persons interested in the same objects, and joining for the furtherance of their own purposes; and thirdly, as a pleasure excursion in which the enjoyment of a brimming hospitality is the chief business of the time. We avoid the possibility of mingling a carping criticism with what should be unalloyed praise by speaking from the latter aspect of the meeting first. At once we may say that, as an interchange of friendly hospitality, and as a party of pleasure, the meeting was an absolute success. It was more—it was a triumph of energy and warm-heartedness over serious difficulties

Digitized by Google

The increased growth of the Association, it should be recollected, has, of late years, made the task of receiving them doubly difficult for the medical men of a provincial town such as Cork; and so extensive is the organisation necessary for the successful entertainment of the Association that the task can be surmounted only by the medical fraternities of large towns such as Liverpool, Glasgow, and Manchester, or by those who, as did our hosts at Cork, were ready to devote their utmost energies, and a serious part of their resources to hospitality and to organisation. The Cork medical men are less numerous than those of average English provincial towns, and—practising within a comparatively unmonied circle—must necessarily be less independent of monetary consideration. But they set before them the task of acting as hosts to the Association, and we congratulate them on the perfect fulfilment of their aspirations. As that of the originator of the idea and the chief organiser of the reception, the name of Professor MacNaughton Jones was in every mouth, and the indefatigable zeal which he displayed, would alone have been sufficient to stimulate his helpers, if stimulus were necessary.

Not to dwell further on the matter, it was manifest to every guest that no incentive to hospitality was needed, and that, from the venerable President, Dr. O'Connor, and from the President of the Queen's College, every medical man in the City down to Dr. Ringrose Atkins, Dr. O'Connor, junior, and Dr. Jones, himself, were united in the effort to make their guests happy, and to do them honour.

The scientific work of the meeting was as satisfactory as it usually is, the communications being, we think, rather above the average, and an increased interest being given to the work of sections by the presence of distinguished foreigners, American and Continental. The connection of Dr. Jones with this particular meeting was marked by the very successful working of special sub-sections of Ophthalmology and Otology, and the wisdom of separating these specialities from the business of the Surgical Section was justified by the presence of a very unusual gathering of practitioners in these departments, and by the steadiness of their attendance at the business of these sub-sections. No one who was present at their deliberations can doubt that the time has come when these specialities should be recognised as able to stand by themselves, or that it would be for the good of the Association to attract specialists in these departments by providing them with an audience more appreciative than a section of general surgical practitioners can be expected to be. The address of the President was paternal and appropriate, that of Dr. Hudson was most thoughtful and interesting, that of Dr. Fergus erudite and valuable, but the *coup* of the meeting was reserved for Mr. Savory, whose counterblast to Listerism was powerfully planned and magnificently delivered. It was an effort of oratory well deserving of admiration, even if the subject matter of the discourse had been common-place. As it was, the address may well serve as an apology for the system which occupies so large a share of the Association's time with the annual orations on Medicine, Surgery, and Sanitation. Nevertheless, as Savorys are not to be had every year, we venture to suggest that the result derived from these addresses seldom justifies the expenditure upon them of time so greatly needed for the pressing and ephemeral affairs of the profession. At the past meeting were presented reports upon Medical Reform, upon Coroner's Law, Contagious Disease Legislation, Habitual Drunkards, Out Patient Reform, and other subjects without number, respecting which a large proportion of the members of the Association were warmly interested, but which were passed by in absolute silence, wanting the time to enter upon them. It may, we think, be seriously doubted whether such business should be kept in abeyance in order to permit of the delivery of orations which generally are erudite, sometimes interesting, and seldom directly useful; and we think that the experience of all those who attend the Association will corroborate our feelings that some alteration of system must take place, in order that the legitimate scientific and medico-political work may be brought within the compass of the four working days of the meeting's life.

The financial report of the Association inspires some apprehension that the organisation is in danger of outgrowing its strength, and we submit that it cannot be a healthy condition of things that so vast a sum as £12,000 a year should be devoted to the one object, we might almost say, of disseminating the literary contributions of its members, and expressing the views of the Association. We do not decry the value of a journalistic medium to such an institution as the British Medical Association, but we should desire to see a reasonable share of the very large income of the Society spared for the direct furtherance of scientific and medico-political purposes. At least, it would be reasonable that the voracity of the journal should not be allowed to bring the financial balance to the wrong side of the account as it is this year.

THE WATER SUPPLY OF LONDON.

A GROWING interest is manifest in the very important question of a purer and better water supply for London, one of the healthiest signs of which is the anxiety felt by the working classes, who met in a large body at Exeter Hall on the evening of this day week, to urge upon the Government the necessity of procuring powers to provide a constant and purer supply direct from the source whence it is obtained, and at a cheaper rate than is now charged for a bad article.

Mr. Thomson Hankey, M.P., occupied the chair, and he was well and ably supported by gentlemen who have already given considerable time and attention to the question.

A series of resolutions were unanimously passed by the meeting to the effect—"That the present water supply of London is most unsatisfactory in quality, quantity, and cost;" secondly, "That the evils complained of will not be remedied except by creating a new authority and administration;" and, thirdly, "That, with a view to urging this policy upon Parliament, central committees must be formed in the ten metropolitan boroughs, and the assistance of local authorities and Members of Parliament evoked to find a remedy for the evils complained of." Of the several questions brought under discussion

Digitized by Google

there can be no doubt that that of the quality of the water is of by far the greatest importance—and for this reason, that upon it rests the health, and physical condition, and life of the community. Men of science, who have studied the subject with a singleness of purpose, and purely with a view of benefiting mankind, are perfectly in accord so far that nothing short of a purer and better supply of drinking water can be accepted as a final settlement of the difficulty. They are equally agreed as to the characteristics of a good and wholesome water supply. In the first place it must not only be quite free from organic matter of every kind, but at no times or seasons, or in periods of epidemics, must it be liable to be made a means of propagating disease, and endangering life. That it shall contain in suspension only a minimum of mineral and other matters that may act upon the lead pipes, and form a hard deposit when boiled. That when viewed in bulk it shall be clear and bright, and refreshing to the taste. to ensure this it shall be well aerated, and of a tolerably uniform temperature—that is to say, not above 51° Fahr. in summer, and much about the same in winter. These several points must be secured, otherwise it will be impossible to say that the water is all that we have a right to look for in a good, potable, drinking water. Nothing short of the conditions enumerated will be regarded as a satisfactory adjustment of the question at issue between the public and the water companies. Owing to the gigantic monopoly created by these companies, the public have hitherto only seen their just complaints met with a corresponding increase in dividends, made by increasing the rates. It is now quite obvious that the four millions of London's inhabitants must put up with its inferior and most unwholesome water-supply, at the dearest possible price, unless some determined action be at once resolved upon.

The sources from which the greater part of the London water is derived proves the position we have assumed of badness. The Thames, from whatever part of its course water may be collected, must be, and will remain, from the nature of things, most objectionable. After every rainfall it becomes more foul and more muddy, highly contaminated by the organic matters which are washed from the surface soil into the water shed. This is unavoidable, since an enormous floating mass of people, and a still larger number living on its banks are constantly pouring an enormous quantity of sewage and filth into it. It is an established fact that the consumers of Thames water simply "drink in a circle." The water of the New River Company is little better in quality.

It is quite reasonably a subject of grave complaint against this Company that it purposely spoils the good water it collects, by sending it from its Hertfordshire source through an open channel of twenty miles long, thus exposing it to constant deterioration and contamination from a variety of sources. And not content with having so far damaged its quality, it stores its water in large open reservoirs, and there leaves it to be acted upon by the sun, which promotes a rapid growth of vegetable and animal life, and which at the same time either raises or lowers its temperature to that of the surrounding medium. The New River Company supplies nearly a quarter of the inhabitants of London, and with the exception of a small part of the metropolis, within the jurisdiction of the Kent Water Company, the rest are compelled to drink water drawn from the Thames and Lea. The method employed by the Companies to free river-water from impurities is simply by passing it through a stratum of gravel and water-logged sand; a rude, coarse process termed filtration, which, in fact, as often tends to make bad water worse by accummulating remains of organic life, *débris* which is ultimately held in solution, and passed through the filter beds and service pipes into the cisterns of the consumer.

It sickens one to think of the very unsatisfactory condition of the London water in this respect. No physical difficulty exists for the removal of the evil, nor stands in the way of obtaining a purer and better supply. London is, indeed, exceptionally situated for the purpose; it is surrounded by high chalk hills. Stored up in the North Downs there are enormous quantities of water—a store practically inexhaustible, and of the very purest description. By gravitation this water could be conveyed at high pressure all over the metropolitan area. It has but one fault, and this can be easily remedied, and by an inexpensive method. It is too hard for domestic purposes, but by Clark's softening process it is quickly reduced to seven degrees of hardness per gallon. But withal the deep chalk water possesses the very great recommendation of being well aerated, clear, bright, cold, wholesome, invitingly palatable, and perfectly free from all noxious and dangerous contaminations. As to the less important questions of who shall be empowered to bring the much-needed pure water into London, and the cost to the consumer. This can be disposed of without difficulty. If the companies who have so long enjoyed the monopoly of selling bad water refuse to undertake it, then by all means let Parliament confer the power on those who will. There will, we apprehend, be little difficulty in this respect, and the cost in the aggregate we are assured will not greatly exceed that of the proposed change of fittings which will have to be made to secure a constant supply. Neither points need long delay the settlement of a question, in which the health and life of the inhabitants of London is concerned.

So far as future control goes, we hope it will not drift into the hands of a central board. London is much too large for this. Local district boards established in the several boroughs will be more accessible in every way; and can be moved to act in the interests of the ratepayers. In their hands Parliament should place the power of regulating the cost and supply, as is the case in Paris, and which, we believe, has been found to work well for all concerned.

DR. ANDREW CLARK'S ADDRESS ON MEDICINE.

If the advancement of Practical Medicine fails to keep pace with the progress of other branches of knowledge, it will not be for want of teachers to tell us the way in which we should set about making medicine more exact as a science and more serviceable as an art. Whether the British Medical Association has done so much for the "Advancement of Medical Science," as might have been expected of it, we shall not stop to inquire. But this much

Digitized by Google

is certain, that many of its most eminent members have, through several "addresses," performed a useful and promising task in taking stock of what we have done and what we have failed to do, in surveying the fields of future investigation, and in showing by what means we may hope to add to the past achievements of medicine, and to increase her services to mankind. The addresses that have just been delivered under different sections of the British Medical Association are particularly characteristic of one of the most prominent features of modern medicine, and of the transition stage of medical inquiry and practice, through which we are now passing. They are more prospective than retrospective, more suggestive than practical, more hygienic than therapeutical. One of the best of these addresses is on Antiseptic Surgery, another on Preventive Medicine in general, a third on Medical Education, and the prospective advancement of scientific medicine. To some of these subjects we must refer at some future time; now we shall confine our remarks to the excellent address on Medicine by Dr. Andrew Clark, in which he successively discourses on medical education, the present state of therapeutics, and the prospects of experimental inquiry.

Dr. Clark very properly begins his address by deprecating that optimist view of medicine that had been taken by some of his predecessors, for very little improvement is likely to be achieved by those who regard with too much complacency what they have already done.

"Nothing in this matter contribute more to imperfect vision, as well as to imperfect action, than self-satisfaction. In professions, in individuals, and in people alike, it is an obstacle to progress and a prelude to decay." In reference to the first subject of his remarks, Dr. Clark alleges eight principal reasons why the present system of medical education is found wanting, all of which, however, may be said to be summarised in the last and very truthful proposition that the "main tendency of the present system is to give students smatterings of scientific knowledge at the cost of that thorough knowledge of their art which is essential to its successful exercise." It has added to the curriculum, and enlarged the range of examination, while it has left the time for study the same. Some of the subjects of study are difficult to acquire, worthless as mental gymnastics, useless in practice, and speedily forgotten when acquired. One stage of medical education interferes with another. The student can do as he likes about attending regularly in the wards. The pass examinations are so constructed that they reflect the character and extent of the previous instruction, so that the qualified student knows a little about what he does not need, and is ignorant of what he should have acquired in the wards. Hence, moreover, imperfect and even vicious methods of teaching. The student is told not taught. Such are the more serious allegations which Dr. Andrew Clark brings against the present system of medical education. We regret that we cannot say he has either exaggerated or misrepresented the case; for we have ourselves, on more than one occasion, noticed the many defects inherent in our present system of medical education, and the necessity of giving a little more attention to the teaching at our medical schools, instead of confining our criticism, as we have been hitherto doing, to the several bodies. Nevertheless, there is no reason why a knowledge of such subjects as botany, chemistry, &c., should not be still required of a candidate who wishes to enter the profession. The mistake at present committed does not consist so much in the fact of their being taught as in the way and the time in which they are taught. We do not think that even botany ought to be altogether discarded from the preliminary education of the medical student. So far from a knowledge of this science being "worthless as mental gymnastics," it is, to certain extent, particularly applicable to the mental training of youths who intend to enter the medical profession, and may even be made to assist them in acquiring a knowledge of one of the most important departments of practical medicine, namely, the diagnosis of disease. No one will deny that the differential study of the more important orders into which plants are divided, and the habit of distinguishing the character of one natural order from another, will educate the mind of the student in those habits of generalisation and discrimination which cannot fail to be of use to him, when he undertakes the difficult task of correctly interpreting the manifold and often perplexing symptom of disease. But of course this is no reason why the student should be compelled to attend a long course of lectures on structural and physiological botany, when a few practical demonstrations on systematic botany would answer all the purpose for which this subject has been introduced into the medical curriculum. And so with chemistry, which, for very obvious reasons, cannot be given up, but the practical teaching of which might be very advantageously modified, or in a great measure made along with botany, a part of the *general* rather than of the medical education of the practitioner in medicine.

There are other portions of this excellent address equally worthy of notice, but the subjects to which Dr. Clark directed the attention of his auditors are too important to write hastily upon them, and, therefore, we must postpone our remarks for a future occasion.

Notes on Current Topics.

Army Medical Department.

The following is the list of candidates for commissions as surgeons in Her Majesty's Indian Medical Service who were successful at both the London and Netley Examinations, August, 1879:—F. F. Perry, 5,535 marks; P. W. Dalzell, 4,934; S. Little, 4,930; G. H. D. Gimlette, 4,910; C. B. Hunter, 4,837; M. Gaisford, 4,835; C. H. Murray, 4,580; W. F. Thomas, 4,398; J. C. Smith, 4,388; H. G. L. Wortabet, 4,275; E. P. Frenchman, 4,071; R. James, 3,949; S. C. Sarkies, 3,846; D. S. E. Bain, 3,622.

It should be understood that this list does not represent any new admission of candidates to the Army Service, but only the passing of the last batch of candidates out of the Netley School; they having fulfilled their studies there.

We have good authority for the statement that the

Digitized by Google

authorities have abandoned the proposal to hold an examination for either the Army or Naval Medical Services this autumn, because of the miserable number of the students who offered themselves. We believe that the new Warrant is finally agreed to by the department, but is delayed in its promulgation by the Treasury, who grumble loudly at the bill, and protest that they can't afford the money. But the money must be afforded. The profession has shown itself properly stubborn in its refusal to sell itself under its fair price, and, if it maintains its self confidence, it is as certain as anything can be that the War Office will be obliged to concede what is fairly due to the army medical officers. We have reason to know that, in spite of the rose-coloured representations of Colonel Stanley in the House of Commons, the army authorities have learned, and are well aware, that the experiment of enlisting the civil practitioner in any other capacity than that of a dresser under the control of a sufficient number of thoroughly-qualified army surgeons, must not be repeated, and that that method of saving money does not pay.

We are able to say with certainty, that in the Irish schools, there is, at this moment, an overflowing supply of students who would offer themselves for the Army Medical Service if they could see before them a fair hope of being fairly and honestly dealt with, but who have held back, and will hold back, until they know the service into which they are invited to enter. We know of one "grinder" who has fourteen such men waiting, ready to step into the examination-room; but they will not go, and he would not send them there as long as the service is as it is.

Death from Hydrophobia in Dublin.

Much excitement has been caused by the death of a lady, æt. 25, the daughter of Dr. Collins, from well-marked hydrophobia, in the Meath Hospital. On the 11th of June last a fox terrier dog belonging to Miss Collins, after being absent from the house for a day and a night, returned home in a "worried" condition and much cut and bruised on the head, as if he had been fighting. The deceased was examining the dog, when he suddenly flew at her and fastened upon her lip, hanging for a considerable time there with the whole weight of his body. Dr. Gunn was immediately sent for, and instantly came and cauterised the wound. No bad symptoms manifested themselves until Saturday week, when the deceased complained of neuralgic twitching in the lip. On the following day the hydrophobia fully developed itself, and on Monday she was removed to hospital, where she died last Thursday week.

It is worthy of mention as bearing upon the neurotic nature of the disease that the deceased lady was exceptionally strong-minded and courageous, and though perfectly conscious of her impending death, never lost her firmness and resignation.

University Degrees for Women.

A petition on this subject lies for signature in Dublin by those interested in the higher education of women. It urges—"That the creation of a new Irish University not only affords an opportunity of meeting that demand without prejudice to any existing interests, but that the omission to do so efficiently now will place fresh difficulties in the way of doing so on a future occasion.

"That the London University having thrown open all its examinations and degrees and rewards to women, supplies a model in this respect, which shows with how much ease a University which is intended to resemble it in other respects could do the same.

"That the University of Dublin and the Queen's University in Ireland have proved in many important ways their desire to assist this movement, and that therefore the omission of sufficient power in this behalf conferred upon the proposed new University would be a direct deprivation imposed upon the directors of higher education in Ireland."

The petitioners pray that the Irish University Bill may be amended so that provision may be made for the conferring of degrees in all faculties on women on the same conditions as on men.

Murder of an Army Medical Officer.

The *Times of India* gives the following details of an outrage committed in Afghanistan:—"Surgeon W. P. Smith, attached to the Kuram force, was stabbed by tribal thieves. He was on his way to Kuram, and pitched his tent inside the camel enclosure. He appears for some reason to have left his tent, and to have wandered about inside the enclosure. About two o'clock in the morning a cry from him is said to have been heard. The inmates of the enclosure raised shouts, and a party from the military post came down. They found Surgeon Smith dead some fifty yards from his tent inside the enclosure, with three severe sword or knife cuts on the chest and both arms. The cause of death was a cut across the chest. Mr. Smith had only been in the Indian service about two years."

Lesion of Renal Epithelia in Bright's Disease.

Prof. Cornil has presented an interesting memoir on this subject to the French Academy of Sciences. In a first case of albuminuria, of only two months' standing, with great reduction in the amount of urine, and even anuria at times, fragments of the kidneys were hardened by osmic acid. The microscope showed that in most of the remaining convoluted tubules, the epithelial cells contained large vacuoles, each filled by ball or mass of albuminoid substance. The lumen of tubuli held numerous such masses or drops, and in places these products caused distension of the tubules. As a proof that these masses were derived from the epithelia, Cornil avers the fact that *empty* epithelia were also to be seen. He believes that hyaline and colloid casts are formed in the tubuli recti by the fusion of these masses; and he establishes an analogy between morbid secretion by renal epithelia, and the normal secretion of mucus by epithelia of the digestive tracts. The same lesion was found by the author in two other cases of Bright's disease, and in one case of cystic disease of the kidneys. The lesions may be seen in preparations made by means of Müller's fluid, but not as clearly as after hardening in osmic acid.

"L'Enfance a Paris."

In a long notice the Paris correspondent of the *Globe* recently called the attention of its readers to an extraordinary and interesting work written under the above title by Vicomte d'Haussonville. The indefatigable author appears to have visited every hospital, infirmary, asylum, and place of refuge for children in France and England, and to have made himself thoroughly acquainted with every haunt of juvenile misery and crime to be found in the city of Paris. The dreadful temptations, and the physically and morally unhealthy surroundings of pauper children in that and other large centres of population are faithfully and minutely exposed, with a view of showing what a large field is open to the enterprise and benevolence of the practical philanthropist. In respect to our hospitals, the author speaks in the highest terms of the hygienic principles on which these institutions have been constructed, but he does not approve of the method of admission practised at the majority of our London hospitals. With the exception of the Royal Free Hospital, he considers that an erroneous policy is being followed by giving admission only to those who can procure letters, and thus form a privileged class of "poor people who have friends."

A London hospital cannot, he says, be compared with similar institutions in France, as the visitor fails to find in the wards "those specimens of man and woman worn out by poverty and wretchedness, their constitutions impaired by gin, to be met with in the public streets, barely concealing their skin and bones under rags which at one period have been garments of cloth or silk." The hospitals in London are tenanted by the middle classes—the poor are compelled to take refuge in the workhouse, which is an asylum and a hospital at one and the same time. He describes what he saw on his visit to the Gray's-Inn Infirmary, where the dying man was breathing his last amid the conversation and laughter of his convalescent colleagues in misery huddled round the fire, and he regretted that there were no curtains, as in France, to draw round the bed of the sufferer, and none of those pious emblems which comfort the dying with the thought that they are leaving a world of pain, and treading on the confines of those realms where sin and sorrow enter not.

These and other animadversions on the internal arrangements of our workhouses, infirmaries, &c., are by no means flattering to our social economy, or even to our humanity. The sights which Vicomte d'Haussonville has witnessed in this country are certainly such as we ought to be ashamed of, but we cannot expect that either pauper children or pauper adults will receive much consideration at a time when the alleged sufferings of a few "vivisected" dogs are attracting the almost undivided and fulsome attention of our English humanitarians.

A Curious Suggestion.

We hear that a Russian physician, M. Malarevsky, struck by the prevalence of short-sightedness among literary men, proposes that books should be printed in white ink on black paper, and he has made experiments with 50 persons which tend to confirm his view. This appears to us not only a curious, but a very "short-sighted," suggestion. To say nothing of the prejudices and commercial difficulties in the way of carrying out such a recommendation, there is every reason to believe that it would not attain the object this physician has in view, and that it would probably be more injurious to the eyes than the plan universally adopted. In reading a book it is not so much the white paper as the small black print, that catches the eye. Now, were a book printed as M. Malarevsky suggests, it would be the small white print—made all the brighter by contrast—which would chiefly attract the eye, and which in the long run would be far more injurious to the sight than the black print. Nor do we think that shortsightedness among literary men need create so much anxiety as to induce us to adopt extraordinary measures of prevention. As a rule, people who have this failing have a very strong sight, as most doctors and literary men will admit. Besides, it is a mistake to attribute the myopia of literary men to their much reading, as it is frequently hereditary or congenital, and often very marked in children long before they have taken to their books.

Brain Volume and Brain Power.

The cranium of Descartes, says *Nature*, is often adduced as an exception to the general rule that a great mind requires a large brain. This statement seems to hav rested on no exact measurement, and Dr. Le Bon resolved recently to test its accuracy. The result is that he finds the cubic capacity of Descartes' skull to be 1,700 centimetres, or 150 centimetres above the mean of the Parisian crania of the present time. At the same time Dr. Bordier has recently found the average capacity of the skulls of 36 guillotined murderers to be 1547,91 cubic centimetres, the largest reaching the enormous figure of 2,076 cubic centimetres.

It is a well-known fact that the size of the skull is no criterion of the value of its contents—those of Voltaire and Sir Isaac Newton to wit. Nor is this to be wondered at, considering that the grey matter of the convolution is the seat of the intellect, and may be relatively deficient when the rest of the cerebrum is very large, and *vice versâ*.

156 Grains of a Hydrate Chloral taken at a Single Dose.

In the *Centralblatt fur Chirurg.* Dr. Bishop reports the case of a hard drinker, æt. 32. Had delirium tremens and had not slept for sixty hours. After taking above dose, zinc and ipecac were given to produce emesis but to no effect. No stomach pump could be obtained. Profound sleep followed. Pulse when highest was 132 in the first hour; then sank to 88, awoke, free from his delirium and pain.

The hearing of the case of alleged illegal incarceration and detention of Dr. Nowell—Nowell *v.* Williams—in a lunatic asylum, after occupying the attention of the Lord Chief Justice and a special jury for the last ten days, has been postponed to November, to oblige the lawyers. (I patients are not quite so considerate when we are desirous of taking a holiday.

Digitized by Google

Mr. Leet has been re-elected as the Representative of the Apothecaries Hall of Ireland on the General Medical Council.

We understand that in consequence of the pressure of professional engagements Dr. Dobell has resigned his post of Physician to the Great Britain Mutual Life Association.

The rates of mortality per 1,000 last week in the principal large towns of the United Kingdom were again exceedingly low, being in Portsmouth 12, Bristol 14, Nottingham 15, Sunderland 15, Leicester 16, Norwich 16, Liverpool 16, Glasgow 16, Leeds 17, Birmingham 17, Brighton 17, Bradford 17, Edinburgh 17, Hull 18, Newcastle-upon-Tyne 18, Sheffield 19, Salford 19, Manchester 19, London 19, Wolverhampton 20, Oldham 21, Plymouth 21, and Dublin 23.

The *Pall Mall Gazette* commenting upon the close of the London season, thinks the general depression in trade has not been without its effects for the better upon "society." The season has really been in some respects remarkable for a tendency to long-needed reforms in social habits. There has been a faint attempt at earlier hours, less universal extravagance, some little thought of the relation between health and diet in the matter of dinners, and perhaps not quite so great a yearning for scandal as of late years.

The rates of mortality, in the principal foreign cities according to the most recent weekly returns, were—Calcutta 25, Bombay 28, Madras 28; Paris 22; Geneva 17; Brussels 26; Amsterdam 17, Rotterdam 27; The Hague 20; Copenhagen 20; Stockholm 19; Christiania 23; St. Petersburgh 33; Berlin 44, Hamburg 22, Dresden 19, Breslau 26, Munich 30, Vienna 26, Buda-Pesth 37; Rome 26, Naples 34, Turin 30, Venice 28; Alexandria 35; New York 24, Brooklyn 32, Philadelphia 25, and Baltimore 26 per 1,000 of the population.

It is intended to hold an exhibition of scientific specimens and apparatus during the meeting in Sheffield of the British Association, which commences on August 20. Those who desire to exhibit scientific inventions, preparations, and appliances should apply immediately to the Local Secretaries, B.A., Sheffield. Major Serpa Pinto will probably be present at the meeting, and give an account of his extraordinary travels in Africa; and Lieut. Wyse will also describe his recent explorations in the Isthmus, a name that is now understood to cover the whole stretch of land embraced by the different inter-oceanic canal schemes.

The death-rate in the large towns last week from the seven principal zymotic diseases averaged 2·9 per 1,000. Measles showed the largest fatality in Bradford and Leeds; scarlet fever in Oldham; and whooping-cough in Bristol. Small-pox caused 5 more deaths in London, 4 in Dublin, and one in Nottingham; no fatal case was recorded in any of the other large towns. Only 86 deaths were referred to diarrhœa in these towns last week, against 851, 304, and 1,159 in the corresponding weeks of the three years 1876-7-6. Such an exceptionally low rate at this season of the year was never before on record.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

University of Edinburgh.—Medical Graduation.—The ceremony of capping the graduates in medicine of the year took place on the 1st inst., in the General Assembly Hall of the Church of Scotland, in presence of a large and fashionable audience. The Chancellor of the University (the Lord Justice General) presided; and there were present Principal Sir A. Grant, Bart.; the Lord Provost of Edinburgh, Sir Robert Christison, Bart.; Professors Campbell Fraser, Tait, Turner, Maclagan, Rutherford, Simpson, Wilson, Taylor, Annandale, Spence, Grainger Stewart, Nicholson (St. Andrews), and Dr. Clouston. There were no honorary degrees conferred; and the capping of the graduates was at once proceeded with. Thirty gentlemen received the degree of M.D., 96 that of M.B. and C.M., one B.M. only, 2 C.M. only. Gold medals were awarded to the following gentlemen for their theses in connection with their graduation as doctors of medicine:—Dr. John Cash (on Separated and Unseparated Muscles); Dr. John William Dodds (the Brain of the Mole); Dr. James Miller Helme (on Acute Rheumatism, with Observations on Salycilate of Soda); and Dr. William Stewart (on Spina Bifida). Among the special prizes, the Ettles prize, for the most distinguished among the M.B. graduates of the year was awarded to Alexander Bruce, M.B., C.M., who had obtained the full complement of marks during the whole series of his examinations. The Beaney prize was divided between J. H. M. Beck, M.B., C.M. and Edwin Hyla Greves, M.B., C.M., for the excellence of their exercises in the subjects of anatomy, surgery, and clinical surgery; and the Wightman, for the best report and commentary of cases observed in the clinical wards of the Royal Infirmary during 1878-79 to Mr. James Leith Waters. The Hope prize in Chemistry was awarded to Mr. John A. Blaikie, D.Sc., Scotland. The Cameron prize was awarded for the first time. It was founded in 1878 by the late Dr. Andrew Robertson Cameron, of New South Wales, to be given annually at the ceremony of medical graduation, to the practitioner or member of the medical profession who shall during the previous year have made the most important addition to practical therapeutics. This prize has been awarded to Paul Bert, Doctor of Medicine and Professor in the Faculty of Science of Paris, for the researches summarised in his work, entitled "La Pression Barométrique, récherches de Physiologie Experimentale," published in 1878. The investigation of the influence exerted by the barometric pressure on vital functions has occupied the attention of Dr. Bert for many years. His researches have been considered of so great value that he was awarded the prize for Experimental Physiology by the Academy of Sciences in 1865, and the "Grand Prix Biennial" of the French Institute in 1875. Among the results gained by his industry are the scientific explanation of the beneficial results of diminished barometric pressure in the treatment of phthisis and anæmia, definite indications to be pursued in the treatment of asphyxia, and of poisoning by carbonic oxide and sewer gas; and the means to be adopted in order to avoid the dangers to which divers, workers in mines, and those who are liable to be brought under the influence of atmospheric pressure are subjects. They likewise show the influence of atmospheric pressure on nutrition. Dr. Bert has also studied the influence of atmospheric pressure on anæsthetics. Dr. Bert was unable to be present on account of his duties as a member of the Chamber of Deputies in France. Professor

Digitized by Google

Grainger Stewart then addressed the graduates, explaining that it had fallen to him to do so owing to the much regretted illness of Professor Wyville Thomson. He congratulated those who had been advanced to the full degree of doctor of medicine, and he prayed them to remember the trust which was that day placed in their hands, and the responsibilities it implied. He congratulated, also, those who had obtained the degree of M.B., that the Chancellor's touch had made them legally-qualified practitioners; and he congratulated them on the fact that they were university men, that they had not obtained that day a mere license, but that they had received as students the impress of that higher culture, and as graduates, the higher status which a university of necessity gave. Lastly, he congratulated them on being graduates of the University of Edinburgh, which he took leave to say was surpassed by none of the seats of learning. He substantiated the grounds of that claim by a long list of distinguished physicians and surgeons who were *alumni* of the University. Professor Stewart concluded with a few sound admonitions as to the future conduct of the graduates.

Glasgow Royal Infirmary.—Important Operation.—Dr. McEwen performed a formidable operation at this institution on the 1st inst. It embraced the removal of the larynx, and portions of a cancerous mass lying over the prevertebral surface. Dr. McEwen should exhibit this larynx at the Medico-Chirurgical Society, that its *pathological peculiarities* may be seen, and studied; and thus, he would confer a boon upon the profession by publishing a full account of the whole case. The patient was alive on the day following!

Health of Glasgow.—According to the last forthightly report of the medical officer of health, there were 381 deaths registered, as compared with 461 in the fortnight preceding, representing a death-rate of 17 in place of 20½ per 1,000 living. The death-rate in the first week of the fortnight was 16; in the second, 18. The number of deaths of persons aged below 1 year was 75 in place of 76, and of persons aged 60 years and upwards, 58 in place of 70, as compared with the fortn'ght preceding. The number of deaths from pulmonary diseases was 109 in place of 164, a diminution of no less than 55, and constituting 28 per cent. in place of 36 per cent. of the total deaths. The number of deaths from fever was 8 in place of 9, namely. 5 from enteric fever, and 3 from typhus. The number of deaths from infectious diseases of children was 19 in place of 32, namely, 8 from whooping-cough, 7 from scarlet fever, and 4 from measles. The aggregate death-rate was only 17 on the Registrar-General's population, or 18 if we take our own estimate. The number of cases of fever registered was 29 in place of 26, namely—15 typhus, and 14 enteric fever. There were also 79 cases of measles, 43 of scarlet fever, 41 of whooping-cough, and 11 of diphtheria, which were the occasion of sanitary interference. There are at present in the hospitals of the board 47 cases of scarlet fever, 31 of typhus, 26 of enteric fever, 10 of whooping-cough, and 6 of measles, in all 120, as compared with 123 this day fortnight.

A New Milk Adulterant.—Last week, at the meeting of the Glasgow Health Committee, a statement from the city analysts was read, in which they reported the testing, under the Foods and Drugs Act, two samples, consisting of one of sweet milk, and one of colouring matter. The latter was found to be annatto, and the sample of milk seized at the same time was found to contain this colouring material, and to be adulterated with a small proportion of water. The object of adding annatto is to give to the milk a rich yellow colour and conceal the addition of water. The dye-stuff is not known to be injurious to health, but the use of it is very hurtful to the honest dairyman, whose milk looks poor and thin beside the artificially-coloured article, in which competition those who went on the principle that "honesty is the best policy," would undoubtedly be worsted.

THE BRITISH MEDICAL ASSOCIATION AT CORK.

The Forty-seventh Annual Meeting of the Association opened on Tuesday, the 5th, at the Queen's College, a *habitat* which was in all respects sufficient and suitable for the purposes of such an assembly. The number of members who assembled—for a first day, and considering the distance from the English and Scotch centres at which the meeting took place—was large. The outgoing President, Dr. Falconer, of Bath, was in the chair, and reviewed briefly the business done, and to be done, by the Association during the year. Amongst other things, the President referred to a report by Dr. Taylor on Pleuro-pneumonia, and to the promise of an exhaustive report on Hydrophobia, to be brought before the meeting by Mr. Callender. He referred to the very important question of Patients' hospitals reform, and promised an interesting report. As to the resolution of the Committee of the Council to award its gold medal to Surgeon-Major Reynolds, the President said that it was a matter of very great pleasure to him to be able to say that he has had that medal awarded to him, because he is one of those whose names should be added to the list of heroes who claim as their native soil what Moore calls "The emerald gem of the Western world."

Dr. Falconer then vacated the chair, and Dr. O'Connor took it as President of the Association for the ensuing year, at which juncture the President of the Queen's College announced, amid applause, that the Senate of the Queen's University had decided to confer upon the incoming and outgoing Presidents of the Association the degree of M.D. Q.U.I. (*hon. caus.*), expressing at the same time his regret that the statutes of the University prevented that being done in any place save Dublin.

The thanks of the Association were then voted to the ex-President, on the motion of Dr. Waters.

Dr. Falconer having briefly acknowledged in suitable terms,

Dr. Carpenter said he wished to read out a list of a number of distinguished foreigners who were present. Their names were as follows:—

Professor Charcot, Professor Ball, Dr. Gallard, Dr. Bonnafont, Dr. Löwenberg, and Dr. Gueneau de Mussy, of Paris; Dr. Herschberg, Dr. Weber-Liel, and Dr. Martip, of Berlin; Dr. Giacinto Pacchiotti, of Turin; Dr. Condes, of Geneva; Dr. Lewis A. Sayre, President of the American Medical Association; Dr. Beard, Dr. Sequin, Dr. Gray and Dr. Hodgkins, of New York; Dr. Yandell, of Louisville; Dr. Lawrence Turnbull, Dr. Da Costa, and Dr. A. B. Palmer, of the University of Michigan.

Dr. O'Connor then delivered his Presidential address, which we print in another part of our issue, and which evoked warm applause at its termination.

Dr. Carpenter then read the annual report of the Council. Referring to the financial state of the Association, it said that the receipts for the past financial year amounted to £12,433, and the payments to £12,939; thus the payments exceeded the receipts by nearly £500; but the revenue, or profit and loss account, shows a balance in favour of the Association on the year of £769 16s. 10d. Last year the Council considered was exceptional, as the cost of adapting the office premises to the

Digitized by Google

business requirements of the Association, &c., rendered the expenditure unusually heavy, and "part of this will not necessarily recur."

Your Council, in spite of the £500 deficit, congratulate the members on the financial position of the Association. The total of excess of assets over liabilities at the close of the year amounted to £6,219.

This part of the report was received by many members with some misgiving, they finding it difficult to comprehend the amount of congratulation which the Association was entitled to receive upon an admitted deficit of £500 on the year's operations, for which there did not seem to be a very obvious reason.

The report having referred to the grant of the gold medal to Surgeon-Major Reynolds, proceeded to refer to the legislative work of the Association during the past year.

The work of the Habitual Drunkards' Committee, the Council thought, had been fairly successful. Dr. Cameron's Bill had become law, and the principle of detention of the habitual drunkard had been affirmed by both Houses of Parliament. There will be less difficulty in applying its principles to the cure of the many, when it has been conclusively shown that those who voluntarily submit themselves to its provisions are ultimately restored to a condition which fits them again for mingling in society.

As to out-patient reform, a number of conferences had been held, but nothing actually done in the matter. As to medical reform, the report said "The situation was at one time sufficiently perplexing, but the bold course followed by the Committee, with the approval of its Parliamentary advisers, has been thus far justified by the result. The twofold object of the Committee in re-drafting and re-introducing Bill No 2, was to present to Parliament, in a connected form, the views of the Association on the entire subject; and to compel a reference of the various measures to a Select Committee of the House of Commons, with the view of eliciting full information on the points in dispute. This end is now in course of attainment, by the examination of witnesses, and the publication of their evidence. These materials will be of great value, when the work of legislation is resumed in next session, or in next Parliament, and cannot fail to strengthen the demands which the Association has so long been making, for the establishment in each division of the kingdom of a single door of entrance into the profession of medicine; and for the recognition, by the tardy concession of direct representation on the General Medical Council, of the right of the medical profesaion to a voice in the management of its own affairs, and the shaping of its future destinies.

The Parliamentary Bills Committee have been occupied with several subjects of considerable importance to the profession. The representation of the Committee concerning the Army Medical Department have included a careful review of the recommendations on this subject of the Departmental Committee. Many of the recommendations of this Committee were of a very satisfactory nature, including the abolition of the short term of service. On other points, especially the abolition of public competition, the Parliamentary Committee have made representations to the Government to the effect that they are convinced that no system of admission into the Army Medical Department which excludes fair and open competition will ever be satisfactory to the bulk of the profession, or to the public."

As to the "Lost Medical School of Oxford," a memorial had been prepared praying that means may be taken to restore to the University an efficient faculty of medicine, to renew the prosecution of medical studies in the University of Oxford, and to utilise the large special endowments which the University possesses. This memorial was approved by the Committee of Council, and circulated in the journal by its authority, and has received the signature of upwards of 2,000 members of the Association. Further reports have been made to the Select Committee of the House of Commons on the subject of the Coroners Bill.

The reading of the report and statement of accounts having concluded, Dr. Grimshaw proposed their adoption. It had been very gratifying to the Irish Medical Association to find that the British Medical Association had adopted so many of their views, and had endeavoured to carry them out in a way that would be very difficult for the Irish Medical Association to carry out, established as it was in Dublin, where they had its headquarters. He (Dr. Grimshaw) had been requested by the chairman of the Irish Medical Association to express their thanks to the sister Association in the assistance which they had given them.

Dr. Martin, of Portlaw, before the resolution was put complained that it was the opinion of many members of the Association that the editor of the *British Medical Journal* had outstepped his duty in writing in the way he did during the last year with regard to lunatic asylums. (Applause). He did not wish to propose an amendment, inasmuch as he was satisfied to see that the feeling of a large section of the meeting concurred with his, but he thought such conduct ought to be condemned.

The proceedings terminated.

The reception by the President of the Association and the Local Reception Committee took place on the same evening at the Queen's College, and was very numerously attended. The grounds and rooms were illuminated with the Jablochkoff candle, upon which a lecture was delivered by Mr. Berley.

Wednesday, August 6th.

The Association assembled at 11 o'clock to hear the Address in Medicine from Dr. Hudson.

Dr. Carpenter, President of the Council, opened the proceedings by announcing that the Council at their meeting that morning had received a very cordial invitation from Cambridge, to visit that important city next year, and it was unanimously decided by the Council to accept the invitation, and to accept also the nomination of the gentlemen of Cambridge that Professor Humphry be the President-elect for the next year.

The recommendation of the Council was then unanimously adopted.

Dr. Hudson, Regius Professor of Physic in the University of Dublin, then delivered the Address in Medicine, taking for his subject—"Lænnec: his Labours and their Influence in Medicine," which we purpose giving in our next.

Dr. Andrew Clark, in proposing a vote of thanks to the lecturer, said Dr. Hudson was one who occupied—and he was sure they would agree with him, occupied justly—one of the most prominent positions amongst the physicians not only of this country but of this Empire. He was beloved by his profession because he had always been loyal to his profession, generous to his contemporaries, and more than kind to his youthful brethren, and he was more than respected, he might be pardoned if he said he was revered by the public, because they always found in him a man of unsullied honour and unbending integrity.

Dr. Ringrose Atkins, in seconding the resolution, said Dr. Hudson had thrown himself into the history of his art, and he had recalled to their minds the names of men who stood like bright beacons, shedding a flood of light over centuries.

The President, in putting the proposition, said after a friendship of half-a-century, or nearly so, there had been, he was proud to say, a close friendship between Dr. Hudson and himself. He was his fellow student under Stokes, but he was far in advance of him (the President), and he was adopted by Stokes when he was merely a stranger in the country—adopted by him as a pet and favourite student—as one whom he could hold conversation with above any other in his class.

Dr. Hudson having briefly returned thanks,

Dr. Gallard, Paris, presented the Association with copies

Digitized by Google

of some of his works. He had taken the initiative in France in introducing a system of legislation for certain classes of the insane (criminal lunatics) which caused a considerable amount of difficulty and trouble, and in one of his works he had proposed to establish a system of special asylums for criminal lunatics.

Dr. Carpenter, in accepting the present, said the Association had no library of its own, as they knew it was a travelling one, he did not know whether at present it was the intention of the Association to have one. On the part of the Council, therefore, he suggested that the books should be left in the library of the Queen's College, as a memento of their visit.

Thursday, August 7th.

The business of the day opened very pleasantly with a breakfast, given by the

Medical Temperance Association,

presided over by Dr. Norman Kerr, of London, to which a large number of the prominent members of the British Medical Association and the press were invited. The repast was excellently served by Mr. Phillips, of Cork, in Faulkener's Hall. Speech-making being the order of the day, it was not to be expected that the temperance movement would be allowed to suffer because the toasts were to be drunk in tea and coffee. On the contrary, much enthusiasm was shown, even at this early hour, and many exceedingly neat and flowery speeches followed, in which poetry bore no inconsiderable a part. Dr. Kerr set the ball rolling in a well-chosen harangue on the merits of temperance, tracing its history in connection with the Association from 1830, when Dr. Richmond, of Paisley, founded two of the earliest teetotal societies in Great Britain, to the present time. The able chairman's address was longly cheered, and was followed by a shorter one by Dr. Alfred Carpenter, of Croydon, who spoke highly of the modern innovation of coffee taverns, which he hoped would in a great measure be the means of lessening the evil of intemperance among the lower classes. Dr. O'Connor, the new president, next proposed a vote of thanks to the Council of the Medical Temperance Association, especially mentioning the name of Dr. Kerr for his excellent address and hospitality. Drs. Macnaughton Jones, Houldsworth, Ringrose Atkins, and Mr. Hart followed.

During the course of their remarks one or two speakers drew attention to a fresh non-alcoholic beverage, which had been introduced to the meeting by Messrs. Evans & Co., of Wrexham, under the name of Zoedone, which is a pure aerated water, with the addition of iron and the phosphates. Having ourselves tasted it we can honestly join in the praise bestowed by Drs. Norman Kerr and Carpenter, it is brilliant to the eye and pleasant to the palate, and being sent out by the manufacturers in champagne bottles has both the appearance and somewhat the taste of certain brands of champagne, with the further recommendation of being less costly and more useful medicinally than much which is sold under that name.

The next on the programme was the third general meeting of the General Association at 10 a.m., when Dr. Waters, of Chester, Chairman of the Committee, read the report, and moved the adoption of the following resolution :—

"That the Report of the Medical Reform Committee be received and adopted, and that the Committee be re-appointed as follows, with power to add to their number—Dr. E. Waters, Dr. Wilbraham Falconer, Mr. W. D. Husband, Dr. Alfred Carpenter, Dr. M. M. de Bartolome, Dr. C. Chadwick, Dr. E. Copeman, Dr. J. G. Davey, Dr. Balthazar Foster, Dr. T. W. Grimshaw, Rev. Dr. Haughton, Mr. H. Nelson Hardy, Dr. D. J. Leech, Mr. F. E. Manby, Mr. W. H. Michael, Mr. R. H. B. Nicholson, Dr. A. P. Stewart, Dr. W. F. Wade, Mr. C. G. Wheelhouse, and Mr. Ernest Hart."

This was carried, as was also a vote of thanks, by Dr. Falconer, of Bath, to Mr. Arthur Mills, M.P., for his efforts on behalf of the profession in Parliament.

Dr. Alfred Carpenter then read the Report of the Committee appointed at last annual meeting for promoting legislative restrictions for habitual drunkards, which was as follows :—

"Your committee are able to report that the Bill which Dr. Cameron introduced into the House of Commons last year, and which passed a second reading shortly before the Bath meeting, was not proceeded with. Dr. Cameron introduced it again early in the present Session, it passed through both Houses without a division, and it received the Royal Assent on the 3rd July, under the title of the 'Habitual Drunkards' Act, 1879.' The committee congratulate the Association upon the result, which, however, they can only consider as the first instalment of a more perfect measure. A strenuous effort should be made to bring into action some scheme by means of which the Act can be made effective. The committee are able to report that private efforts are about to be made for this purpose ; but they are of opinion that strenuous exertion should be made to procure the formation of a society which could elect a committee of management for the purpose of providing a residence fit for the reception of patients. A retreat should be established ; its superintendent should have no pecuniary interest in the detention of patients ; he should be a salaried officer, and responsible to the committee of management, who should appoint him. By this means accommodation could be provided for the poor as well as the rich, which can only be afforded by a properly-organised association, on the basis indicated by your committee. In conclusion, your committee, encouraged by the success hitherto achieved, are still aware that further efforts in the same direction will be required, and they ask, therefore, for their re-appointment as heretofore."

He moved that the following Committee be re-appointed :—Dr. Alfred Carpenter, Mr. Stephen S. Alford, Dr. G. F. Blandford, Mr. Wm. Cadge, Dr. J. W. Eastwood, Dr. B. Foster, Mr. W. C. Garman, Mr. John Gay, Mr. Carsten Holthouse, Mr. Charles Macnamara, Dr. H. Monro, Mr. G. W. Mould, Mr. R. H. B. Nicholson, Dr. A. P. Stewart, Dr. Farquharson, Dr. E. N. Vinen, Dr. Norman S. Kerr.

This was seconded by Dr. Bailey, and passed.

Dr. Wade moved the adoption of the report of the Scientific Grants' Committee, which he read. He moved that the following Committee be appointed :—Mr. G. W. Callender, Dr. Falconer, Dr. A. Carpenter, Dr. W. D. Husband, Mr. Alfred Baker, Dr. Lauder Brunton, Dr. C. Chadwick, Mr. T. B. Curling, Dr. Michael Foster, Dr. R. M'Donnell, Dr. W. Rutherford, Dr. Burdon Sanderson, Dr. Sharpey, Dr. Sieveking, Dr. A. P. Stewart, Dr. W. F. Wade, Dr. Waters, Dr. S. Wilks, Mr. C. G. Wheelhouse, Mr. Ernest Hart, which was also carried.

Mr. Savory was then called upon by the Chairman to deliver the Address in Surgery, which, on its conclusion, was received with universal and prolonged applause, and a vote of thanks to Mr. Savory was at once carried amidst ringing cheers.

The next business of the Association was one of the most interesting episodes of the meeting, the

Presentation of the Medal to Surgeon-Major Reynolds.

Dr. Carpenter, rising, said the honour had fallen to him to read the resolution passed by the Committee of Council. "That in consideration of the extraordinary professional services rendered by Surgeon-Major Reynolds, M.B., V.C., at Rorke's Drift, Zululand, South Africa, on the 22nd and 23rd January, 1879, by his constant attention to the wounded under fire, in consideration of his eminent bravery in voluntarily conveying ammunition across an open space under heavy cross fire, in consideration of the remarkable intelligence, coolness, and tact, evinced by Surgeon-Major Reynolds under circumstances of great danger, the gold medal of the British Medical Association, for distinguished merit, be, and is hereby, awarded to him." The recipient being still in Zululand, Surgeon-General Crawford, the head of the Medical Department in Ireland, would receive the medal on the part of Surgeon-Major Reynolds.

Surgeon-General Crawford, on receiving the medal, spoke

Digitized by Google

a few words of thanks in the name of Surgeon-Major Reynolds, and the interesting ceremony terminated.

The meeting then broke up into sections, the subjects and papers being as per our programme given in last week's number.

In the evening the annual dinner was given in the assembly rooms, and was served to the satisfaction of a large gathering by Mr. Tanner, of Cork. Dr. O'Connor occupied the chair, and was well-supported both by the members and visitors. The speakers were General Hamilton and Surgeon-General Crawford (for the army.) Dr. Husband and Mr. Goulding, M.P. (Houses of Parliament); High Sheriff Hall, and Dr. Alfred Carpenter (the Association); Dr. Sullivan (Queen's College, Cork); Dr. Falconer (the President); Dr. Balthazar Foster, Mr. Savory, Dr. McCavil Anderson, and Dr. Kidd (the readers of addresses); Mr. Cooper Foster (the Mayor Corporation and citizens of Cork); Dr. Andrew Clark, Dr. Sayre, Professor Charcot, and Dr. Weber Liel (our guests); Dr. Waters, and Mr. Ernest Hart (the *British Medical Journal*); Dr. Carpenter and Dr. Macnaughton Jones (the local Committee.) Of course it is beyond our space to chronicle the speeches, but this we may say that many of them were above the average of after-dinner orations, and the entertainment was apparently much enjoyed.

Friday, August 8th.

The final days' assembly was less interesting than those which preceded it, and requires but little space to record its proceedings. The fourth general meeting took place at half-past one o'clock, the sections having been held at eleven o'clock.

The first Report of the Hospital Out-patient Reform Committee was read and adopted.

Mr. Ernest Hart moved—"That a committee be appointed to consider and report whether it would be desirable to adopt the metric system in Great Britain and Ireland, and whether the British Medical Association should, by any means, and if so by what, facilitate its introduction." He said that the resolution did not commit them to any definite course, but merely to report upon the present difficulties that existed in regard to their correspondence with similar associations in foreign countries.

This resolution was carried unanimously.

Dr. Phillipson next proposed the adoption of the Report of the Committee on the Registration of Diseases, which was also carried.

Mr. Ernest Hart proposed the adoption of the Report of the Parliamentary Bills Committee, and in doing so spoke strongly against the abolition of the system of competitive examinations for vacancies in the Army Medical Department.

Surgeon-General Crawford defended the action of the Army Medical Department in remedying the system of competitive examinations when the number of candidates was below that of the number of vacancies.

The resolution then passed.

Various votes of thanks to the President and Council of Queen's College, to the Mayor and citizens of Cork, to the able President and Hon. Sec. were then passed by acclamation, and the proceedings terminated.

We intend devoting space to the exhibition of surgical instruments, drugs, &c., and to other addresses in our next.

The Sectional Address in Medicine, by the President of the Section, Dr. Andrew Clark, will be found in another column.

IRISH GRADUATES' ASSOCIATION.

The Annual Meeting of the Association was held on Wednesday, August 6th, at the Queen's College, Cork, Mr. W. MacCormac, F.R.C.S., President, occupied the chair.

Dr. Thompson, Hon. Sec., read letters from Dr. G. G. Paget, of Cambridge, and Dr. Daniell, of London, expressing their regret that they could not be present.

The annual report of the Council was read and adopted.

The President then rose to propose a resolution having reference to the new Irish University Bill and its relation to the present Queen's University. The resolution was in the following words:—"That this Association desires to record its opinion that the Queen's University in Ireland has proved a valuable institution, and that the *status* and value of degrees possessed by graduates of the Queen's University will be seriously impaired, should the proposed disestablishment be carried out in this instance, a course which would be unprecedented in this country, and that a copy of this resolution be forwarded to the Home Secretary." He said it was a hard case for them, who were graduates of the Queen's University, to lose their Alma Mater, and it appeared to him very questionable justice to deprive them of their rights under existing circumstances; if they thought with him he would ask them to vote for the resolution which he had proposed.

Prof. Jones, of the Queen's College, seconded the resolution. He said that occupying as he did a position in the teaching body of the Queen's University, of course it was perfectly obvious that he must regard the resolution now before them as a very important one. He agreed with every word that had fallen from the President with reference to the danger which at present threatened the graduates of the Queen's University, and also the value of the degrees of that University.

Dr. Jacob, of Dublin, said he felt himself bound in conscience to express his dissent from the resolution. He did not wish to enter into his reasons or to move an amendment, but in justice to his own conscience he could not sit there without expressing his disapproval of the terms of the resolution.

Dr. M'Keon, of Belfast, expressed his surprise that any one interested in the collegiate institutions of this country should say a single word against the resolution, or against the position of the Queen's University in Ireland.

Dr. Foster, of Birmingham, and Dr. Pierce also made some remarks.

The resolution was put and carried.

The Treasurer (Dr. Foster) reported that the funds of the Association were in a favourable condition. A balance remained over from last year, and there were due in the respect of the current year, seventy-eight subscriptions.

On the motion of Dr. Jacob, the treasurer's report was adopted.

Dr. Waters, of Chester, proposed a vote of thanks to the retiring President, Mr. William MacCormac, to whom he paid a very warm compliment.

Dr. Foster seconded the vote of thanks, which was passed.

Dr. Thompson proposed that the president for the next year be Dr. George Edward Paget, F.R.S., of Cambridge.

The proposition was seconded by Dr. Oaks, and passed unanimously.

On the motion of Dr. Vance, it was decided to hold two meetings next year, one in London on St. Patrick's Day, and one at Cambridge on the occasion of the annual meeting of the British Medical Association.

On the motion of Dr. Stewart, seconded by Dr. Hadden, a vote of thanks was passed to Dr. Foster, the treasurer.

Votes of thanks were also passed to the Council of the British Medical Association, and to the President and Local Reception Committee, and the Honorary Local Secretary for their assistance to the Association.

Dr. Stewart gave notice that at the next general meeting of the Association he would bring forward a resolution relative to the name of the Association.

THE DINNER.

The annual dinner of the members of the Irish Graduates' Association took place at the Imperial Hotel, Cork, Mr. W. MacCormac, F.R.C.S.I. & E., &c., occupied the chair. Fifty members and guests were present.

The Chairman proposed the health of "Queen and Royal Family," which was drunk with acclamation.

Two other toasts followed—"Our Guests," responded to by Prof. Charcot, of Paris; Prof. Yandell, of Kentucky; and Dr. Johnstone, of Birmingham. "Our Elder Brother," the British Medical Association, responded to by Dr. Carpenter and Mr. Hart.

The Chairman's health having been proposed and duly honoured, the proceedings terminated.

Literature.

THE STUDENT'S GUIDE TO THE PRACTICE OF MEDICINE. (a)

A SECOND edition of Dr. Charteris's little manual on the Practice of Medicine has just issued from the press. It is very properly designated a book on the *Practice* of Medicine, for a scientific exposition of the *science* is not professed. The student is, however, furnished with a reliable epitome of matters relating to symptomatology and treatment, thus enabling him to recognise disease, and have a practical knowledge of the treatment suitable to the various diseases. Pathology, of which Dr. Charteris does not seem to have a high opinion, may be said to be comparatively ignored; and the *modus medendi* of remedial agents is not attempted to be explained. The second edition is somewhat bulkier than the first, forty new pages having been incorporated with the body of the work, and a chapter on "A Method of Performing Post-mortem Examinations," having been added by Dr. Foulis. A Glossary of medical terms used in the text is in like manner a valuable addition, and much care seems to have been taken with it. We regret to observe in this, the second edition, a few errors of the press, and one or two doubtful expressions, which Dr. Charteris will permit us to point out, *e.g.*, "cold effusions, in the treatment of *scarlatina anginosa* still remains," &c.; "precocity in walking and talking," is questionable English; "a rise of the thermometer," is dubious; and "the indications of treatment resolve themselves *into a brisk purgative* of calomel and colocynth, followed by a black draught," is not defensible. While the treatment recommended is, generally speaking, such as we would assent to, we differ from Dr. Charteris in his recommendation of large draughts of water, and of stimulating diuretics, such as acetate of potash, in the treatment of acute Bright's disease. What effect large draughts of water could have other than to increase vascular tension, embarrass the renal circulation, and provoke the transudation of albumen, it is difficult to see. As for his stimulating diuretics, he is in company with his colleague at the University, and it might seem presumptious to challenge this treatment, strange though it does appear. These are, however, small objections; the book is a commendable one. Symptomatology is succintly described, and the indications of treatment, generally speaking, perfectly reliable. The rapid sale of the first edition testifies to the appreciation of the book by the student. The second is a decided improvement on the first, and we have confidence and pleasure in recommending it both to the student and to the junior practitioner.

MODERN MEDICAL THERAPEUTICS. (b)

No one who carefully peruses this work can feel surprised at the demand for it. Edition after edition sells off with great rapidity. It is a work which is eminently suited for American practitioners, but still could be profitably consulted by busy men here. It contains nearly all the recent additions to therapeutical knowledge arranged in an orderly manner, so that the busy practitioner can lay his hand at once upon what he wants. The author says that "the effort has been made to exercise a judicious conservatism in regard to long-known and well-tried remedies, and to avoid admitting what is new simply because it is new;" and he seems to have carried this into execution very thoroughly. The plan of the author is to give the different diseases of the various systems of the body together; then under the heading of each disease to give the most recent views as to treatment and the action of drugs. Thus in apoplexy the use of croton oil, as advocated by Hughlings Jackson, is given; and of bromides, by Prof. W. A. Hammond, is related. Under the heading of Epilepsy will be found everything the practitioner can get in the present state of our knowledge as to the treatment of this terrible disease. The same can be said of headaches. Hæmoptysis, however, leaves something to be desired, and that is, that light which pathology can throw as to the different causes of the disease, and consequently the appropriate remedy in each case. The different causes and associations of hæmoptysis are not described and differentiated; and consequently the treatment is a jumble of astringents. Ordinary fluxionary congestion of the lungs, leading to hæmorrhage, is best relieved by full doses of sulphate of magnesia; while that rise of blood-pressure in the pulmonic circulation, caused by tension in the systemic circulation, is best treated by dilatation of the systemic arterioles by heat and depressants. This is a matter Dr. Napheys will do well to attend to in a future edition. Under the head of Diarrhœa we can find no allusion to the use of the cold bath in the summer diarrhœa of hot countries, described by Comegys and H. C. Wood. Again, in dyspepsia, nothing is said as to reflex dyspepsia, occasionally accompanied by vomiting, which is due to ovarian irritation, and cured by blisters over the ovary, and full doses of bromide of potassium and sulphate of magnesia. In speaking of the treatment of dropsy the author does not discriminate betwixt the different forms of dropsy, especially betwixt that which is cardiac and that of chronic Bright's disease, a point of no small importance in practice. Gout, as may be expected, is not fully treated in an American book. They have not been a rich people long enough to have much gout; that is in store for them. Still it is ungracious to point out the faults only of a work so useful as this must be. It should have an extensive sale among those members of the profession who are anxious to be abreast the times. But its perusal should be preceded by the careful study of the principles of therapeutics, as given in Milner Fothergill's well-known work on the subject, after which this work can be read with much advantage.

On the whole there is much in this work to recommend it to the working members of the profession, especially those who have not much time for extensive reading, and yet who aspire to be of all the service to their patients that lies in their power. To such men we can confidently recommend this work.

ATLAS OF HISTOLOGY. (a)

JUDGING from the first three numbers, this work promises to be of the greatest interest and value. Its purpose is to give a representation and a description of the tissues of man and other vertebrates as they are understood in the present day; and if the later numbers sustain the high standard of those already published this purpose will be most satisfactorily accomplished. As regards the illustrations, Mr. Noble Smith must be congratulated on his great skill in delineation; the plates appear both graphic and truthful. In the first part blood and epithelium are dealt with, and it will be noticed that Dr. Klein favours the belief in an intra-cellular network both in epithelial cells and in white blood corpuscles. In passing, we should take exception to "crinate" as the epithet to apply to the edge of altered red blood corpuscles. In the second, endothelium is first considered. Here several of the very excellent illustrations are taken from Dr. Klein's work on the "Anatomy of the Lymphatic System," and we have a full exposition of his views on the importance of germinating endothelium; while the fourth chapter, devoted to the subject of connective tissue corpuscles, is illustrated by some of the best drawings of the whole series. In the third part, fibrous elastic tissues, pigment cells, and cartilage, are described; and here some of the illustrations can hardly be considered so fortunate as those to which attention has already been called. On the whole, however, the work appears to be one which is likely to occupy a very important place amongst our English text-books, and is one which is highly creditable to those concerned in its production.

Correspondence.

ON THE UNITY OF POISON IN SCARLATINA, PUERPERAL FEVER, TYPHOID, DIPHTHERIA, ERYSIPELAS, ETC., ETC.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—As bearing on the points unity of poison, differentia-

Digitized by Google

tion of resultant symptoms, and that symptoms proceeding from the one poison may in some instances be so mild as hardly to be cognisable, I quote these words of Dr. Eigenbrodt from his Report on the attack of diphtheria in the Grand Ducal family of Hesse Darmstadt (*Brit. Med. Journ.*, Jan. 25, 1879):—"Diphtheria sometimes appears in so slight a form that the patients suffering from the affection do not feel themselves really ill, but merely indisposed; and that consequently they have no occasion to interrupt their usual occupations."

Dr. Morton, in his paper (*Medical Press*, July 23, 1879) on "The Diphtheria Outbreak of last Spring in N.W. London," says:—"There is no infectious disease so uncertain in its activity; and my own belief is that the two great sources of difficulty in tracing the fresh case to the parent one are *the very various degrees of severity* with which diphtheria occurs, and no less *various degrees of susceptibility* of different persons to the poison. I think the very mild cases, of which little or no notice is taken, are frequently the parents of well-marked ones. The common English grasses and weeds, as you find them sometimes on the top of some thinly-capped and wind-swept cliffs, are so stunted that you hardly recognise them, but transplanted to some moist and sheltered spot, they may give rise to [I would rather say, developes by a series of evolutions, or by the process of evolution, into] a luxuriant vegetation....Cases of diarrhœa are exceptionally met with, in years when there is no suspicion of Asiatic cholera, which are fatal, with symptoms that cannot be distinguished from those of cholera....What I wish to suggest is that diphtheria, cholera, and influenza *may be* specifically *the same with some much slighter indigenous complaints*, but have acquired elsewhere, in some more congenial soil, a luxuriance constituting them new and what florists call 'giant' varieties; which, however, merge again, sooner or later, into the native variety. If this could be established it would go far to clear up one—and not the least important—of the interesting questions concerning the essential nature of diphtheria and its relation to other diseases."

I think the answer to Dr. Morton's speculations is fully given in my papers on this unity, &c., question—answers which will correspond with the experience of every medical man who uses in this direction his powers of observation.

Dr. Wm. Thomson (*Brit. Med. Journ.*, March 8th, 1879, p. 348) says:—"No doubt a great deal of the discrepancy of opinion which has hitherto existed, and still exists, concerning the etiology of typhoid, is due to the *difficulty of diagnosing the many varieties* of the disease. Enteric (typhoid) fever is common in infancy, and thus many people, being protected by such an attack, not being susceptible, come into contact with typhoid patients without contracting it again. . . . the same equally applies to scarlet fever. In studying the subject we must bear in mind that *we have imperfect development of some of its usual phenomena;* arrest, or absence, of some of its specific anatomical lesions; differences in the history of its origin, according to the EVER-VARYING conditions under which it is *diffused.*"

Dr. J. Harley, on Saturday, June 28th, 1879, communicated to me the leading points in a case of diphtheria, which had been recently under his care at St. Thomas's Hospital, and in which tracheotomy had been unavailingly performed. At the post-mortem the intestines were examined, *and found to be in that condition which is always set down as pathognomonic of typhoid; the state of Peyer's patches was particularly characteristic of what is orthodoxically supposed to be peculiar to typhoid.*

Surely this is another score in favour of unity of poison—differentiation of resultant phenomena!

Yours faithfully,

G. DE GORREQUER GRIFFITH.

9 Lupus Street, Belgravia, London.

Novelties.

CALVERT'S SOLIDIFIED CARBOLIC ACID.

In order to prevent the danger of accidental poisoning by carbolic acid, Messrs. Calvert and Co., of Manchester, supply this valuable disinfectant in the form of solid tablets which are well calculated to fulfil the object for which they have been prepared. Owing to the colour, odour, and general appearance of these tablets they are not likely to be taken either accidentally, or for the purpose of committing suicide, whilst they can be conviently used in all the cases in which carbolic acid is employed as a disinfectant. We find that one tablet dissolved in about a quart of warm water makes a solution strong enough for the disinfection of drains, water-closets, sick rooms, infected linen, &c. One great advantage of this preparation consists in its being very portable, so that travellers and families going into lodgings at the seaside, or elsewhere, would do well to provide themselves with a small box of these tablets.

SWAN AND PROCTER'S PREPARATIONS OF OPIUM.

SINCE we received some specimens of these preparations we have had the opportunity of testing their efficiency in several cases in which it was very desirable to prescribe a narcotic sedative on the action of which we could depend. The *pulv. opii. rect.* we have not yet tried, but we have found the *tinct. opii. rect.* and the *liq. opii. rect.* to be very reliable medicines, and to have decided advantages over other preparations we have been in the habit of using. It is well known that the commercial tincture of opium varies very much in its strength, and that is one reason why the crude drug is often much more effective than a corresponding dose of the tincture. Swan and Procter's solution is not only a preparation on the uniform strength of which we can rely, but it has, in our opinion, a more sedative effect upon the system than that of the British Pharmacopœia.

University of London.—The following candidates have passed the first M.B. Examination:—

FIRST DIVISION.

Adeney, Edwin Leonard, Guy's	Lane, William, Guy's Hospital
Barron, Alexander, Owens Coll.	Laurent, E. A., Univ. Coll.
Batterham, John Wms., Westmin.	Lukis, C. Pardey, St. Barth
Bull, Geo. C. R., St. Mary's	Mortimer, J. D. E., Westminster
Buxton, D. W., Univ. Coll.	Pearce, Walter B.Sc. St. Mary's
Clarke, Ernest, St. Barth. Hosp.	Priestley, John, Owens College
Corbould, H. F., Charing Cross	Rhodes, Jas. H. A., Liv. Rl. Infir.
Crookshank, E. M., King's Coll.	Rice, Bernard, St. Barth. Hosp.
Cuff, R. E. G., St. Mary's	Rogerson, J. T., Owens Coll.
Dakin, Wm. Radford, Owens Coll.	Savill, T. D., St. Thomas's Hosp.
Fenwick, E. H., London Hospital	Stoddart, F. W. St. Thomas's
Fielden, W. E., Guy's Hosp.	Stonham, Thos. G., Lond. Hosp.
Harris, T., Manchester Sch. Med.	Wells, Alfred Ernest, St. Thomas s
Jefferson, Arthur J., St. Thomas's	

SECOND DIVISION.

Anderson, D. E., B.A., B.Sc. Univ. Coll.	Larmuth, Leopold, Owens College
Atkinson, J. M., London Hosp.	Maddison, W. T., King's College
Bayes, Frederick Thomas, Guy's	Maitland, A. D., Univ. Coll.
Blore, Isaac, Owens College	Meeson, A., Liv. Royal Infirmary
Boswell, John Irvine, Guy's	Northcott, Arthur, Univ. Coll.
Brown, J. G., Liv. Royal Infirm.	Prothero, Liv. Sch. of Med.
Clarke, W. J., Queen's Coll. Birm.	Robinson, F., Leeds Sch. of Med.
Currie, Oswald James, Guy's	Rogers, J. M'Donald, Mx. Hosp.
Daniell, Alfred, Edin. and Paris	Salmon, A. G., St. Barth. Hosp.

Second Division.—Birch, H. P., Brown, W. H., Dudley, W., Evans, W. A., Finney, R. C., Graham, W. P., Green, C. D., Hodgson, G. G., Hull, W., Jones, J. H., Lucas, C. A., Lynam, R. G., Maude, A., Oxnard, A. T., Pilgrim, H. W., Player, C. E., Pointon, J., Smallpeice, W. D., Stewart, A. H. L., Thomson, T., Votsey, C. B., Walker, A. W. H., Walters-Hope, E. A., Ward, A. A., Williamson, H. H.

Royal College of Physicians and Surgeons, Edinburgh.—Double Qualification.—The following gentlemen passed their first professional examination during the July sittings of the examiners :—

Edwin Simpson, Harry Albert Murphy, Edwin Douglas, Charles Pope, Dugald Christie, Frank Bernard Norris, George William Daunt, Mark Anthony Wardle, James Satterthwaite, Anthony Snowdon, Edmund McDonnell, Titus Helden Harwood, James Charles Bradshaw, Peter Dunlop, Francis Moore, Miles Wolfe Carr Partrige, Arthur Thomas Nunn, Francis Edward Ackerley, James William Thornton Gilbert, John Swatman Reynolds, John Arthur Cornett, Michael Joseph Collins, Abraham Llewellyn Reece, James Booth Clarkson, David William Johnston, Eugene Geary, Edward Evans, John Holt Marsh, William Lloyd Reade, Robert Greenwood Dempster, Alexander McDonald Westwater, Francis McDonald Swallow, Charles Samuel Gibbons, Frank Cheetham, John Otley, Richard Francis Walsh, Abercromby McBeath ; and the following gentlemen passed their final examination during July and August, and were admitted L.R.C.P. Edinburgh and L.R.C.S. Edinburgh :—William Crofts, Valbert Larcher, William David Sheppard, Frederick Dunbar Sutherland McMahon, John Joseph MacDonnell, Alexander Bowie, William Stevenson, Denis Quinlan, Robert William Anderson, John Henderson Brannigan, James Camac Smyth, Alfred James O'Hara, Thomas Harrop Roberts, John Paxton, Owen Lynch, Arthur Fredrick Wilkins, James Joseph Delahunt, Edward North, Angus Munro, Milbourne Luscombe Bloom Coombs, William Cotton Cornwall, William Henry Haley, Eleazar Davies, Marshall John Campbell, Humphry Haines, Phillip Durrell Pank, William Langford Pruen, John Stewart, William Ring, Miles Wolfe Carr Partrige, Egbert Williams, Anthony Snowdon, James MacMullen Bolster, Samuel Wallace, George Francis West, George Gibson Hamilton, James Ferguson Wyllie Clarke, William Dalziel, James Ronayne, Alexander Dryden Moffatt, Robert Huntly Campbell, George Skirving, Peter Slade Kendall, Robert Fawcett Maxwell, David Leslie Porter, Alexander McNaughton, Robert Dover Brunskill, Sarkis Thaddeus Avetoom, Duncan William Francis Chisholm, John Adolphus Burton, Edmund Seymour Bricknell, Charles Paget Hooker, Robert Joseph Kennedy, Joseph William Townsend Anderson.

Royal College of Surgeons, Edinburgh.—The following gentlemen passed their first professional examination in July :—

Alfred Ernest Bartrum, Saint John Colwood Bennett ; and the following gentlemen passed their final examination, and were admitted to licentiates of the College :—John Tubb Thomas, John Edward Hanson, William Doughty, John Edmond Fairlie, William Arthur Ormsby Roberts. The following gentlemen having passed the necessary examinations in July obtained the Diploma of Licentiate in Dental Surgery :—William Armston Vice, Leon Jablouski Platt.

University of Glasgow.—At the graduation ceremony on August 1st, referred to in our last, under the heading of "Scotland," the following degrees were conferred :—

Doctors of Medicine (M.D.)—Archibald Brown, M.B., Charles D. Hunter, M.B., John Hutchinson, M.B., Thomas Reid, M.B., Robert Sinclair, M.B., Arthur R. Waddell, M.B.

Bachelors of Medicine and Masters in Surgery (M.B. and C.M.)—Thomas B. Adams, William Allan, John A. Barton, Thomas B. Birchall, Peter Buchanan, John M. Cameron, Archibald K. Chalmers, Alexander W. Crawford, John Crawford, Peter H. Cunningham, Alexander Davidson, William S. Donald, John Duff, Neil Fullarton, Robert Hamilton, Mark K. Hargreaves, Edwin Haworth, Robert Lees, David Longwill, Robert Lyon, Henry S. Lyons, William M'Alister, Angus M'Aulay, James B. Mackenzie, William J. Mackenzie, Angus Macphee, William McVie, Arthur Mechan, Robert D. W. Mecredy, Dugald Mitchell, William B. Moir, Islay B. Muirhead, M.A., Daniel Mungall, Sambira Nandi, Charles Napier, William Nicol, William K. Peden, Charles Harry Pinck, Charles Pinkerton, Alexander Barr Pollock, William Pollock, Robert Porter, John M. Smith, Ralph D. Stevenson, George Storer, William Taylor, George F. Wickens, William R. Willis, James S. Wilson, John Neil Wilson, John M. Yair, Henry Yarrow.

Bachelors of Medicine (M.B.)—John Glaister, John Mackeith, John Sinclair.

Naval Medical Service.—The following list shows the candidates for commissions as surgeons in the medical service of the Royal Navy who were successful at both the London and Netley examinations, together with the number of marks in each instance.

	Marks.		Marks
A. G. P. Gipps	4,642	J. P. Clibborn	3,386
J. Hunter	4,407	W. G. Jack	2,990
R. A. Simpson	3,895	A. Emson	2,713
J. F. Donovan	3,494	R. E. Biddulph	2,377
R. McIvor	3,438		

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

DR. DOLAN is thanked ; the information will be useful to practitioners and students, and will be published in the issue following our Student's Number.

MR. COOK.—Thanks ; will be utilised in a future number.

A CONTRIBUTOR has not sent his name and address, his communication cannot receive attention without adherence to our rule.

INDIAN MEDICAL SERVICE.—The next examination for appointments in this service will be held on the 28th inst., and following days. The necessary forms must be obtained a week beforehand at the India Office, Whitehall, London, S.W.

MR. TRAFFORD.—Consult any qualified practitioner in your district; we never prescribe in these columns.

DR. T.—Probably the week after next.

MR. T. M. B.—See reply to Dr. T.

A SANITARIAN.—The first work is by Dr. Gordon ; the other by Dr. Wilson, Medical Director of the United States Navy.

HISTOLOGIST.—Not just now.

STUDENT.—The date is not yet definitely settled.

VACANCIES.

Carrick-on-Suir Union, Piltown Dispensary.—Medical Officer. Applications to the Secretary before Aug. 20. (See Advt.)

Chelmsford.—Medical Officer of Health. Salary, £300 per annum. Appointment for three years. Applications to W. W. Duffield, 96 High Street, Chelmsford, by Aug. 23.

County Asylum, Bristol.—Assistant Medical Officer. Salary, £100, with board. Applications to the Chairman before Aug. 20.

Hampstead, Parish of St. John.—Medical Officer of Health. Salary, £125. Applications to the Vestry Clerk endorsed "Medical Officer of Health," before Sept. 1.

Jersey General Dispensary.—Resident Medical Officer. Salary, £120. Duties to commence Nov. 1. Applications to the Hon. Sec. at the Dispensary.

Northampton General Infirmary.—Physician. Honorary. Applications to the Secretary on or before Aug. 26.

Queen Charlotte's Lying-in Hospital.—Resident Medical Officer. Salary, £60, with board. Applications to the Secretary 191 Marylebone Road, London, W., on or before Sept. 1.

Royal Free Hospital.—Junior Medical Officer. Board and residence provided, but no salary. Applications to the Secretary at the Hospital, Gray's Inn Road, W.C., before Aug. 19. (See Advt.)

Sheffield General Infirmary.—House Surgeon and Assistant House Surgeon. Salaries, £120 and £80 respectively, with board, &c. Applications to the Medical Staff before August 16.

Tyrone County Infirmary.—Lady Superintendent. (See Advt.)

Westminster Hospital.—Pathologist and Curator of Museum. Salary, £52. Applications to the Secretary on or before Sept. 13.

APPOINTMENTS.

BOOKEY, W. J. B., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Collatting and Clonegal Dispensary District of the Shillelagh Union, co. Wicklow.

FOX, C. N., M.B., C.M., Medical Officer, Medical Officer of Health, &c., for the Crossakeel Dispensary District of the Oldcastle Union, co. Meath.

FRASER, D. M., M.B., House Physician to the Liverpool Northern Hospital.

HAVELL, C. G., M.R.C.S., Resident Medical Officer to St. Mary's Hospital.

PAULLEY, J. N. L., L.R.C.P.Ed., M.R.C.S.E., Resident Accoucheur to the Queen's Hospital, Birmingham.

STRAHAN, M., L.R.C.S.I., Medical Officer to the No. 2 Dispensary, North Dublin Union.

WINCKWORTH, C. E., L.R.C.P.L., M.R.C.S.E., Medical Officer for the Shefford District of the Biggleswade Union.

Births.

DAWSON.—On Aug. 7, at Queen's Gardens, Brighton, the wife of R. Dawson, M.B., of a son.

OVENS.—On Aug. 2, at Woodville, Gortatica, co. Kerry, the wife of J. C. Ovens, F.R.C.S.I., Surgeon-Major late 5th Dragoon Guards of a daughter.

WOODS.—On July 31, at Monaghan, the wife of Wm. Woods, L.R.C.S.I., of a son.

Deaths.

CARR.—On July 18, at Newcastle-on-Tyne, Charles Carr, M.R.C.S.E.

ELLIOTT.—On Aug. 3, at Cathedral Square, Waterford, John Elliott, A.M., M.B., aged 76.

FOSTER.—On Aug. 2, at Collumpton, Devon, James Murray Foster, F.R.C.P.Ed., F.R.C.S.Ed.

LEAHY.—On Aug. 3, at his residence at Killarney, Edward Leahy, M.D., aged 63.

MANING.—On July 23, at Derby, Herbert Stanley Maning, L.F.P.S.G., aged 27.

SYMES.—On Aug. 5, at Bridport, Dorset, George Symes, M.D., aged 81.

WARE.—On July 25, at Southampton, James Richardson Ware, aged 79.

IRISH POOR-LAW INTELLIGENCE.

LIMERICK DISPENSARY.

CERTIFYING OF LUNATICS.

In reply to a question to the Local Government Board from Dr. T. Gelston, the following letter was read :—

Local Government Board,
Dublin, 8th July, 1879.

Sir,—I am directed by the Local Government Board for Ireland to acknowledge the receipt of your letter of the 4th inst., inquiring whether it is the duty of a dispensary medical officer to visit on a red ticket a lunatic who is able to attend at the dispensary, and to fill the usual form for the admission of such persons to the District Lunatic Asylum ; and in reply I am to state that the 9th section of the Medical Charities Act enacts that it shall be the duty of the medical officer to afford medicine and advice, or to attend all poor persons provided with a ticket issued by any authorised person ; and it points out the course to be pursued if such person is not a fit subject for dispensary relief.

Every case must be determined on the special circumstances attending it, and their effect can be most properly determined by the Committee of Management of the district, to whom the facts would be known.

By order of the Board,
W. D. Wodsworth,
Assistant Secretary.

It will be observed that the Local Government Board gives no answer to Dr. Gelston's question, whether the dispensary medical officer must "fill up the usual form for admission to the lunatic asylum?" There is, in fact, nothing whatever to compel a dispensary medical officer to certify a lunatic without pay, and we hope that it will not be done except the circumstances compel.

DUNDALK UNION.

REDUCTION OF SANITARY SALARIES.

The Chairman read the following letter :—

"Local Government Board, Dublin,
"27th June, 1879.

"Sir,—The Local Government Board for Ireland acknowledge the receipt of the minutes of proceedings relating to the proposed reduction in the salaries of certain officers of the union, in which the committee state that they are of opinion that in the case of existing officers whose salaries have been increased since their appointment mainly on the ground of the increased cost of living, the guardians are not acting unfairly towards them and are strictly within the rights of reducing their salaries under the altered state of affairs, and that the decision of the guardians should be maintained ; and with reference to the resolution adopting the report of the committee to the above effect, the Local Government Board desire to state that they have given the matter due consideration, but that they see no reason to alter their views as expressed in the letter of the 23rd ultimo ; and they must therefore decline to give their consent to the reduction of the officers' salaries proposed by the board of guardians.

"By order of the Board,
"B. Banks, Secretary."

Mr. Jeffers—It does not matter what we have done. The Local Government Board had made up their minds.

Mr. O'Hagan—You are right, Mr. Jeffers ; I perfectly agree with you that there is no use going on with the case as far as the Local Government Board is concerned. I am in favour of bringing it under the notice of the House of Commons.

The subject was allowed to drop.

CARRICK-ON-SUIR UNION.

REMUNERATION TO MEDICAL OFFICERS.

The following letter with reference to the payment of £2 2s., which was allowed on last board day to Dr. T. Martin for performing Dr. O'Meara's duties at Piltown, during his illness, was read :—

"Portlaw, July 11, 1879.

"*To the Chairman, Board of Guardians, Carrick-on-Suir.*

"Sir,—Understanding that the board of guardians are willing to allow only two guineas a week for performance of the dispensary duties at Piltown, in the absence of Dr. O'Meara, I beg you will relieve me of them after Sunday next.—I am, sir, obediently yours,

"Thomas M. Martin."

It was ordered that a copy of the letter be sent to the hon. secretary of the Piltown dispensary district.

CARRICK-ON-SUIR GUARDIANS.

SUBSTITUTES.

"Local Government Board, Dublin,
"July 25, 1879.

"Sir,—The Local Government Board acknowledge the minutes of proceedings of the 19th inst., containing a resolution that in future when a dispensary medical officer is allowed leave of absence owing to illness, a sum not exceeding two guineas a week be allowed for his temporary substitute ; that if the services of a substitute cannot be procured for such remuneration, the medical officer be required to pay the extra sum incurred in having his duties thus temporarily discharged, and that these conditions be inserted in all future advertisements, inviting candidates for the office of medical officer.

Digitized by Google

"In reference thereto the Local Government Board desire to point out that the appointment of temporary substitutes for dispensary medical officers is provided for by article i, of the Dispensary Regulations, and it is for the board of guardians, on consideration of the circumstances of each case, to determine the amount of remuneration, if any, to be paid, subject to the approval of the Local Government Board.

"The guardians have, however, no legal authority to restrain the discretion of the guardians assembled at any future meeting, as to the rate of remuneration which a majority of the guardians present and voting at such meeting may think proper to allow in each case on its own merits.

"By order,

"W. D. WODSWORTH, Assistant Sec."

LIMERICK SANITARY AUTHORITY.

A MODEL EXECUTIVE.

READ Dr. Barry's report on the state of the sanitation of the city generally, and of the cellars in particular, the quantity, nature, number (126) of the cellars, which he considered exceedingly bad in almost every respect. In fact, the description of the cellar dwellings of the poor, which he gives in his report, is wellnigh indescribably bad, as unfit for the habitation of man, and never intended for such. They are nearly all without areas, except in a few cases, 73 of them are without a ray of light, many of them without ventilation; and except a few, all of them of a nature in the highest degree condemnable—in some of them families are in a horrible state of misery; and he computed about 500 persons in all to live in them.

Mr. Hastings said he never knew healthier or better people than lived in the cellars in his time. He did not know how these cellars could now be unhealthy when there were extremely healthy people in them formerly.

Ald. Synan agreed with Mr. Hastings. Huxters lived in those cellars—and they live very well.

Dr. O'Sullivan would always object to use food or provisions out of cellars such as those described in Dr. Barry's very exhaustive report, which he considered of the highest importance to the public.

Report referred to a sub-committee to investigate and report on.

Mr. Lenihan suggested that it should be an instruction to the committee to ascertain whether the average mortality is greater in the cellars than out of them.

CROSSAKIEL DISPENSARY.

AT a meeting of the Committee, held for the purpose of electing a medical officer to the district, two candidates presented themselves—Dr. C. N. Fox, of Killucan, and Dr. O'Reilly, of the Meath Militia. On a division Dr. Fox was declared elected by a majority of 12.

BALLINA DISPENSARY.

THE Local Government Board wrote approving of the appointment of Dr. Macaulay to act for Dr. Scott for a month, and of the remuneration proposed to be given.

It was stated that Dr. Macaulay had written to the Secretary of the Committee throwing up his appointment in consequence of the number of red tickets he was required to attend upon.

The subject then dropped.

The Ballina Dispensary Committee is always in the throes of labour about a medical officer. The whole population is billetted upon the dispensary doctor, and there emains no paying constituency.—ED. M. P. & C.

WATERFORD GUARDIANS.

CERTIFYING OF PAUPER LUNATICS.

THE Mayor called attention to a question which had arisen in connection with the duties of the dispensary doctors in reference to signing certificates in cases of lunacy. A man had gone out of his mind. He had been visited by Dr. Cutlar, who, unfortunately, did not see his way to signing a certificate of lunacy for him without a fee, as he said it was not any part of his duty to do so. The question then arose as to what were the duties of the dispensary doctors in such cases. The man was not dangerous, and had not attempted his life, but a constant watch had to be kept on him.

Mr. Newell—If he is dangerous the police should bring him before the magistrates, who can compel the doctor to examine the man, and give a certificate, for which they can give any fee they like up to £2.

Mr. Fisher held that under the Poor-law Act the doctor was bound to certify in a case like the present without any fee. It would be well to state the facts to the Local Government Board, and ask their opinion on the duties of the medical officers of the dispensary districts. The patient was not a dangerous lunatic at present, but they could not tell when he might be so. The doctor should give a certificate, and then he might apply to the proper authority for his fee.

The Mayor—Dr. Cutlar says he is not bound to certify for lunacy without a fee.

Mr. Fisher considered the doctor was bound to give the certificate.

The Clerk said the Medical Charities Act clearly defined the duties of the dispensary doctors. They were bound to examine any dangerous lunatic and give a certificate if necessary. They are also bound to give to the guardians, committee, or relieving officer a certificate of the state of health of any patient they attend on a ticket. Here, however, the certificate was wanted for the admission of a patient to a lunatic asylum, which made the case different. The proper course would be for the police to take charge of the case and bring it before the magistrates, who would commit the person to the asylum, awarding the doctor any sum not exceeding £2 that they thought fit for the certificate.

Mr. Clampett—That is where the doctor is not a dispensary doctor.

The Clerk—For any doctor.

Mr. Clampett—I think that in the case of lunatics the dispensary doctor is bound to give a certificate without a fee.

Mr. Fisher suggested that Dr. Cutlar be called on to visit the patient, and give a certificate as to his state of health.

The Mayor said he would have given a certificate himself before, both as a magistrate and a medical man, but that the case was in Dr. Cutlar's hands. However, he would now have the case brought before him sitting as a magistrate, and give Dr. Cutlar an order to sign the certificate.

The Clerk—That is the best way. If he is a dangerous lunatic the guardians have nothing to say to him.

These proceedings raise a very important question, as we believe Dr. Cutlar was perfectly right in the belief that it was no part of his duty to certify a pauper lunatic. In fact, strange as it may appear, it seems to us that there exists in Ireland no legal provision whatever for the examination and certifying of a harmless pauper lunatic. In England that duty is performed by the Poor-law medical officer, and paid for by a separate fee entirely apart from his ordinary duties. By the fifteenth section of the Medical Charities Act, Irish dispensary doctors are required "to examine and certify under the statute in that behalf any *dangerous* lunatic brought before a justice of the peace

Digitized by Google

within his district *when summoned by such justice so to do*" By the 30th and 31st Vict., cap. 118, sec. 10, the term "dangerous" is defined to mean "a person apprehended under circumstances denoting a derangement of mind, and a purpose of committing some crime for which, if committed, such person would be liable to be indicted;" and by the 14th section of the 38th and 39th Vict., cap. 67, the medical officer is authorised to demand from the guardians a fee of £2 for such examination and certificate, if the magistrates grant him an order to that effect.

The official regulations say not a word of any such duty in the case of harmless lunatics, and, on the whole, it seems certain that though the dispensary doctor is bound to visit a lunatic on a red ticket and prescribe for his cure, and even report the state of his health to the guardians, he is under no obligation to give a regular certificate for his restraint, and—judging from English precedent—he should be paid a special fee for doing so. We think that the best course which medical men can pursue is to ascertain whether the relations of the lunatic are willing to pay for the certifying, and if they be unwilling or unable to do so, to notify to the guardians that he will expect to be paid in all such cases, and will not sign any certificate unless he be. This subject was brought forcibly under the notice of the Poor-law and Lunacy Inquiry Commission last year by the Irish Medical Association, and we hope for some satisfactory legislative settlement of the matter.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF JULY, 1879.

JULY 1st.—O'Donnell, William; 4 Margaret Place, Dublin; Lic. R. Coll. Surg. Irel. 1879, Lic. 1879 and Lic. Mid. 1878 K. Q. Coll. Phys. Irel.

2nd.—Grey-Edwards, Henry; Bangor, N. Wales; M.B. 1879, and B.Ch. 1879 Univ. Dub.

4th.—McCreery, Benjamin Thomas; Provincial Bank, Fermoy, co. Cork; M.B. 1879 and B.Ch. 1879 Univ. Dub., Lic. Mid. K. Q. Coll. Phys. Irel. 1879.

4th.—Hodges, Ralph Wm.; General Hospital, Queenstown, co. Cork; Lic. Apoth. Hall. Dub. 1879.

5th.—Carmody, Patrick Joseph; 1 Carr Street, Limerick; Lic. R. Coll. Surg. Irel. 1877.

7th.—Elliott, James May; Rathfirland, co. Down; Lic. R. Coll. Phys. Edin. 1876, Lic. R. Coll. Surg. Edin. 1876.

7th.—Murray, Andrew; 76 Eccles Street, Dublin; M.B. 1879 and B.Ch. 1879 Univ. Dub.

11th.—Fitzmaurice, Wm. Henry; Dunmanway, co. Cork; Lic. R. Coll. Surg. Irel. 1878.

15th.—Macnamara, John Wm. Unthank; Corofin, co.; Lic. R. Coll. Surg. Irel. 1878, Lic. Apoth. Hall. Dub. 1879.

15th.—Macnamara, William; Corofin, co. Clare; M.D. 1878 and M.Ch. 1878 Q. Univ. Irel.

15th.—Younge, Geo. Harrison; Rathdowney, Queen's County; Lic. R. Coll. Surg. Irel. 1879, Lic. 1879 and Lic. Mid. 1879 K. Q. Coll. Phys. Irel.

16th.—White, Vincent; 21 Broad Street, Waterford; Lic. R. Coll. Surg. Irel. 1878, Lic. 1879 and Lic. Mid. 1879 K. Q. Coll Phys. Irel.

18th.—Banks, Henry; 1 Kenilworth Square, Rathgar, co. Dublin; Lic. R. Coll. Surg. Irel. 1878, Lic. K. Q. Coll. Phys. Irel. 1879.

18th.—Crowley, Joseph; Bandon, co. Cork; M.D. 1879 and M.Ch. 1879 K. Q. Coll. Phys. Irel.

21st.—Magill, Charles; Dundrod, Crumlin, co. Antgim; M.D. 1879 and M.Ch. 1879 Q. Univ. Irel., Lic. Mid. K. Q. Coll. Phys. Irel. 1879.

25th.—MacMunn, John Auchinleck; Warrenpoint, co. Down; M.B. 1879 and B.Ch. 1879 Univ. Dub.

29th.—Dormer, Thomas; Patrick's Hill, Cork; M.D. 1879 and M.Ch. 1879 Q. Univ. Irel.

29th.—Day, James Dunne; 2 Rosstrevor Terrace, Orwell Road, Rathgar, co. Dublin; M.B. 1878 and B.Ch. 1878 Univ. Dub.

30th.—Mitchell, Robert; Ballydugan House, Toome Bridge, co. Antrim; M.D. 1879 and M.Ch. 1879 Q. Univ. Irel.

31st.—Ogden, Wm. Henry; 25 St. Mary's Road, Dublin; Lic. R. Coll. Surg. Irel. 1878, Lic. K. Q. Coll. Phys. Irel. 1879.

The following was restored to the Register per order of General Medical Council of the 16th July, 1879, viz.:

Corbett, Thomas; 20 Ship Gate Street, Londonderry; Lic. Fac. Fac. Phys. and Surg. Glas. 1824, Lic. Apoth. Hall Dub. 1830.

The following names have been erased from the Register of the Branch Medical Council of Ireland during the month of July, 1879, pursuant to the 14th section of the Medical Act, 1858, in consequence of no reply having been received to several letters of application, viz.:—

Heath, Edward; Fleet Surgeon, R.N.
Hope, George; 8 Dawson Street, Dublin.
Hyde, Robert; Longford.
O'Reilly, Thomas; Kilkenny.
Power, Pierce George; Eglinton Asylum, Cork.
Rogers, John; formerly in Naval Medical Service.
Wheeler, Edwin; formerly in Naval Medical Service.
Lewis Charles; Knottingley, Yorkshire.
Hall, John Henry Wynne; 118 Wandsworth Road, London.
Nolan, James Joseph; Ballina, co. Mayo.
Kehoe, Joseph Richard; formerly Medical Department of the Army.
O'Grady, Thos. John; 26 Wexford Street, Dublin.

CORRESPONDENCE.

THE IRISH DRUG SYSTEM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—You have more than once of late referred to the system by which medicines are supplied to the dispensaries of the Irish unions. Tenders are advertised for, and the lowest contract price accepted. You have clearly pointed out the danger of this resulting in inferior medicines being sent in to the contractors. I would add to this, that in consequence of most of the dispensaries having earthen floors, and not being very abundantly supplied with fuel, the medicines are constantly in a state of damp for several months of the year, so that it is impossible to keep extracts, pill masses, or, indeed, anything that is not in a stoppered bottle. Practically, therefore, the pharmacopœia of the dispensary has to be limited to tinctures, Epsom salts, castor oil, and a few other articles not liable to be affected with damp. To remedy these evils, I applied a few months ago to my committee for a supply of the pearl-coated pills made by J. Richardson and Co., of Leicester, and I have found them so useful that I have sent the guardians a selected list of these pills and of some other specialties of the Leicester firm, which are very convenient for keeping and dispensing. These, along with Howard's quinine and bicarbonate of potash, and the vaseline of the Chesebourgh Manufacturing Company, the guardians have agreed to offer for contract along with the usual list of drugs recommended by the Local Government Board, the condition being annexed that all the articles in the special list must be enclosed in tins or bottles sealed by the label or trade mark of the respective manufacturers.

It is evident that the medicines shall come from a reliable source, and shall be in the form most suitable for keeping and dispensing.

I believe that an actual saving will be the result of the plan I now suggest. When I used to order pill masses, they either got mouldy, or absorbed so much moisture that they more resembled treacle than anything else, possibly because that was their principal ingredient, and so they had to be thrown out, and a fresh supply ordered. Now, the pearl-coated pills keep for months in their stoppered

Digitized by Google

bottles. I find that about 28 varieties of pills, and 22 specialties, are amply sufficient for all practical purposes. I shall be glad to give further information to any dispensary medical officers who are disposed to bring the subject before the guardians of their respective unions.

Of course a medical officer can order whatever he considers necessary for the poor of his district, even though it be not contracted for; but where the intention is to get the chief supply for the dispensary in this way, it would be the wisest course to have the articles included in the contract, as otherwise the medical officer would be placed in an unpleasant position between the guardians and the contractor, and the former would ask the contractor to certify that the prices were reasonable.

I am yours, &c.,

ALEX. WALLACE.

Parsonstown, 26th July, 1879.

QUARTERLY RETURN OF BIRTHS & DEATHS IN IRELAND FOR THE QUARTER ENDING JUNE 30, 1879.

THERE was registered in the 798 Registrars' Districts in Ireland an annual birth-rate of 27·3 in every 1,000 of the estimated population.

In England the birth-rate represented was 35·2, and the mortality 21·1 per 1,000.

The birth-rate in Ireland was somewhat under the average for the June quarter, and the death-rate considerably in excess. The increased death-rate was due to the severe wintry weather, which led to great mortality from diseases of the respiratory organs, especially amongst the aged. The deaths from the eight principal zymotic diseases only equalled an annual mortality of 1·6 per 1,000 of the population.

From returns furnished by the Local Government Board, it is seen that the average weekly number of persons in receipt of poor relief was greater than in the second quarter of 1878, and also in excess of the average number for the June quarter of the last ten years. An increase appears both in the number in workhouses and the number on out-door relief.

Deaths.—The deaths registered in Ireland during the quarter ended 30th June last amount to 28,115, affording an annual ratio of 21·0 per 1,000 of the estimated population, against an average rate of 19·1 per 1,000 for the corresponding quarter of the five years 1874-78.

The death-rate in Leinster was 24·0 per 1,000, in Munster 21·3, in Ulster 20·3, and in Connaught 17·3.

The extremes of the county rates are 15·2 per 1,000 in Sligo, and 32·4 in Dublin. Of the intermediate rates the five highest are:—Westmeath 25·0 per 1,000; Limrrick, 21·2; Kilkenny, 23·5; Waterford, 22·7; and Carlow, 22·3; and the five lowest, Mayo, 16·3; Kildare, 17.4; Roscommon and Tyrone, each 17·7; and Galway, 18·0.

Health of the People.—The fatal effects of the cold, wet, variable weather which distinguished the past quarter in Ireland, are seen in the comparatively heavy mortality recorded in all parts of the country. The deaths in the March quarter were in excess of the number registered in any corresponding period since registration was established in Ireland, in the year 1864, and a similar result is afforded by the returns for the last three months, by which it is found that the deaths exceed those of the June quarter of any of the fifteen years referred to. As in the March quarter, the greater part of the increased mortality was amongst persons aged 60 years and upwards. Phthisis, bronchitis, and pneumonia were very fatal, but it is satisfactory to find that deaths from zymotic diseases of a preventible nature were, on the whole, below the average, and that there was no remarkable prevalence of any of these affections.

The "Registrars' Notes" treat, for the most part, of the sanitary condition of the respective districts; some record improvements, while in others the writers disclose defects in water supply, sewerage system, and general sanitary arrangements which call for immediate remedy—for example, the Registrar of Bellaghy district, Magherafelt Union, remarks, "No improvements in sanitary condition of the district. It is very hard to get the people to understand the danger of having cesspools, manure heaps, &c., at their very doors, still harder to keep them from drinking dangerous water; for instance, one well in this village was condemned by Public Analyst (twelve months ago) as utterly unfit for use, and yet, the well still remains open, the people still use the water, and all the reporting, &c., went for nothing."

The Registrar of Dunkineely writes—"the great desideratum—a due supply of pure water is not readily accessible to the inhabitants of the town of Dunkineely."

The Registrar of Annamoe, Rathdrum Union, again feels obliged to complain of the want of water in Lara and Roundwood; he says, "notwithstanding the great want of pure water in Lara and Roundwood, nothing has been done in that direction, although I have reported the matter many times to the local authorities; the expense of bringing a good supply of pure water into the centre of Lara would be almost *nil*.

As heretofore, many registrars deplore the existence of manure heaps and cess-pools in proximity to dwelling-houses, but some point out the difficulty of dealing with this evil owing to the want of proper accommodation around the houses of the poor. The Registrar of Whitechurch District, Dungarvon Union, referring to this subject remarks—"Cess-pools reported years ago remain in the same state, the sanitary authorities being powerless to compel the poor to be cleanly, who from want of rere accommodation must deposit night soil, filth, and all refuse matter in holes now filled with putrid water, and which recently contained manure, in front of their wretched cabins. The district abounds now with this class of nuisance, but I cannot see the remedy for its abatement until suitable dwellings with yard and ashpit in rere be provided."

Diseases.—The number of deaths returned by the registrars as having resulted from the principal zymotic diseases is 2,349, or 8·4 per cent. of the total deaths registered, and equal to 43·8 in every 100,000 of the population. This number is 667 under the deaths from the same causes in the corresponding quarter of 1878, and 109 under the average mortality for the second quarter of the three years 1876 to 1878.

Small-pox.—The deaths from small-pox which, in the March quarter, amounted to 334, fell last quarter to 153, all of which except 2 (1 in Ballymena Union, and 1 in Londonderry Union) occurred in the province of Leinster, the chief mortality having been in the two Metropolitan Unions, where 126 of the deaths took place. The remaining deaths from this cause were 16 registered in Rathdrum Union, 4 in Rathdown Union, 2 in Tullamore Union, and 1 each in the Unions of Gorey, Athy, and Enniscorthy. The Registrar of Athy District says that the fatal case of small-pox in that district was imported from Dublin.

(To be continued.)

TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medica Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. JACOB, at the Dublin offices of this paper.

CONTENTS.

ABSTRACT OF THE ADDRESS IN SURGERY.

By WILLIAM S. SAVORY, F.R.S.,

Surgeon to, and Lecturer on Surgery at, St. Bartholomew's Hospital.

ON THE PREVENTION OF BLOOD-POISONING IN THE PRACTICE OF SURGERY.

WHEN honoured by the invitation of your Council to give this year the Address in Surgery, I had to consider on what subject I might venture to speak to you, I could not help regretting that one had not been chosen for me. I was embarrassed by the range of choice. Working as I am at surgery in general, there is no particular subject on which I am entitled to speak with especial authority; with any authority, indeed, beyond, or even equal to, that which many of those whom I address can claim. But then, on reflection, I could not doubt that, if the members of this Association had been called on to select a subject for this address, the majority, at least, would have chosen that which is, I think, not only in itself the first and largest in surgery, but also the one which of late years has occupied the attention of most surgeons far more than any other, and concerning which the most opposite opinions are entertained by those who have the fullest opportunities of studying it.

Need I say that I refer to the subject of Blood-Poisoning and its prevention? I think I am speaking advisedly when I call it the largest and the first; for it is not only an evil spread over the whole field of surgery—in what class of cases is its deadly presence unknown? but it is, if not the sole one, almost beyond comparison the chief evil which waits upon the surgeon's own work. It seeks its quarry not only in disease and accident, though here might be found scope enough for its powers of destruction; but it hovers over every operation, and by its fell swoop can destroy the best work and fairest promise of the surgeon. Yes; truly it has been the scourge of surgery. Is it so still? Would I could say it was altogether a thing of the past—of history only; that we are able now to cast it out. No; I cannot state this, When will some successor of mine in this honourable but responsible position be able fairly to affirm so much? But this I may say, that of late a vast amount of the best work has been done in this direction; of work so worthy that if the demon has not been altogether exorcised, in its power of mischief it has been so trodden under foot that now, when it moves among us, we are startled as by some strange thing. Let those who think my language overcharged look at the records of surgery in the last generation only, and in this they will see somewhat of the good which has been wrought—but a fraction of it; for it is only in our own time that anything like an accurate record has been kept of the number of lives thus destroyed. How many lives were so sacrificed in former times no one can tell, for the nature of the mischief being then unknown, its fatal work was set down to various other causes. It is only in time within the reach of many of us that its presence came to be recognised with sufficient distinction to have a name; and surgeons, you know, are not slow to find names for new things, whether real or actual, or mere imaginings. Yes, surely the chief triumph of this era of surgery is the successful war it has waged with blood-poisoning in all its various forms.

To avoid risk of confusion, let us consider for a moment what is to be understood by the term blood-poisoning. I shall employ it in its comprehensive sense, to express the sum of the effects produced by the introduction of matter changed by the action of septic poison into the blood. By septic poison I understand matter capable of producing or promoting putrefaction. This septic matter is thus, of course, separated from all inorganic and vegetable poisons commonly so-called, and by its effects, at least in the economy, from those zymotic poisons which produce such diseases as small-pox, scarlatina, measles, and the like. But I need hardly add that I include in this view not only the affections called pyæmia, septicæmia, ichorrhæmia, and so on, but some others which perhaps would not be so universally accepted to be within the pale, as, for example, erysipelas, certain forms of erythema, boils often, and carbuncle, and some other affections more vague and transient, which, perhaps, I need not now further particularise, for on this subject I have already spoken else-

Digitized by Google

where. Of course, I do not forget that concerning the pathology of erysipelas, for instance, contrary views are still entertained. For my part, I consider it to be fairly well established that erysipelas is due to some infection of the blood; that it is the result of some form of blood-poisoning, and very closely allied to the affections called septicæmia and pyæmia. Nor shall I now trouble you with any discussion of the relation of the affections called septicæmia and pyæmia to each other. But, in order to be clear, it is as well to say that I do not think there is any evidence at all sufficient to show that these affections are different in kind or in nature. So far as I can see, they differ only in degree—a degree probably determined, at least chiefly, by the intensity of the poison which operates. I can find no reason for assuming a difference in the nature of the poison itself. For the grounds of this opinion I must refer you to former papers on the subject.

The cause, then, of the blood-poisoning of which I speak is the introduction of putrid matter to the blood. I say its introduction, for if it ever originates in the blood itself, such an origin is at present beyond research. We know nothing of it. All we do know is, that it may be introduced from without. The current belief—may I say the established fact?—is, that the agents of putrefaction exist in the form of solid organic particles, some so minute as to be beyond the range of the highest powers of the microscope, which float freely in the air, and are now commonly called germs, and which abound in decomposing organic matter of various kinds; notably, and this is of chief interest to us, in decomposing animal fluids.

Let it be observed, however, in passing, that although the germ-theory in its present form is of very modern growth, the belief that the admission of air to recent wounds is in some way injurious is not a new one. It extends at least beyond the era of the introduction of subcutaneous surgery, which is founded on it.

Now it is necessary for me, in order to avoid being misunderstood in what I have to say hereafter, to state thus much; but I do not propose to enter further into, to disturb the vexed questions that arise therefrom. I am considering the subject now only from a clinical point of view. Therefore, I turn from any farther inquiry into the more precise nature of these septic particles. In what sense, for instance, they are entitled to be considered alive need not trouble us here, or whether they are more akin to vegetable or to animal life. That they are organic, and possessed at least of the fundamental attributes of living matter, seems proven by their behaviour, and by some of the tests that we can apply to them. It is enough for us that they are septic; that they can produce and promote putrefaction; and further, that fluids so changed by them may provoke those terrible effects which are only too well known as blood-poisoning. I speak thus of the fluid which poisons, saying changed by, rather than charged with, bacteria or their germs, according to evidence; but I need not now consider this question. You will remember that it was discussed in a masterly manner in 1878, by Dr. W. Roberts, in his Address on Medicine. Neither have I now anything to say concerning the particles of matter at present called bacteria. Every one knows how they are prone to abound when putrefaction and kindred changes occur. For the most part, I suppose their presence may be regarded as the signal that such changes are in progress; but the exact relation they hold to such changes is at present with many a vexed question, and it is not necessary now to disturb it.

I have only one further remark to make on this portion of my subject. I have said that we have no knowledge that these mischievous particles ever originate within the blood. We do not know that when fluids so changed by them find an entrance from without, they are prone to provoke grave mischief. But we also know that such fluids, potent for the gravest mischief, may be produced within the body, deep among the tissues, far away from any chance of direct communication with the air, and this without previous wound or injury of any kind. Upon the passage of such matter into the circulation, the most fatal form of blood-poisoning may supervene. This significant fact, which is beyond question, has been of late strangely set aside, I would almost say wilfully overlooked, in very much of what has been written within the last few years; a fact significant, indeed, in a twofold sense. But to this I shall presently return.

It will be admitted, I trust, even by those who unreservedly accept what is known as the germ-theory, that I have not been in any way unfair in what I have thus said on the subject. Some, I know, would not go so far as I have gone, but I am anxious not to do injustice to this view. But now I turn to another side of this great subject: a side which throughout the discussion has been curiously lost sight of; which, so far as I know, in the vast amount that has been said and written, has been almost entirely ignored. If the germ-theory in its past and present state contained the truth, the whole truth, and nothing but the truth, what possible explanation is to be given of that which is witnessed daily and hourly—the kindly repair of exposed wounds? I will venture to say that any one who had no clinical experience, but who accepted all that he could read on the germ-theory, would inevitably come to the conclusion that to expose any wound unguarded to the atmosphere would be to seal the fate of the patient. But what is the fact? Who requires to be informed? Then is it not clear that the whole truth has not yet been told? Nay, further still, not only are exposed and unguarded wounds constantly to be seen in healthy process of repair, covered with secretion which presents no evidence of putrefaction, but wounds are sometimes seen bathed in fluid, which, if injected into the blood, would forthwith produce all the effects of blood-poisoning in the most intense degree. And yet farther: not only may such fluids lie in contact with open wounds without provoking any evidence of mischief, but a collection of the foulest fluid, in a state of the most active putrefaction, may be pent up in a closed cavity under considerable pressure; as, for example, in an anal or pharyngeal abscess or in an abscess around dead bone—I say a collection of matter large enough and poisonous enough to destroy a host of persons, if passed into the blood, may remain thus pent up in the body for a long period without any visible disturbance of the general health. It is obvious, then, that the contact of wounds and raw surfaces with even putrefying fluids is not always enough, for this is seen continually without evil effects. They must be transmitted to the blood. I hardly know what would become of the practice of surgery if this were a matter of course. In point of actual fact—a fact second in importance to none in surgery, but which it is the fashion just now resolutely to ignore—I say, in point of fact, it is very far from it. The transmission of such fluids, when they are present, is the exception, not the rule. Now, here again I am content to take the fact itself; and I do not propose to enter, at all events at any length, into any attempt at explanation. I do not think, however, that we are altogether in the dark. All wounds, except the most recent, when tolerably healthy, are covered, as we all know very well, by a newly formed delicate structure sometimes called granulation-tissues; sometimes presenting other but kindred forms; but which in any case constitutes a continuous layer interposed between the blood and whatever may be on the surface; and it seems to be pretty clear that this animal membrane has, like similar structures of the class, the property of separation; that it has the power of allowing the transmission of certain substances and of rejecting others, and that upon this simple action of dialysis health and life very often depend. I say this explanation has been made reasonable by observation and experiment; but whether it be wholly or partially true or not, the fact—the vital fact—which it attempts to explain remains. Pause, if only for a moment, to think of it: a fluid all-potent for mischief, intensely poisonous on the one side

Digitized by Google

the blood, to which if it gain access follows destruction on the other, and a very thin, very delicate, most fragile membrane only intervening! Truly enough, to the patient ignorance of this is bliss; and surgeons just now talk, and write, and practise, as if it were folly to be wise.

But such terrible transmission is sometimes effected, and there is blood-poisoning. It remains, then, to inquire under what conditions the poison can gain entrance to the blood. I think the clinical study of this subject impresses us with some striking facts. First of all, this mischief is least likely to happen in healthy wounds during the process of repair; and, when it does occur, it is either in a wound unhealthy in character or flagging in action, or in one so recent, or in which the process of repair has been so delayed, that little or no new and healthy tissue has been produced on the surface. In other words, when the newly formed tissue is healthy and entire, it is tolerably impregnable, and whatever interferes with its integrity gives the opportunity for mischief. I say the mischief is less likely to happen in proportion as the wound is healthy and repair is rapid; but exceptions to this we know to occur; and it is reasonable to suppose, in some cases at least it has been almost demonstrated, if in some obscure corner reparative action has not failed, that from some violence or accidental disturbance or other cause, the continuity of the new structure has been broken or its integrity somehow impaired, and so the poison has passed in.

And now I hasten anxiously on to prevent the possibility of misapprehension even for a moment. But no one, I trust, could imagine from what I have been saying, that I am not to the last degree impressed by the mischief which may arise from the presence in wounds of any kind of decomposing fluid; that in the most absolute and thorough cleanliness—not in the common sense only, but in a surgical one also—can a patient be at all secure. I shall return to this; but I shall not be in any way misunderstood here. My present purpose is to insist upon the fact that two conditions at least are required for the mischief of blood-poisoning; and that of late, in the concentration of attention upon the other, one of these has been strangely overlooked. There must be a fluid potent for evil, and there must be a surface ready to transmit it. Obviously, then, the means of preventing mischief, of conducting our patient safely through recovery from wounds and injuries, lies in fulfilling the opposite conditions: in the rigid prevention or exclusion, so far as it is practicable, of all putrefying or decomposing or foul fluid, and in keeping wounds in as healthy a state as possible, in fostering the soundest and most rapid process of repair. If either of these conditions be fulfilled, the patient may escape the mischief we dread; but undoubtedly the duty of the surgeon is, by all means within his power, to secure both. He is below the mark if he can ever be satisfied with less than this.

Furthermore, be it remembered that these two conditions, as the rule, are found in company. The fresh fluid upon the surface of a wound which is healthy and in process of repair is innocuous. No mischief of this kind lurks in fresh healthy pus; and if the fluid which bathes the surface of a wound become foul or putrescent, the character of the wound itself is apt to change and the integrity of the surface to suffer. Therefore, a healthy wound in process of repair and a fluid on the surface which is innocuous, as the rule, go together.

Animal fluids exposed in open vessels to the air after some time become putrid, the length of time varying with the state of the air; and so it is forthwith concluded and argued by many that if fluid upon the surface of a wound be exposed to the air, it must while there become putrid too. But the fact is, that any one who cares to witness it may see fluid at any time upon the surface of exposed wounds which is not putrid. And the explanation of this most familiar fact is simple enough: that the fluid in the vessel has been kept until it has become foul, while the fluid upon the surface of a wound in process of repair which is duly watched and properly managed is ever being renewed. The same fluid ought not to be allowed to remain long enough to undergo mischievous change. There is, after all, some difference between stagnant water and a running stream.

Dr. Roberts, in his memorable address last year, said: "Before we can understand the pathology of septicæmia, we must have clear ideas on the relation of septic bacteria to our bodies. We see in our laboratories that dead animal tissues, when exposed to ordinary air or ordinary water, invariably breed septic organisms; in other words, contact of septic germs with the dead tissue never fails to produce successful septic inoculation. But this is quite otherwise with the same tissues when alive and forming part of our bodies. You cannot successfully inoculate the healthy tissues with septic bacteria. It has been proved over and over again that these organisms, when separated from the decomposing medium in which they grow, can be injected in quantity into the blood or tissue of a healthy animal, or applied to a sore on its skin, without producing the least effect. The healthy living tissues are an unsuitable soil for them; they cannot grow in it; or, to put it in another way, ordinary septic bacteria are not parasitic on the living tissues."

"This fact," he continues, "is of fundamental importance in the discussion of the pathology of septicæmia. We have a familiar illustration of its truth in the now common practice of subcutaneous injection; every time you make a subcutaneous injection you inject septic germs into the tissues."

Thus the surgery of the present day, in this respect, is characterised as antiseptic; that is to say, since surgeons have duly recognised this great impending evil, they have, as their chief aim, striven to avert it. Here, at all events, increase of power has followed closely on the advance of knowledge. One has not, I repeat, to turn far back in our literature before all evidence of any suspicion of what is now known as blood-poisoning disappears. Our knowledge of the fact of even the existence of such an affection is of recent date; and for several years after the subject first attracted the attention of surgeons, the comparatively clear and simple view of its pathology which at present prevails was for a while obscured by theories and doctrines which drew observation away from the actual cause to speculations on phlebitis, thrombosis, and other changes which are often associated with it. The history of our present knowledge of blood-poisoning is an interesting and instructive one. At first, all attention being naturally concentrated on the changes wrought in the body, the origin and cause of the affection was sought only within those limits. Then when the truth began to dawn that the actual poison was derived from without, the pendulum of opinion, according to its wont, swung at once to the opposite extreme, and I venture to think that of late the opposite error has prevailed, of regarding only the conditions under which the poison is formed, and losing sight altogether of the conditions under which it affects the blood.

Antiseptic surgery! Unhappily there is much confusion in the current employment of this phrase. This ought to mean—and with some, but a few only, it does mean—the principle which aims to secure healthy wounds and their repair as speedily as possible (for while they last there is always risk) by the most scrupulous cleanliness—by cleanliness, I repeat not only in the common, but in the surgical sense, which means the prevention or removal or destruction of all matter which may prove poisonous. This, I take it, is the only adequate conception of antiseptic surgery; and, as thus understood the term antiseptic ought in fact to become superfluous, being thus simply equivalent to good surgery. Less than this, should mean unwholesome practice. But somehow there is a weakness among us for exuberance of this sort. What a run the phrase "conservative surgery" had, for instance, nay, still has in certain quarters, as if surgery itself were worth anything, could have any value, or even deserve its name, if

Digitized by Google

it were not in the truest sense conservative. The employment of the term conservative ought surely to mark an inadequate conception of our art, and I would fain say the same of the word antiseptic. If surgery be not antiseptic in the sense I have endeavoured to indicate, it must foster most dangerously, by covering with its sanction, the prevalence of mischief. But antiseptic surgery, as more commonly understood, implies the liberal employment in practice of special agents, which are collectively known as antiseptics; and the number of these—their name is legion—which has been introduced to the profession and the public, and the amount of many of them which is consumed, testify abundantly to the extent of opinion in their favour. But in this sense, again, I suppose all surgeons now-a-days practise antiseptic surgery. Perhaps an instance hardly ever occurs now in the treatment of a wound in which an antiseptic of some kind is not in some way employed during its progress; never, perhaps, in what should be called civilised surgery, if we allow—as we should allow—free ablution with clean water, adequately used, to be among the simplest, safest, best of antiseptics.

And lastly, the term antiseptic is employed, and this most commonly of all, to express a particular method of carrying out this great principle; the method which has attracted, and is still attracting, so large a share of attention. Of course, I allude to that which has been devised by Lister, and which is more precisely termed Lister's plan or method of dressing wounds.

It would be a matter of comparatively little moment in which of these senses the term antiseptic were used, if only the present degree of confusion could be avoided; but some mischief arises, I think, when the principle itself is confounded with any special mode of practice.

Now, since some light has been thrown on the nature and cause of this affection, what has surgery done to avert it? Yes, there are grounds for congratulation in this direction. This would surely be the answer given by the general experience of surgeons, and vague and full of fallacy as this necessarily always is, it must, and especially in this case, be allowed to go for very much. And this is the answer given by statistics, which, although too often laden with fallacy also, speak, I believe, plainly and conclusively on this point. I have no intention of trespassing on your patience now with any formidable array of figures, but shall refer to a table showing the statistics of blood-poisoning after operation or injury in St. Bartholomew's Hospital for the years 1876-77-78.

What, then, is here shown? That in 1876 the absolute number of deaths from pyæmia after operation were 2, which is at the rate of ·49 per cent.; or including erysipelas in the common term of blood-poisoning they were 5, at the rate of 1·24 per cent. In 1877, the number of deaths from pyæmia were 4, at the rate of ·95 per cent.; or including erysipelas they were 6, at the rate of 1·43 per cent. In 1878 the deaths from pyæmia were 4, at the rate of ·96 per cent.; with erysipelas 7, at the rate of 1·68 per cent. Once more, during the three years there was a total of 18 deaths from blood-poisoning after 1,235 operations, and this is at the rate of 1·44 per cent.

Now, so long as any instances whatever of this mischief occur, we shall regard our work in this respect as defective, and strive to do it better. I, at least, am ready to change my present plan of management when there is evidence of this character that better results can be accomplished by any other means.

Yes, I think it cannot be doubted that the occurrence of blood poisoning during the progress of wounds and recovery after operations has been of late very far less common than formerly, and is, I venture to believe, daily becoming yet more rare. It is far less frequent now than it was, I will not only say many years ago, when we cannot estimate its frequency from lack of any adequate record—because, indeed, then its actual occurrence often escaped even passing notice—but it is now far less frequent than it was only a few years back, within even the memory of younger surgeons. But congratulatory, I had almost said triumphant, as are the statistics of the present day, I must own that it is necessary to regard these with a jealous eye, and in some instances at least to accept them with reserve.

Now, considering all the various details in the treatment of wounds and the management of cases after operation, the practice of no two surgeons of the staff is precisely alike. Each surgeon, perhaps, carries out certain details in some way different from others, but on the chief objects in view we are undoubtedly in accord. We aim at the most scrupulous cleanliness, in the most comprehensive sense of the term. We strive to secure this by all possible means. We watch very carefully the actual state of wounds, and we use very freely antiseptics of various kinds. And, with cleanliness, we attach for the most part the highest importance to rest. We are careful to disturb wounds during the process of repair as little as possible. Cleanliness in its surgical sense, and rest in its physiological sense, may be said to be the leading aims. But we are by no means satisfied with directing attention only to wounds. We are most jealous of the state of the atmosphere. We keep the air as pure as possible. We are very careful to avoid, as far as practicable, any tendency to over-crowding of wounds in the same ward, and each patient has from 1,100 to 1,400 cubic feet of space. Lastly, we attach the highest importance to the state of health and condition of our patient before operation, and never, when we have choice and opportunity, do we inflict an injury without previous inquiry in this direction very fully carried out. Well, what of all this? will, perhaps be said. Of course, all this is done everywhere. So much the better. The results, you see, are not due to anything beyond the observance of the recognised principles of surgery. I have said our individual practice differs in detail; but my conviction is, that our results are due to the strict observance of sound principles of surgery.

As a rule, I do not employ drainage tubes. Now, the employment in routine of drainage tubes is so fashionable; they are just now, and for some time past have been, so high in favour with surgeons in general, that I must ask your indulgence to bear with me while I venture to criticise their action. The purpose for which they are so habitually employed is undoubtedly clear and sound enough: to avoid the accumulation of fluids in wounds. These fluids, when they have become changed, are the most common and active source of mischief; and the less lodgment there is of these in a wound, the safer it is for the patient. But is there no other means than this of providing for the escape of such fluids? You will perhaps gather, from what I have already said, that I for one believe there is, with ordinary care and skill. I think, if the edges of a wound be not allowed to close before the deeper parts, and that by position the outlet be made sufficiently dependant, as a rule all dangerous accumulation may be avoided. There are instances, however—exceptional, I think, after operation, but of more frequent occurrence in other cases—in which the insertion of something between the edges of a wound, or deeply into its substance, or throughout may be very useful; and then for the most part I should employ a strip of thin gutta-percha, or some threads of carbolised catgut. I am most disposed to insert something of this sort where I expect the process of repair to be least direct, where the wound is large and irregular, and where the secretion is likely to be profuse and rapid. For example, after the removal of a breast in a very fat person, I should probably, at one or two parts, insert a narrow slip of gutta-percha. But why not, then, do this in every case? Well, I think there is no material objection to it; and, where otherwise the progress of the wound cannot be watched in a trustworthy manner, it is better to adopt it. But I repeat that, as a rule, in the management of the simpler wounds, under the care of a surgeon who knows his business, there is no need of it. But in my mind, there are positive objections of great weight to the employment of drainage tubes. At first sight, indeed, for their chief

Digitized by Google

purpose, they are very plausible instruments; but do they after all effectually discharge their duty? Does the greater portion of the fluid which forms in a wound where they are, as a rule escape from them? From my own experience, I should say, No; and I do not think I am at all singular in this observation. It has been more than once publicly pointed out—and I am sure the fact must have been often witnessed—that when a drainage-tube is withdrawn from a wound, a gush of fluid will follow it; and almost always some fluid, more or less, trickles after it, more than enough to provoke mischief if it be poisonous, and can pass into the blood. In any case, the fluid which forms in a wound will flow downward to the deepest parts, and not upward unless under pressure; and if from the position of a wound the aperture or apertures be at the dependent part, it will escape without tubes. If it be not, if there be a cavity within deeper than the outlet, what power, I should like to know, have drainage-tubes to draw it upward out of this? I think, then, if the position be satisfactory, and the vent sufficiently free, they are needless; if the position be not satisfactory, they are useless. I say, therefore, as a rule, drainage-tubes are not effectual instruments for their chief purpose. But, furthermore, their presence is often directly and actively mischievous. They are foreign bodies in a wound. They act, of course, as foreign bodies in almost all circumstances do; they irritate, they provoke suppuration and the formation of fluids. Those who are accustomed to witness with complacency the escape of fluids along drainage-tubes hardly reflect that the drainage-tube has been a cause—perhaps the prime cause—of the formation of the fluid which flows out. When I see these tubes moved to and fro in a wound with the escape of pus, I am forcibly reminded of what I have often seen in former years, the action of setons. A drainage-tube is, in fact, a seton. Even when they are retained only for a short time, not long enough to induce further mischief, they are fatal to the chance of direct union of a wound. And is this, the best of all results, to be now altogether given up as a visionary idea? Is union by the first intention to become a thing of the past? When I see, for example, a fatty tumour, small or of moderate size, removed from under the skin, and then the edges of the wound stitched closely together over a drainage-tube lodged throughout its length, it seems to me simply idle to talk of principles of surgery. That such wounds do at length close in spite of this treatment I know; but I think I know also that they will heal more quickly and kindly, directly without disturbance, if they are simply closed in the way to which I have already alluded to. It is surely very rare indeed for such wounds, if thus naturally treated and duly watched, to give rise to any anxiety or trouble. For my part, I do not think the risk, such as it is, at all lessened by insisting on a more circuitous process of repair.

I do not contend that drainage tubes ought never to be employed. In exceptional cases, I believe the advantage outweighs the evil of their use, as, for example in the after-treatment of empyema, where they are very useful in enabling us in a far more satisfactory manner to wash out the chest; and this, by the way, is an advantage often claimed for them, and with some force, in other instances. But I do not believe there can be usually much difficulty in washing out the interior of a wound, without the necessity for that purpose of the permanent insertion of a drainage-tube.

But now I must pass on to speak of that particular plan of practice which aims at unconditional security—the plan the purpose of which is to exclude all risk of blood-infection by the rigid exclusion of living germs; notably of that particular method which has been introduced by Lister, and at present known everywhere as Lister's method. Now, the relative value of this mode of treating wounds may be tried—should be tried, I think—first by the facts which have been ascertained in regard to it; and, secondly, by the arguments which can be advanced for or against it.

First, then, with regard to actual facts: are there any trustworthy statistics to show that hitherto the results obtained by Lister's plan are better than the best results obtained by any other method? I think most will admit that this is a question of considerable weight. Well, I take, for instance, our hospital statistics, to which I have already referred, on the one hand, and—I seek in vain for any parallel results on the other. And, while this is so, I shall consider that I am justified in the conviction that hitherto the best results have been achieved by the simpler method. I must add too that one seeks in vain for statistics of any kind from sources from which I submit we are entitled to expect them. Why are such statistics withheld? Are they not worth the trouble of collection? And, if they have been collected, why are they are not published? But let this pass. I say I know of no results from Lister's method like those which I have given. Indeed, many of the statistics which have been so triumphantly presented to us make but a sorry figure by the side of the best, and they admit only of excuse by comparison with former results from the same place. And here I cannot help thinking that confusion and fallacy prevail on this matter; that, to answer this prime question, old and new results are constantly compared. Some hospitals, in which for several years the results have been much more unfavourable than those which can now be shown, have adopted this method, and the contrast has been striking; that is, the old and new statistics of the same institution have differed widely; and this shows that a great improvement has been wrought there by the adoption of Lister's method; but it by no means shows, as many seem to accept that it does, that the best results of all can be obtained by this plan. For the fact is, conclusions drawn from comparisons of former and present practice at the same hospital are, in all probability, charged with this fallacy: that almost everywhere, from the attention which has now been for some past directed to the subject, and from the greater care and caution exercised, the mortality after injury and operation has been considerably reduced. I might give you illustrations of what I mean in figures which have been published in triumphant demonstration of the superiority of this method. What do they actually show? Why, that, while the adoption of Lister's plan has effected a vast improvement in the death-rate of a particular institution, the results obtained by it are still far below those which have been obtained by other methods. The contrast between the results of Lister's plan and the records of what I would fain hope may now be called former days is most marked where the previous mortality was highest; and it is easy to understand why the most enthusiastic reports in its favour come from those places where the sanitary conditions are worst. Beyond all question, I should say, in too many instances, it has proved far better than that which it has replaced; but to conclude from this that it is better, or in its results equal to every other plan at the present time adopted, is to set the simplest rules of logic at defiance, to foster error and confusion. No; Lister's plan must be tested (it would be an insult to its author to propose less), not by contrast of former with present statistics, but by comparison of its results with the best results which now are obtained otherwise.

But on this question of actual fact I must remark farther that, from observation of the method in cases in my own hands or under the care of my colleagues, I am impressed with the conviction that, as a rule, wounds heal more satisfactorily, more directly and quickly, under simpler plans. But an error of a like kind prevails here. An operation is performed in a sufficiently simple and straightforward case; this mode of dressing is adopted; all goes well; the wound heals; and the result is forthwith registered as demonstrative. The majority of wounds heal very well under various plans; heal, for the most part, in spite of many hindrances, if these do not exceed certain limits; and the majority of wounds heal under this particular plan.

Digitized by Google

But I need hardly observe that the great question at issue is not at all touched by this kind of evidence.

I ought, however, to allude to a fact of which I, and probably many others, possess some evidence, that Lister's method has been both charged and credited with results that do not belong to it. A satirist might, indeed, have found ample scope for indulgence during the last two or three years in the treatment to which wounds have been subjected under the auspices of this plan. Very often, I should say, they have been converted into germ-traps and hotbeds for the cultivation of bacteria. But I repeat my conviction, that when the plan is accurately carried out, as a rule, it delays the repair of wounds.

But, further, it is said that, under this plan, we are enabled to perform certain operations with success, to achieve results in surgery which cannot be attempted with any reasonable prospect of success by other methods. I take leave to doubt whether these assertions are borne out by facts. In my humble opinion operations are sometimes performed both with this method and otherwise, which in any case had better be left undone; but I believe that patients have escaped with life after operations as full of risk to it, with other methods as with this. But this sort of statement, because it admits of no direct refutation, is never wanting in favour of any novelty. Has any new plan of treatment ever been proposed unsupported by abundant illustrations of its excellence? Are those who can tell of wonderful results from this method in a position to state that none equal to them have been accomplished in other and more simple ways? If it were not for the interests at stake one might find some amusement in hearing and reading, in the light of experience, of the surprising triumphs of "antiseptic surgery." But this is an old story; a tale too often told. With reference to this, Bryant has well said, "The publication of isolated cases, however good, proves nothing, whereas the withholding of the whole suggests much."

So far as actual facts, therefore, are at present concerned, and it seems to me that the time has arrived when we may use such records, if I am to adopt that line of practice in which the mortality is lowest, I cannot see that I have as yet adequate grounds for relinquishing the plan of treatment I at present follow.

To the next point. This particular plan of dressing wounds is founded on the accepted fact that the germs in the air are the sole cause of blood-infection, and its purpose is the prevention of this by their rigid exclusion or destruction. Is then, let it be asked first of all, this purpose by this means fulfilled? Does blood-poisoning ever occur in this practice? In point of fact, it does from time to time occur, and sometimes proves fatal. Everyone is aware, of course, of the answer which is given to this, that it is due to the mode of dressing being imperfectly carried out; to some flaw in the management of the details. To this again it may be replied that, although the contrary does not, from the nature of the case, admit of proof of actual demonstration, such a catastrophe has undoubtedly occurred; does still not unfrequently occur in skilful and experienced hands, in the practice of excellent surgeons, enthusiasts in this method. And if this be so, it practically, you see, amounts almost to the same thing. If the plan be only ideally perfect, and liable, in spite of such care and dexterity, to fail in practice, it still misses its aim. Indeed, here is the critical question: If it be not absolutely, unconditionally protective, in what relation does it stand to other methods? Why, so far as we have facts to guide us, as I have already stated up to this time, it has not made out its case. And, then, are there no positive objections to it? It shuts out the wound from view—to my mind, no trivial drawback. The wound cannot be examined without an elaborate process of change of dressing always involving disturbance, if not risk; and although it may be said that confidence in the safety of this plan dispenses with such need, the question again arises whether it is reasonable to give such confidence as this. But it is further urged that one can tell by other signs what is going on in the part; that local mischief is revealed by rise of temperature or of pulse. Yes, after a while, but not until the system has been disturbed by it. I think that when a wound or injury is under ready inspection we may detect the tendency to go wrong earlier than this; and upon the earliest detection of such tendency I think very much may turn. I do not believe this objection can be explained away. Then this mode of dressing very often irritates; as the rule, more or less, sooner or later. This local irritation, as the result of their repeated action, is, I should say, one of the most annoying objections to the use of antiseptics in general. They will do this; and although for a great end, this may, within limits, be endured as a comparatively trivial circumstance, yet it not unfrequently proves to be of more serious moment by interfering with and so delaying the process of repair. Thus certainly their employment in this way is not favourable to the best results of surgery in the repair of wounds by the simplest and most direct process. But while I think it must be conceded that this mode of treatment is not favourable to union by the first intention, it is claimed for it that, when wounds close by a more circuitous route, this process is shortened and simplified. I say to this—not proven; on the contrary, that the evidence is the other way. It has been affirmed that, under this plan, the constitutional disturbance, as indicated by the rise of temperature which usually attends the repair of considerable wounds, is very much reduced in degree. I have often heard the assertion made that there is usually little or none. I have reason to believe that many very exaggerated notions prevail in regard to the amount of constitutional disturbance attending the repair of wounds when managed otherwise. As a rule, there is more or less constitutional disturbance shown by rise of temperature during the repair of large wounds under any plan; but the evidence at present before us by no means shows that with this method it is less than under any other.

Again, much has been made in this matter of the formation of pus. It was, I believe, once contended that the formation of pus is prevented by this means; and now, that the process of suppuration is very materially reduced; that it is serum or a serous fluid, rather than pus, which wounds so treated pour out. Well; but when wounds have to heal by granulation, is laudable pus a cause or sign of mischief? I am not speaking of profuse and long-continued suppuration, which is really out of the question here; but of such suppuration as usually occurs during the repair of a wound. For my part, I confess I am neither ashamed nor afraid to see well-formed pus covering the surface of granulations; nay, I accept it as a very favourable sign. I am accustomed to watch it carefully; for I think, in the change of character of this secretion, we have often the first signal for good or for evil, and, as a rule, the condition is satisfactory under a layer of laudable pus. I say, then, even accepting the statement, it remains to be shown that a serous speaks of a better state of things than a purulent discharge.

Then, for me at least, and for the reasons I have given, the constant and prolonged employment of drainage-tubes is a serious objection. I am convinced, I repeat, that they too often prove sources of local and general irritation. Thus I have seen a large chronic abscess opened and dressed carefully with the rigid precautions of Lister's method. I have seen the patient day after day but little disturbed, with a temperature one or perhaps two degrees above the normal; and then, at the end of a week, or of nine or ten days, I have seen all the dressing hitherto applied suddenly removed, the drainage-tube withdrawn, and a common bread-poultice applied to the now fully exposed surface. The result has been that the temperature has quickly fallen to the normal point; and my belief is that, in more than one instance, the reduction of temperature was mainly due to the removal of the tube, which, as a foreign body in the wound, was a source of irritation.

I say, then, I cannot admit the claims of Lister's method; because, although undoubtedly very good results

Digitized by Google

are to be obtained by this practice—better ones, no doubt, than most of those which were reached in former years, or are still in many places—yet that it has not shown results superior or equal to those which have been otherwise achieved; that it has, moreover, grave drawbacks from which simpler plans are free; and if it fail, it is worse than useless by increasing the risk; and, therefore, that it has not established any title to supersede all other methods in the practice of surgery.

The principle of Lister's practice is an easily intelligible, and, therefore, a very attractive one to the public—I mean the more educated portion of it, even to men of scientific attainments, who have little or no knowledge of clinical surgery; for the one fact can be seen so plainly, while all other questions which are forced on the attention of the surgeon are shut out from them.

But the principle on which it rests is a sound one; the logical outcome of established facts. Granted most freely and fully, so far as in this direction it goes. But is every other plan of treatment without principle and opposed by logic? Let me recall your attention to some words which appear to me to be among the wisest which have been spoken on the subject. In 1877, in his Address on Medicine, Dr. Roberts said: "We should probably differ less about the antiseptic treatment if we took a broader view of its principles. We are apt to confound the principle of the treatment with Lister's method of carrying it out. The essence of the principle, it appears to me, is not exactly to protect the wound from the septic organisms, but *to defend the patient against the septic poison.* Defined in this way, I believe that every successful method of treating wounds will be found to conform to the antiseptic principle. Take, for example, the open method of treating wounds, which is sometimes compared in its results with Lister's method. What is this treatment but another way (only less ideally perfect than Lister's) of defending the patient against the septic poison? Because, if the surgeon succeed in providing such free exit for the discharges that there is no lodgment of them in the wound, either they pass out of it before there is time for the production of the septic poison, or, if any be produced, it escapes so quickly that there is not enough absorbed to provoke an appreciable toxic effect." Which plan, after all, takes most cognisance of all the facts before us? While it is true that the air contains germs which can so change animal fluids that if then they pass into the blood they may poison it; it is also true not only that fluids which have never been in direct contact with the atmosphere may be pent up, far from the surface, in various parts of the body without infecting the blood, but also that open wounds may be, and are continually, freely exposed to the air, and yet remain all the while healthy, being the process of repair carried on without let or hindrance, or any disturbance of the health; that fluids which bathe the surface of wounds may be saturated with the air and all it contains, and still escape before they have undergone any mischievous change; that, lastly, and not least, fluids may thus become changed to putridity on the surface, as in the interior, and yet may not give rise to infection of the blood. In the discussion of this great question, it is too often implied, though not explicitly expressed, that if the unpurified atmosphere be allowed to come into contact with wounds it produces mischief. And if it be said that, assuming the risk to be ever so small, why not adopt means which avoid it altogether? the answer is, that it has not yet been shown that any such means exist. Blood-poisoning from wounds, though happily now in the best places extremely rare, still, under whatever mode of practice be followed, does occasionally occur; and so it seems to me most reasonable to follow that practice which is shown to be, on the whole, safest by its results, it being, moreover, the simplest and least objectionable in other ways. In short, it is clear enough that Lister's plan, while it deals with one cause only of danger, provides by no means absolute security against this. When seriously tested by a bad atmosphere, it has hitherto obviously left a wide margin of mischief. Compare, for example, German and other statistics with our own. And when hygienic conditions are as favourable as possible, the risk from the single source of which this method takes heed is so far reduced that the good it can effect, beyond other measures in this direction, is not equivalent to the harm it does in other ways; as, for example, by irritating the wound, and so interfering with the process of repair.

Observe, if you please, that I am not saying that Lister's practice is to be in every case, and under all conditions, eschewed. I can very well imagine—nay, I know of circumstances where I have no doubt it would be far safer to employ it than to run the great risk of exposure. It is preferable to a pestilential atmosphere. But I submit that, while in such places and with such arrangements, if operations must be performed or wounds treated, this, or something like it, should be adopted, it would be far better, wiser, more humane, to stop the practice of surgery altogether until these places had been made clean and reasonably pure. I refer again to the records from Germany. When we observe the rate of mortality before and after the adoption of Lister's method, we are tempted to ask, what would have been the result if all possible care and forethought had been directed to the improvement of the sanitary state of the hospitals? Why should they have been, why are they still, so far behind others in this respect? You will remember the story of the Norfolk and Norwich Hospital as Mr. Cadge told it; and you are not likely to forget the ghastly sketch Lister drew after his visit to some of the Continental hospitals only four years since. It is the evil of this, or of any special or peculiar plan of dressing, that it tends to limit our view, and by fixing the attention on a number of details, each of which is made of prime importance, diverts the mind from the observance and consideration of far larger questions. Yet notwithstanding the veil which has for a time been drawn before the eyes, there are already signs that the field of vision is extending. It is now many months ago that I read of a distinguished German professor using, as he tells us, extraordinary precautions: "that, on an operation morning, he gets up early and washes himself all over; that his assistants wash themselves; and that the patient is also washed;" and although a famous Scotch surgeon, who relates the story, adds, "Surely all these washings are unnecessary," let us hope that, in interests besides those of surgery, the expectation at least, of an operation, may become of daily occurrence. We cannot, indeed, render the air absolutely or "optically" pure for the practice of surgery; but I think, under fairly favourable conditions, and with the means at our command, operations may be performed and wounds treated in an atmosphere not so impure, but that, on the whole, the least risk is run by the practice I have ventured to advocate.

One word farther. I have spoken without reserve—as I take it I was bound to do if I spoke at all—of this now famous plan of treatment. By this I think I have shown the truest respect for the author of it. If I esteemed the practice of Professor Lister less, it would have been easy to offer him the homage of flattery, to congratulate him on his renown. It appears to me that I have evinced more regard for his authority, and placed a higher estimate on his work, by studying to the best of my ability the method he has introduced; by not expressing an opinion adverse to it in public, or from a position of responsibility such as this, until my conviction had grown clear and strong; and then I think I best mark my appreciation of his purpose by thus speaking out freely and fully. And though I am thus—not on principle, but in practice—opposed to him and many others whose ability and knowledge I admire and respect, I know very well that on a yet greater issue—the advance of surgery—we are heartily together; and with unfeigned diffidence of my own judgment, I have yet farther consolation in the assurance that, if I am in error, these words of mine, even from this place, will prove no serious obstacle to the progress of truth.

Whatever defects may be charged against surgeons in the practice of their art indisposition to accept new ideas, or lack of zeal in testing new proposals, cannot be reckoned among the number. And if in some the desire may appear to be

Digitized by Google

excessive, it must be remembered that this is the natural outcome of discontent at the inadequacy of the resources they can at present command, and that such dissatisfaction is the parent of progress and improvement. A curious list, indeed, might be drawn up of the numerous novelties which from time to time have been introduced into surgery, and which, after attracting much attention, have been tried and found wanting. And if it so happen that this particular mode of dressing wounds should share their fate, still, like many others, it will have served some useful purpose; for it will at all events have helped largely to fix the attention of surgeons on a great source of danger from wounds. Nor is it perhaps likely to be superseded altogether by any plan of management which does not include among its chief objects the reduction of this risk to the utmost extent possible. Henceforth, no doubt, as the result of all the attention and discussion which have been given to this matter, the words cleanliness and purity will have a wider, deeper, fuller significance for the surgeon. Hospitals and all institutions where the practice of surgery is carried on will soon, let us trust, be no longer open to the shame of even a suspicion of their state. They must not only be made free from all doubt that in their wards mischief may be fostered; but they must offer year by year in their records the surest guarantee that they are the safest places for patients. At present, in the worst, antiseptics are the only means employed for counteracting this gigantic evil; and its proportions may, perhaps, in some degree, be measured by the lavish manner in which antiseptics are consumed. But, after all, they fulfil their purpose but imperfectly, and are themselves not free from evil. Is it rash to affirm that the future practice of surgery will be most successful when it is carried on, not where antiseptics are most largely used, but under conditions least in need of antiseptics? Nay, is not this so now

The study of blood-poisoning, the attention which of late has been directed from all sides on this great subject must prove of advantage to surgery in another way. For some time past, and to the prejudice of our profession, a wall of partition between medicine and natural science has been gradually built up. Physicians and surgeons finding enough, and more than enough, to do in their own immediate work, have of late years passed by the study of natural science, even that branch of it which most immediately concerns them—physiology or biology—with hardly a glance. And the loss from this, which was formerly allowed to be considerable, comes now to be actually questioned in some quarters as a fact. Nay, those who have never made any effort to find opportunity for this pursuit are wont to assert boldly the uselessness of it, and speak of it plainly as a waste of time. The study of blood-poisoning in its present form has effected for us in our profession this great good. It has led us back into paths which have been too long untrodden, and forced upon many of us, in a most attractive way, some little knowledge at least of the first principles and leading facts of biology. It has, at all events, in great measure imposed silence on those who have been accustomed to talk loudly of what they call practical work, and to meet every inquiry not likely to pay with the vulgar version of *cui bono?* And while, on the one hand, we have been thus forcibly reminded that surgery can never, without degradation, be divorced from physiology; on the other, this fertile field has proved to be common ground on which natural philosophers and surgeons may with mutual advantage, and in furtherance of the same immediate result, work together. It is true enough that no progress of any kind can be made in natural science without advantages in which medicine and surgery must always largely share; but still it is something just now to have a subject like the present one, in which the truth is made so plain upon the tables that he may run that readeth.

And it may be remarked that surgery, while it works in this direction, fulfils its highest purpose, for it aims at the prevention of disease. Heretofore our art has not escaped the reproach that, whatever it may have effected in the way of relief or cure, it has done little or nothing in the work of prevention. But what shall be said of the progress which has been made in averting the occurrence of blood-poisoning; in preventing the most fatal of all affections, which waits alike upon accidental wounds and the surgeon's own work? In accomplishing so much, it has not only thrown light over one of the darkest regions of pathology, but also, by reflection, on the laws which govern health and life.

THE TREATMENT OF UTERINE TUMOURS BY DILATATION AND THE ÉCRASEUR. (a)

By GEORGE H. KIDD, M.D.,

Master of the Coombe Lying-in Hospital, Dublin; President of the Obstetric Section.

It is usual for the President of the Section to open the proceedings either with a *resumé* of the work that has been recently done, or other subject of general interest, or with a report on some subject at which he has himself been working. On the present occasion I propose to adopt this latter course, and to invite your attention to the consideration of the surgical treatment of some forms of uterine tumours; but, in doing so, I shall not touch on either the history or literature of the subject, which unfortunately the time at our disposal will not permit, but shall confine myself to some points arising out of my own experience.

It will, perhaps, be in the recollection of some now present that, so long ago as 1868, at the meeting of the Association at Oxford, I described a peculiar method of dilating the uterus, and related a case in which I had been enabled by this means to remove a large number of intra-uterine polypi. In a paper subsequently published in the *Dublin Quarterly Journal of Medical Science* for February, 1869, I gave a diagram illustrating this method of dilatation, and showing the polypi as found in the uterus at the time of the operation. Some copies of this diagram are now on the table. It will be observed that six pieces of sea-tangle, long enough to reach from beyond the os externum to the fundus, but not to touch it, have been introduced side by side, one after another, forming a bundle of parallel pieces; and it will be seen that these, as they absorb moisture and swell, must dilate not only the os externum, but the os internum and the cavity of the uterus itself at the one operation. Thus, if the os be sufficiently large to admit the necessary number of pieces at the first sitting, the whole process may be completed in twenty-four hours. If not sufficiently large, a few pieces must be introduced in the first instance, and removed at the end of twenty-four hours, when a larger number can be used, and dilatation thus effected to any required extent. Generally, even in the nulliparous uterus, the tissues are so relaxed by hæmorrhage that five or six pieces, each as large as a No. 6 catheter, can be introduced at the first sitting, and a dilatation procured sufficient for the introduction of the finger and exploration of the uterus, or the removal of small tumours. For the removal of larger tumours, however, a much greater degree of dilatation is required, and it may be necessary to introduce from twelve to eighteen pieces, which can generally be got in at the second sitting if six have been introduced at the first; but it is to be borne in mind that it is always advisable, when about to remove the tents, either for the introduction of others or for proceeding with the operation, to wash out the vagina with a solution of permanganate of potash, and after their removal to wash out the uterus itself with a similar solution before any further steps be taken; for, though sea-tangle does not give rise to the putrid and offensive discharges found when sponge is used, yet fluids accumulate which are irritating, and may, if not removed, prove injurious both to the operator and to the patient.

We have recently had a new kind of dilating material made known to us under the name of tupelo-tents that may, at the second sitting, be advantageously used instead of sea-tangle. This substance has been brought into notice by Dr. Sussdorff, of New York, in a paper published in the *New York Medical Record* of July, 1877. The tents are formed from the root of the *Nyssa aquatica*, which grows in the swamps of the Southern States of America. As imported into this country, they are too short to be of much use for dilating the uterus; but Messrs. Fannin and Co., of Dublin, have procured them for me of the full length required. These tents swell more quickly, and in proportion to their size when dry to a greater degree, than does the sea-tangle; but the tangle can be more easily introduced in the first instance, and, from its slower and more gradual action, will probably be found less painful and safer for the patient than the other. As soon, however, as the process of dilatation has commenced, and the tissues have become

(a) The Opening Address in the Section of Obstetric Medicine, at the Annual Meeting of the British Medical Association in Cork, August, 1879.

Digitized by Google

softened and relaxed, the tupelo will complete it more quickly and thoroughly than the sea-tangle. If three tupelo-tents can be introduced at the second sitting, and along with them four or five pieces of No. 6 sea-tangle, the uterus will generally be found sufficiently dilated at the end of a further twenty-four hours to permit the removal of a tumour measuring from three to four inches in diameter.

The dilatation of narrow passages dates from the earliest ages of surgery, prepared sponge being the substance generally used for the purpose; but, till suggested by Sir James Simpson about thirty years ago, the exploration of the uterus by its means had not been attempted. Till then, as Sir James has stated, intra-uterine polypi "were generally considered as placed beyond the pale of any certain means of detection, or any possible means of operative removal." But now, following in his footsteps, and using the improved methods at our disposal, large tumours, such as even Sir James Simpson would not have thought of touching, have been made accessible, and brought within the domain of surgery. The dangers and inconveniences, however, attendant on the use of the sponge, have deterred many from attempting to dilate the uterus at all, or have led them to do it timidly and inefficiently; thus Dr. Emmett, in his recently published book, a work which would amply prove him, if we did not already know it, to be not only a bold but a most skilful and successful surgeon, though he describes a modification of the sponge-tent, and a special instrument for dilating the uterus, seems to scarcely use either for purposes of treatment, but for diagnosis only; and, indeed, specially recommends, in speaking of large tumours, that no attempt should be made for their removal till they appear at the os and begin to come down into the vagina. But we all know that, in the majority of cases, a woman's health is shattered and her life often placed in extreme jeopardy long before the tumour makes its appearance at the os, or begins to press on it. As a further example, I may mention that one of the specimens on the table was removed from the uterus of a lady who for some time was under the care of one of the most eminent gynæcologists and successful operators of the age, who, after spending a week in trying to dilate with sponge-tents, gave up the attempt, and recommended that the uterus should be extirpated, or the ovaries removed by Battey's operation; yet, after the use of two series of sea-tangles for forty-eight hours, the tumour, which was imbedded in the posterior wall of the uterus near the fundus, was safely removed by a combined process of enucleation and avulsion: an operation hazardous enough, but certainly much less so than the extirpation of either uterus or ovaries. In another case, which occurred about two years ago, the patient had been assured by one of the leading gynæcologists in the north of England that the tumour, the nature of which he had fully recognised, could not be removed by any possible means, yet, by the means now detailed, it was, in a space of forty-eight hours, brought within reach and removed; and the lady, who had lived several years in sterile marriage, has since given birth to a child. I have not the tumour here to exhibit, for she insisted on taking it home with her to show to her friends that such tumours could be removed.

Having dilated the uterus and made the tumour accessible, the next step is to remove it. In the paper on uterine polypi already alluded to, the mode of removing a polypus with an écraseur is described, and illustrated by a diagram; even large tumours, if prominent into the uterine cavity, may be removed in the same way. The uterus is first drawn down to the vulva, having been seized by a strong vulsellum; then the tumour is laid hold of either with a fine vulsellum or tenaculum, or with the "spiral instrument" described and figured in his book by Dr. McClintock, which is, indeed, nothing more nor less than a long corkscrew, and the loop of a wire écraseur is passed round its base. In my first paper, I recommended that this should be a soft iron wire; but I now find that, for large tumours, a finely tempered steel wire is the best, such as a piano-string, as it, though it may be compressed in passing through the os, opens again by its own elasticity when it gets into the cavity of the uterus, and is, therefore, more easily passed over the tumour, and it is, besides, firmer and stronger than the iron, and will bear a greater strain. In using an écraseur, one of two effects will be produced. If both ends of the wire be attached to the screw, then a purely crushing movement is produced. When the screw is worked, the wire constricts the tissues till it gradually crushes its way through. If one end of the wire be attached to the screw, and the other fixed, then a cutting motion is obtained combined with the crushing. This combination of cutting and crushing enables us to divide tumours that would resist and break the strongest crushing instruments; but to obtain the combined action of cutting and crushing, the screw holding the wire must travel double the distance required in the crushing movement. With the ordinary écraseur, consequently, it is often necessary to stop in the middle of the operation, and readjust the wire before the operation can be completed. This might, perhaps, be obviated by using Weiss's écraseur, which has a windlass to wind up the wire, but the instrument is very cumbrous, heavy, and inconvenient, and I believe it has never come into use. A Dublin student, Dr. Denham, son of Mr. Denham, ex-Master of the Rotunda Hospital, has, however, invented a simple instrument by which either a crushing or a combined crushing and cutting action can be obtained; and by its use, what has hitherto been one of the greatest practical difficulties in cutting through the base of large sessile tumours will probably be quite overcome. The difficulty consisted in this, that to encircle a tumour of, let us say, from three to four inches in diameter, the loop of wire must be more than from nine to twelve inches in length, and if only one end of it be attached to the screw so as to give the combined cutting and crushing movement, the écraseur must be so long as to be unwieldy in its proportions and weakened in its powers. Denham obviates the difficulty by making one end of the wire traverse the whole length of the screw, and enabling us, this being accomplished, to make the other end, by a very simple movement, take up the action and follow the same course. An inspection of the instrument which lies on the table will show at a glance how this is accomplished.

What has been said so far, as to the removal of the tumours after access to them had been obtained by dilating the uterus, refers to intra-uterine tumours—that is, those which have grown into the cavity of the uterus; but interstitial tumours, or those imbedded in the substance of the uterine wall, when they approach closely to the mucous membrane, often give rise to hæmorrhage, as serious and as injurious to life and health as that caused by intra-uterine tumours. The avulsion or enucleation of such tumours has long been practised; but, till Dr. Marion Sims and Dr. Gaillard Thomas described their mode of operating and devised instruments for the purpose, it seemed to me too dangerous to be attempted, except in extreme cases. Such tumours can now, however, be removed almost as safely as those which have grown into the uterine cavity; but when they lie high up in the cavity of the uterus, full dilatation must first be effected, and for this purpose the method now described appears to me to be the safest and most efficient.

A series of observations on the shape of the uterus, when enlarged by the growth of a tumour in its cavity or in its walls, has induced me to suggest a few simple rules for the diagnosis of the relations and position of the tumour, which seem likely to enable us to know, before proceeding to dilate, the conditions that will probably be met with. The rules may be summed up as follows. When we have evidence of the existence of a tumour, and the cavity of the uterus is enlarged, if the uterus be uniform in shape, without any bulging out or unequal enlargement of any of its walls, the tumour will probably be found to be more or less pedunculated, growing from the fundus of the uterus and hanging down into its cavity. If the uterus be found unequal in its outline, bulged out at one side and straight at the other, and if, on introducing the sound, it pass along the convex or bulged out side, then the tumour will be found to be growing from the wall opposite to where the bulging out occurs, and projecting into the cavity. If this bulging out be sudden and much marked, the tumour will probably be pedunculated; if the bulge be less marked and gradual, the tumour will probably be sessile, and projecting into the cavity from the wall opposite to the bulge, and may be so far interstitial as to have a thin layer of muscular fibre covering it over under the mucous membrane. If the uterus be bulged out in the same manner at one side, and the sound pass along the straight instead of the convex or bulged side, then the tumour will be found to be interstitial, and deeply seated in the uterine wall, closer probably to the peritoneal than the mucous surface. If further experiments should confirm these rules, they will, I hope, afford us some aid towards deciding in what cases an operation should be urged, and in what it should be undertaken with more caution.

There are many other points in reference to uterine tumours on which I should be glad to offer some remarks; but time warns me that I should not trespass further on your patience. I have placed on the table a few specimens of tumours removed in the manner described.

CONTRIBUTION TO THE STUDY OF THE OSSEOUS TUMOURS ON THE EXTERNAL AUDITORY MEATUS.

By Dr. DELSTANCHE, fils, Brussels.

Translated, by permission of the Author, from the "Mémoires Courronnés et Autres Mémoires," de l'Académie Royale de Médicine de Belgique,

By JAS. PATTERSON CASSELLS, M.D., M.R.C.S., Lond.,

Fellow of the Faculty of Physicians and Surgeons; Surgeon to the Glasgow Dispensary for the Diseases of the Ear; Aural Surgeon to the Glagow Royal Infirmary; and Lecturer on Aural Surgery in the Royal Infirmary School of Medicine, Glasgow; Membre-Correspondant de la Société Royale des Sciences Médicales et Naturelles de Bruxelles.

(*Concluded from page* 133.)

By the use of electricity Clark, of Bristol, has achieved one of the finest and most perfect cures that has been obtained up till this day.

It was that of a young girl, æt. 15, whose right auditory meatus was obstructed by an exostosis, so large, that the probe could scarcely be introduced between the osseous excrescence and the anterior wall of the meatus. The patient had had previously a mucous polypus on the same side, which had disappeared under the influence of tannic acid.

After a trial of the continued current, which it was necessary to give up on account of the intense pain that it caused, and the growth of the tumour having in the meantime so increased as to complete the obstruction of the canal, Clark had recourse to electrolysis, which he applied at two different times. The patient having been put under the influence of chloroform, three needles were stuck into the thickness of the tumour, two at the base, the other at the top. The first were put in communication with the negative pole, the last with the positive pole. Each sitting did not exceed three minutes. Three weeks from that time, it was ascertained, after having anæsthetised the patient, that the tumour had become moveable, and that pressure exercised upon it would cause it to come off. On its removal in this way, the membrana tympani was seen to be normal and the hearing entirely re-established.

Before finishing we must say a few words about a communication by Dr. Cassells on this subject, and which appeared in the *British Medical Journal*, 15th December, 1877.

We are very much mistaken if the ideas expressed in that note by the honourable specialist of Glasgow, upon the Etiology of Exostosis of the Ear, will have the effect of rallying partisans among the practitioners who have studied this question. The note is as follows:—

"The following conclusions in regard to the origin of aural exostosis are the result of several years of observation of such cases. These conclusions are now very briefly laid before the profession in order that further and mayhap wider observation on the part of others, may prove or disprove their correctness. In the meantime, so far as my knowledge of the subject goes, I may claim to be the first observer who has given a rational explanation of the origin of an aural exostosis supported by clinical and pathological facts,—these conclusions are as follows:—

"Premising that aural exostosis and hyperostosis are totally distinct affections in regard to origin, form, site, and treatment, an aural exostosis is benign in origin, only to be found on the outer half of the external auditory meatus, has its point of attachment *always* at the posterior wall (more of this point by-and-bye), is pedunculated, and has its origin in the periosteum of the mastoid, close to the meatus.

"The origin and development of an aural-exostosis are as follows:—

"At the outset a sub-periosteal abscess forms over the mastoid, and makes its way out and into the meatus, in the line of least resistance, coming out between the cartilaginous and osseous portions of the canal,—sometimes even through the cartilage of the canal, discharging itself, and continuing to do so for some time. By-and-bye, highly vascular granular-like growths sprout from the opening of the abscess, and go on increasing in size, while at the same time they are being gradually changed into bony tissue in their interior, by the gradual conversion of their cells into bone cells.

"The final size of the osseous tumour or exostosis, as well as its form, is determined by the original size and form of the granular-like growths. After complete ossification, no further increase takes place in the size of the tumour."

In order to avoid forming a rash judgment on the value of Dr. Cassells' theory, it is necessary to wait till he makes us acquainted with the manner in which it has been brought about, as the conclusion of the preceding lines will be published in the "Archiv f. Ohrenheilkunde." We are very curious to see a clear distinction between exostosis and hyperostosis established by him, because up till the present time no writer that we have consulted has entirely satisfied our curiosity on that point.

Virchow says, "By 'exostosis' is meant a production with a more circumscribed base; by 'periostosis,' a swelling on a larger surface, and by 'hyperostosis,' that same phenomenon upon an entire bone, or at least on an entire portion of a bone."

This is even very vague, for Virchow remarks that these differences are only distinguishable when it is a large bone that is affected; in the case of small bones, on the contrary, all that is confounded, because periostosis and hyperostosis can be absolutely presented as exostosis on a large bone. "These are expressions which have acquired a conventional meaning, and which do not always represent a marked difference between the things that they are employed to designate." (Virchow.)

Have these growths so definite a character, whether histological or etiological, as to permit an absolute line of demarcation being drawn between them? Since no one has found that character, we think ourselves perfectly authorised to include under the universal denomination of "Exostosis" of the auditory meatus, as far as we have seen till now, every tumour, or osseous production of that canal, pedunculated or sessile, whatever be the origin or mode of formation, provided it be exclusively constituted of the elements of true osseous tissue; reserving the name "hyperostosis" for the swelling of the whole or nearly the whole of the canal.

According to these conclusions the exostosis of the ear can indeed be developed in the manner indicated by Dr. Cassells; therefore, we do not think it necessary to contest the manner in which he views the subject, notably in regard to the *rôle*, which he ascribes to the sub-periosteal abscess, in the etiology of aural exostosis; above all, of that form which has its seat near to the orifice of the external meatus.

As to the part of the auditory canal which our honourable *confrère* assigns as being the exclusive seat of the tumour; to the sub-periosteal abscess of the mastoid, which is, according to him, the point of its departure, and lastly to the transformation of the primary granulations into osseous tissue of the same form and of the same volume, we would be strongly tempted to view this description as a product of a vivid imagination, rather than the result of a profound examination of fact, did we not know the long-established authority which Dr. Cassells has justly acquired.

Conclusion.—It results from the study of the writings relating to the question of exostosis of the auditory meatus, that we have been able to gather together, as well as from the facts of our own experience, that the exostoses

Digitized by Google

of the auditory meatus can be developed, as much before as after the period of ossification of that canal.

Amongst the causes to which the development of these osseous tumours is attributed are, hereditary predisposition, inflammation or irritation, spontaneous or traumatic, primary or secondary, of the bones of the meatus and of the periosteum covering them.

The influence of the rheumatic, gouty, or the syphilitic diathesis has not been unquestionably established.

These tumours can arise from any part whatever of the osseous auditory meatus, but they most frequently spring from its posterior wall. Their degree of sensitiveness varies according to their situation in the meatus.

Deafness, and the subjective phenomena of the hearing, as well as the feeling of compression, of vertigo, &c., which occurs sometimes with exostoses in the ear, usually owe their origin to the occlusion of the meatus, and disappear as soon as the canal is made pervious. But there are cases where the symptoms are conditioned by coexisting inflammation of the tympanum, or of the external meatus.

The medical treatment of the exostoses of the ear rarely gives good results. Their surgical treatment, on the contrary, presents great resources, and can, in some cases, end in a radical cure.

Whatever be the proceeding in use, the harmlessness of surgical treatment has not been contradicted up till now, and it sometimes constitutes the only means of preventing a fatal issue.

WEDNESDAY, AUGUST 20, 1879.

INFLUENCE OF PREVENTIVE MEDICINE UPON THE GENERAL MORTALITY.

IN the able and suggestive Address on Public Medicine which Dr. Andrew Fergus has just delivered before the British Medical Association, there are a few points to which we would particularly call the attention of sanitarians, and especially of those who are under the impression that the annual death-rate of the population of England and Wales has been greatly diminished by the sanitary improvements that have been made throughout the country. It is well that we do not over-estimate the value of the work which has been accomplished in the department of hygiene, or otherwise we shall be tempted to relax our energies in the advancement of a science which, notwithstanding the facts about to be described, has done much, and promises to do a great deal more, for the public health.

In the above address Dr. Fergus has taken the trouble to analyse the whole of the Registrar-General's returns, and to make tables showing the proportion of deaths in each million of the population at the respective dates. One table shows the number of deaths per annum in England and Wales, from certain zymotic diseases separately from other causes taken together, for each million of the population, from 1838 to 1871.

Now, the most remarkable fact that strikes us in looking over these tables is the increase in the diarrhœal group, the addition of a new zymotic—viz., diphtheria—the small diminution of typhoid in the fever group, and the very stationary state of the total annual mortality of

Digitized by Google

the people from all causes during the period above-mentioned.

With respect to *diarrhœa*, and beginning with the small number of 225 deaths from that cause per million in 1838, we find that they amount to 472 in the last year (1842) of the first quinquennium. In comparing the first five years with the last two completed periods of like duration, it will be seen that the average for the first five years (1838-1842) was only 298; for the five years 1867-1871, it was 1,161; and for the last completed five years (1872-1876), as much as 998.

It may be mentioned that a few cases of dysentery are classed along with the diarrhœa cases, but in none of these periods was there the disturbing element of epidemic cholera. Thus, as Dr. Fergus remarks, it is not a little surprising to find that in the last period but one there were nearly four times as many deaths from this group as in the first period, and that even in the last quinquennium, there were more than three times as many deaths from the diarrhœal group as in the first period of five years. In measles and whooping-cough there is little or no variation, either one way or the other.

With regard to *measles*, the respective death-rates for the whole seven quinquennial periods specified vary from 375 (1872-76) to 540 (1838-40); while the death-rates for *whooping-cough* only vary from 472 (1847-51) to 542 (1862-66).

On the other hand, the death-rate from *scarlet fever* appears to have actually increased. During the first period of five years (1838-42) the figures are only 798. For the second quinquennial period they are 858; for the third, 902; for the fifth, 1,004; and for the sixth, 1,017; so that Dr. Fergus states the case rather too favourably when he says: "It is very satisfactory to observe that the last quinquennium has the lowest mortality—viz., 738 in the million of the population," especially as this rate was nearly equalled in the fourth period (1857-61), when the rate was only 796.

Typhoid does not come out at all well in the second table of deaths from fevers in 1869-76 per million of population, the death-rates for these years only varying from 311 to 390. With regard, however, to fevers in general, and typhus and simple continued in particular, there is a great diminution in the death-rate. Thus a glance at Table I shows that there has been an almost progressive diminution of "fevers" from the first and second quinquenniums, when the respective death-rates were 1,053 and 1,197, to the last or seventh period, when the rate was only 555. During the eight years 1869-76, typhus has gradually decreased from 193 to 49, and simple continued from 245 to 83. Dr. Fergus says, "there can be no doubt that this great improvement is owing to what sanitarians have effected." Some may be inclined to demur to this supposition, and will ask why the very fever, which is more than any other fever due to bad drainage, &c., should be the least affected by the sanitary improvements of the last ten years. Nor has our prevention of *small-pox* been, according to these statistics, so successful as it might have been. It is true that "the deaths from this disease vary from a maximum of 1,064 per million in the first year (1838), to a minimum of 49 in 1875"; but if we look at the table, we find that while in the two years 1838-39, the deaths for each million amounted to 1,653, in the two years 1871-2, they amounted to 1,845. Still there has been a marked diminution of the disease within the last 25 years, for while for the first quinquennium the rate was 577, the rates for the last five periods only varied from 187 to 283.

After the above statement the reader will not be so surprised to hear that very little change has taken place in the annual death-rates from all causes during the last thirty-five years. Thus the total deaths from all causes per million of the population were—in the first period (1838-42), 22,078, and during the last period 21,729; whilst for twenty years (from 1852 to 1871) the rate only fluctuated from 22,030 to 22,998. In reference to this fact Dr. Fergus cites a passage from the *Journal of the Institute of Actuaries* (July, 1878, vol. xxi., p. 120) in which Mr. A. H. Bailey remarks:—"In discussing this well-worn theme (mortality) the first feeling must be one of disappointment. An impression prevails, among medical men especially, that the duration of life is extending, and that it will be still further advanced by sanitary improvements. Is there any evidence of this? There has now been a systematic registration of deaths in this country for forty years, large sums of money have been spent upon sanitary improvements, and what has been the effect on the mortality of the population? Discarding individual years, in which there has been fluctuation in both directions, from various causes it happens curiously enough that in each of the three decennial periods 1841-50, 1851-60, and 1861-70, the rate of mortality has been identical, namely, 22·35 per 1,000 of the population."

Are we, therefore, to infer from this statement, and from the facts to which we have just drawn attention, that the sanitary improvements of the last twenty years have been barren of results, and have had very little influence upon the death-rate of the people in this country? Certainly not; for there are several reasons why the good effects of our sanitary reforms should not be so evident when the total annual mortality for the whole country from all causes, and during a long series of years, is taken into account, as they would appear if we compared the present and past mortality of particular districts in which the work of the sanitarian has been well or effectually carried out. Public hygiene, or State medicine, can only control the death-rate from a certain class of diseases—diseases the aggregate number of which is small when compared with all the other causes of mortality. Thus, passing over four years, details of which are not given in the Registrar-General's returns, the total annual mortality per million from croup, diphtheria, diarrhœa, cholera, scarlatina, fevers, measles, whooping-cough, and small-pox, amounts in round numbers to between four and five thousand from 1838 to 1876, while the total annual mortality per million from other causes, over which State medicine has little or no control, amounts to seventeen or eighteen thousand and upwards. Consequently, the diminution in the death-rate from some of the diseases above-mentioned must be very marked before it would have any perceptible influence upon the aggregate mortality of the whole population. Then, again, increase of population is to be taken into account. In 1838 the population was upwards of 15 millions, in 1876 it was upwards of 24 millions. But

Digitized by Google

great and rapid increase in the population of a country means overcrowding, with all its attendant evils, in certain districts, so that for obvious reasons the amount of disease sanitarians would have to contend with under these conditions would be much more, and the success of their labours much less, than would have been the case thirty years ago. Hence, to *keep down* the mortality under circumstances which, if unchecked, would undoubtedly raise it, is often as much as they can do; and in doing that they are performing a task the accomplishment of which is of no little benefit to the public health. Moreover, it should be recollected that the science of hygiene, as far as its practical and universal application is concerned, is at present in its infancy. There are still hundreds of places the sanitary state of which is little or no better than it was thirty years ago. In the meantime infectious and other diseases wait for nothing, and should an epidemic break out in any district unprepared for it, not only would the mortality in that district go towards swelling the general death-rate, but it would in a great measure cancel the influence which more healthy districts would otherwise have in diminishing that rate.

It is, therefore, only when we come to compare the recent and past mortality of certain towns or districts in which great sanitary improvements have been made, and in which no other cause has occurred to favourably influence the mortality of that town, that we can correctly guage the value of the work, and appreciate the labours, of the sanitarian. Even from *à priori* considerations, we might predicate the possible and salutary results of preventive medicine, for in respect of several diseases there is overwhelming evidence to show that the "excess of mortality has in all places been coincident with one or other of two definite local circumstances—(*a*) the tainting of the atmosphere with the products of organic decomposition, especially of human excrement; or (*b*) the habitual drinking of impure water." But we need not rest our argument upon any such considerations; we can appeal to positive facts. Over and over again has the Registrar-General and medical officers of health shown what a marked effect sanitary improvements have had upon the mortality of certain towns in which they have been properly projected and thoroughly carried out. It was only last week that we drew attention to the sanitary state of Llandudno, the authorities of which town had, by spending a large sum on a new system of sewerage, and a still larger sum on new waterworks, reduced its death-rate last quarter to 8 per 1,000 annually, while the mortality of the district in which Llanduduo is situated, was as high as 23 per 1,000.

THE ENGLISH REGISTRAR-GENERAL'S QUARTERLY RETURN.

THERE are many who will be curious to know whether the remarkably inclement winter and spring through which we have just passed have had much effect upon the health and prosperity of the people. It will therefore be as well to draw the reader's attention to the more important points of interest in the last Quarterly Return of Marriages, Births, and Deaths registered in the different divisions and districts of England and Wales.

We have first to note the low *marriage-rate*, which is a result not so much of the bad weather as of the agricultural distress and great depression of trade which have for some time prevailed throughout the country. This rate was, in the last winter quarter, only 11·6 per 1,000 of the population; the mean of the marriage-rates in the ten previous winters being 13·7. The marriage-rate has declined steadily since 1872, when the prosperity of the country was at its maximum. The present depression in the marriage-rate is the greatest that has been observed since 1842; and was especially marked in the mining and manufacturing districts. The same causes which diminish the marriage-rate have probably much to do with the increase of *pauperism*. Consequently we are not surprised to find that the total number of paupers relieved last quarter exceeded that in the second quarter of 1878 by 42,438. Not that this is to be taken as an indication of a progressive increase of pauperism, for the average proportion of the population in receipt of in-door or out-door relief last quarter did not exceed 28·9 per 1,000, while in the corresponding quarter of 1870 the proportion of paupers was equal to 43·1 per 1,000 of the population.

With regard to the *meteorology* of the last three months, the observations of Mr. James Glaisher, F.R.S., are particularly interesting. The weather throughout the quarter continued cold, wet, and sunless. The mean temperature was only 49·5°, and was 2·8° below the average for the corresponding period in 108 years. So low a mean temperature has not prevailed in the second quarter of any year since 1837. Mr. Glaisher calls attention to the unusually protracted continuance of cold weather, and reports that the mean temperature at Greenwich of the eight months ending June last was 41·65°, and was lower than in any corresponding period since the winter of the celebrated frost in 1813-14. The measured rainfall of the quarter at Greenwich Observatory was 10·3 inches, measured on 51 days, and exceeded the average amount in the corresponding quarter of 64 years by 4·5 inches. Only four times since 1815 has the rainfall of the second quarter exceeded 10 inches. And if we take the rainfall of the first six months of the year, it was no less than 17·3 inches, and was, without a single exception, greater than in any corresponding six months since 1815.

What has been the effect of this prolonged inclemency of weather upon the public health? Certainly not so bad as might have been expected. The fatality of diseases of the respiratory organs showed a marked excess throughout the quarter, whereas the *death rate* from the principal zymotic diseases was below the average. The death-rate, moreover, in England and Wales last quarter was equal to an annual rate of 21·1 per 1,000, and was slightly below the average rate in the ten preceding corresponding quarters. The lowest county death-rates were 16·7 in the extra metropolitan portions of Surrey, and 17·4 in Westmoreland, the rates in the other counties ranging upwards to 23·2 in Cumberland, 23·5 in Lancashire, 23·7 in Derbyshire, and 25·3 in Hereford. The cold spring weather seems to have been more fatal in the rural than in the urban population. Taking twenty of the largest English towns, the lowest rates of mortality last quarter were 15·

Digitized by Google

in Portsmouth, 18· in Brighton, and 19· in Leicester; whilst they were as high as 23· in Wolverhampton, 23· in Liverpool, 25· in Newcastle-on-Tyne, and 25· in Manchester. The zymotic death-rate was excessive in Newcastle-on-Tyne, and both the zymotic and infantile mortality great in Manchester.

With regard to the mortality at *different ages* it appears that the whole of the excess of mortality in England and Wales last quarter occurred among persons aged upwards of 60 years. The deaths of infants under one year of age were equal to 131 per 1,000 of the births registered, being rather below the rate of the nine preceding corresponding quarters. The lowest county rates of infant mortality were in Sussex (102), Essex (102), and Wiltshire (108); and the highest in Herefordshire (146), Buckinghamshire (165), and Leicestershire (169). In the twenty largest English towns it ranged from 93 and 120 in Portsmouth and Brighton, to 158 in Manchester and Oldham, and 197 in Leicester. "The rate of infant mortality in Leicester," observes the Registrar-General, "continues as excessive as ever; it was during last quarter more than twice as large as that which prevailed in Portsmouth." This fact is rather remarkable, considering that in the same report we find that Leicester showed one of the lowest rates of general mortality (19·9) among twenty of the largest English towns, and that the death-rate in that town from typhoid and typhus fever was unusually low. We believe this high rate of mortality has been attributed to the insanitary condition of the town, especially to bad drainage; but this can scarcely be the cause, considering that the general mortality of its population is below the average of other large towns.

It is satisfactory to note that the *zymotic* death-rate last quarter was not only below the average, but was lower than in any corresponding quarter since 1869, except that of 1873. The death-rate from zymotic diseases in the twenty large English towns did not exceed 0·9 and 1·3 in Portsmouth and Brighton, but was as much as 3·2 in Manchester, Salford, and Sheffield, and 4·0 in Newcastle-on-Tyne. Moreover, the fatality of *fever* (including typhus, typhoid, and simple continued) last quarter was no less than 54 per cent. below that which prevailed in the corresponding period of 1870. It ranged from 0·04 and 0·10 in Brighton and Leicester, to 0·40 in Portsmouth, 0·41 in Salford, and 0·42 in both Norwich and Liverpool. The chief *watering places* generally receive special notice in these excellent returns of the Registrar-General. The mean annual mortality in these places was 17·8 per 1,000, which was not only lower than the mortality of the country generally, but lower than that in the rural districts. This statement is highly satisfactory, considering the crowded condition of our watering places during many months of the year. Lastly, with regard to the health of *foreign cities*, it appears that whilst the death-rates were only 16·0 in Philadelphia, 16·9 in Christiania, and 17·6 in Brooklyn, they were as high as 39·9 in Munich, 42·5 in Buda-Pesth, and 44·7 in St. Petersburgh. "The rates of mortality in the American cities were again remarkably low, notwithstanding the excessive fatality of zymotic disease; so low as to suggest grave doubts whether the American system of registration affords trustworthy mortality statistics."

Notes on Current Topics.

The London Water Supply.

One of the latest subjects which engaged the serious attention of Parliament before its prorogation on Thursday last, was that of the London Water Supply. Mr. Fawcett following the course of our arguments last week in an able speech, made out a strong case against the Companies, whose business it is to supply London with water. He properly observed that whatever their rights may be, they certainly possess no exclusive monopoly of this great necessity of life; the vast importance of which was manifest as he proceeded to divide the subject into that which concerns the health, the morals, the security, and the pockets of four millions of people. This fourfold degree of importance, necessarily arising out of the fact that contaminated water is extremely dangerous to health; that intemperance is surely promoted by the want of a refreshing unintoxicating beverage, that the danger of fires is considerably increased by the difficulty of extinguishing them, and that a high price for an indespensible necessity is a serious matter for the poor. To these several objections may be added another; that of the system of storing water for forty-eight hours in unwholesome and expired receptacles; a grievance much complained of by the working classes, and in every way indefensible. Mr. Fawcett's resolution "that, in view of the fact that the Metropolitan Board of Works has been unable to pass any measure dealing with the water supply of London, this House is of opinion that it is a subject which ought, without delay, to be dealt with by the Government," was at once met by Mr. Cross. The Home Secretary with an explicit promise to inquire into the subject during the Recess, and to state next Session at what conclusion he had arrived, with this understanding that the Government would fairly consider all the points urged, Mr. Fawcett consented to withdraw his motion.

Murder of an Italian Physician.

The "kill or cure" system which is supposed to have existed in bygone ages has just received a cruel and literal illustration in Italy.

At the last assizes in Spoleto a trial for murder took place under the following circumstances:—A certain Signor Marcucci, of Spoleto, a gentleman of good property and position, called in a physician of the place, one Dr. Domenicis, to attend his only son, who was seriously ill. If, said Marcucci, the young man recovered, Dr. Domenicis should receive two thousand francs; if, on the other hand, the patient died, Dr. Domenicis should be killed! It cannot be for a moment seriously contended that such an alternative was accepted in good faith by the doctor. He would probably treat the case in the ordinary manner, and smile at the idea of such a threat being carried out. However, Signor Marcucci proved to be a man of his word, for the lad died, and Marcucci thereupon did kill Dr. Domenicis. He coolly murdered him, with apparently no attempt to conceal the act. The unfortunate physician left a widow and family behind him. But no compunction or pity availed to

Digitized by Google

stay Marcucci's hand. And now what does the reader suppose was the sentence pronounced on this barbarous ruffian in an Italian court of justice? He was condemned to five years' imprisonment and the payment of a five of twenty-five thousand francs, to be given as damages to the doctor's widow.

Marcucci, being well acquainted with the shams in Italian law courts, doubtless imagined that the matter would be treated as a breach of contract, in which he was the sufferer, and that probably a fine for his rashness might be the most serious effect he would experience. If this be so he was not far wrong in his supposition. Had the fear of a murderer's death been before him, as it should be in any civilised country, he would doubtless have thought more of his own neck and still more of the value of an innocent life.

The Sanitary Congress.

THE Sanitary Congress and Exhibition of the Sanitary Institute of Great Britain will be held at Croydon, from October 21 to November 8 inclusive. Dr. Richardson, F.R.S., has been elected President of the Congress, and a large and influential Committee, with Mr. John Corry Chairman, has been formed. Amongst the Vice Presidents are the Archbishop of Canterbury, Earl Percy, M.P., the Earl of Egmont, the Bishop of Rochester, Messrs. George Cubitt, M.P., Alexander M'Arthur, M.P., W. Grantham, Q.C., M.P., J. Watney, M.P., and Sir Trevor Lawrence, Bart., M.P. The Sanitary Congress is divided into three sections, as follows:—Section 1: Sanitary Science and Preventive Medicine; President, Dr. Alfred Carpenter. Section 2: Engineering and Sanitary Construction; President, Captain Douglas Galton, F.R.S. Section 3: Meteorology and Geology; President, Mr. J. G. Symons, F.R.S. Arrangements have also been made for one or more lectures, one of which will be delivered by Professor Corfield. Croydon has the advantage of excellent public hall accommodation, which will doubtless be utilised for exhibition and meeting purposes; the town is, moreover, very accessible from all parts by rail, and those who know Dr. Carpenter will have the assurance that his energies and capacity for work will leave nothing undone to merit success.

Health of English Watering Places.

IN his last Quarterly Return the Registrar-General gives a very satisfactory account of the sanitary condition of many English watering places and summer resorts. We are told that the mean annual mortality in these places was 17·8 per 1,000 of the population, which was not only lower than the mortality of the country generally, but lower than that of the rural districts. Littlehampton, Lyme Regis, Worthing, Bognor, Clifton, Buxton, Tunbridge Wells, Malvern, Weston-super-Mare, Torquay, Herne Bay, Yarmouth, Isle of Wight, Weymouth, Dover, Margate, New Brighton, Deal and Walmer, Penzance, Portsmouth, Eastbourne, Scarborough, and Lowestoft, experienced an exceptionally low mortality, the respective death rates for these districts varying from 10·6 per 1,000 in Littlehampton, to 17·7 in Lowestoft. On the other hand, the death-rate was above the average in Brighton, Ramsgate, Cheltenham, Matlock, Whitby, Bath, Bangor, Aberystwith, Southend, Dawlish, Hastings, Ilfracombe, Sidmouth, Rhyl, Exmouth, Tenby, Llandudno (Crenddyn sub-district), Folkestone, and Leamington, the death-rates in these districts varying from 18·0 in Brighton, to 24·0 in Leamington. The mortality is for the district in which the watering place is situated, and is generally lower than that in the watering place itself. In Llandudno, however, the reverse is the case, for the mortality in Llandudno last quarter was equal to only 18 per 1,000 annually; whereas the mortality of the Crenddyn sub-district, in which it is situated, was as high as 23 per 1,000. This highly satisfactory condition of Llandudno is owing to the enterprise and liberality which the town authorities have shown in undertaking various sanitary improvements. By spending upwards of £30,000 on a new system of sewerage, and a still larger sum on new water-works, the town has exhibited great public spirit, and is "thus entitled to reap, as it does, the credit and benefit it has so well earned!"

"Presence of Mind."

UNDER this heading, the *Scientific American* quotes the following short rules given by Professor Wilder for action in the case of accidents. For dust in the eyes—avoid rubbing, dash water into them. Remove cinders, &c., with the round point of a lead pencil. Remove insects from the ear by tepid water, never put a hard instrument into the ear. If an artery is cut, compress above the wound; if a vein is cut compress below. If choked, get upon all fours and cough. For light burns, dip the part in cold water; if the skin is destroyed, cover with varnish. Before passing through smoke, take a full breath, and then stoop low, but if carbon is suspected, walk erect. Suck poisoned wounds, unless your mouth is sore; enlarge the wound, or better, cut out the part without delay. Hold the wounded part as long as can be borne to a hot coal, or end of a cigar. In case of poisoning excite vomiting by tickling the throat, or by water or mustard. In case of opium poison give strong coffee and keep moving. If in the water float on the back, with the nose and mouth projecting. For apoplexy raise the head and body; for fainting lay the person flat.

"Brevity is the soul of wit," so the Professor's maxims have, at least, the merit of being short, and perhaps many will think that some of them are more easily preached than practised—to wit, floating on your back in water when you cannot swim, and cutting off your own finger, or putting into the wound a live coal, when you have been bitten by a mad dog!

More Hypodermic Injections!

WHEN shall we hear of the last novelty in the way of hypodermic injections, and of the wonderful cures resulting from them? One of the latest instalments of hypodermic therapeutics is the subcutaneous injection of coffee, as reported in the *New York Medical Record*. Dr. Pallen has injected a solution of coffee in two cases. In one case he injected 20 ℥ of the fluid extract of Java coffee into the epigastrium, in order to control the vomiting induced by taking morphia. "Fifteen minutes afterwards the

Digitized by Google

patient, who had previously been seriously prostrated, expressed herself as decidedly better, having vomited but once during that time. An additional injection of the same amount was then made into the abdominal parietes. She was free from nausea in less than an hour, and never vomited after the second injection of coffee." In the second case the patient—a confirmed morphia eater—had taken an over-dose of morphia, but we are not informed whether the symptoms were very severe. Thirty minims of coffee were injected into the epigastrium, and fifteen minutes afterwards the same amount was injected over the deltoid. "In two hours no symptoms of morphine could be detected." In this case, moreover, a very considerable abscess made its appearance in the shoulder, as well as inflammatory indications in the epigastrium, accidents which Dr. Pallen attributes to the not warming the solution before injection.

Rival Methods of Treating Asthma Hypodermically.

WHILE on the subject of hypodermic injections we cannot refrain from drawing the reader's attention to two very different plans recently advocated in the treatment of this affection, each of which is alleged to be remarkably efficacious. In several articles contributed to *L'Union Médicale*, July and October, 1878, Dr. W. Huchard has strongly recommended the use of subcutaneous injections of morphia in cases of asthma. He finds it gives marked relief in the spasmodic efforts at respiration, and argues that it exerts a special influence on the respiratory system. In his opinion, it relieves not only asthma but other forms of dyspnœa, not so much by its hypnotic action as by its direct action on the lungs, for clinical experience establishes the fact that it facilitates respiration. On the other hand, in the case of a man who had suffered much from asthma, and for which various remedies had been given without avail (including subcutaneous injections of morphia) it occurred to Dr. Martelli (*Gaz. Méd. Ital.*) to inject some of Fowler's solution of *arsenic*—one part to two parts of water. "The effect was remarkable; the paralysis at once ceased (la paralysie cessa à l'instant); and by the time two drachms of the solution were used the condition of the patient was considerably improved. After a while the attacks returned, but were again successfully treated by the injections!

The New Arctic Expedition.

WE learn that another Arctic Expedition is proposed, in which balloons are to be utilised for the purpose of attempting to accomplish the difficult project of reaching the Pole. Previous to the departure of the Expedition under the command of Capt. Nares a correspondent drew attention (*Med. Press*, Jan. 27, 1875) to the question of alcoholic stimulants as a portion of the rations served to the crews, suggesting that a careful record should be kept of any circumstance arising during the voyage which might serve to elucidate this much-vexed question; and subsequent to the return of Capt. Nares's expedition several lengthy communications on the subject appeared in our columns. The departure of this new expedition, let us hope, will not take place until some authoritative evidence is sought out, and acted upon, relative to the use or non-use of alcoholic stimulants as part of the daily rations of the crews of the exploring ships. The last expedition was scarcely a successful one, and there were not wanting those who attributed its comparative failure to the use of alcoholic beverages, even more than to the unfortunate omission of the necessary limejuice during the perilous sledging journeys over the ice. It has been announced that Lord Derby takes great interest in the proposed venture, and has promised to contribute towards the cost. At a recent meeting of the Central London Committee Mr. J. H. Puleston, M.P., was appointed Treasurer, Mr. W. S. Vaux, F.R.S., and Dr. Alger, LL.D., being the Hon. Secretaries.

Simple Treatment of Sciatica.

ACCORDING to the *Journal de Médécine de Bruxelles*, Dr. Ebrard, of Nimes, has been in the habit of treating all his cases of sciatica and neuralgic pains with an improvised electric apparatus, consisting merely of a flat iron and vinegar. The iron is heated until sufficiently hot to vaporise the vinegar, and is then covered with some woollen fabric, which is moistened with vinegar, and the apparatus is at once applied to the painful spot. The application may be repeated two or three times a-day. As a rule the pain disappears in twenty-four hours, and recovery ensues at once. We give this note for what it is worth, but, as we are rather sceptical on such matters, certainly doubt the alleged efficacy of this very simple treatment. It puts us in mind of the old domestic remedy of ironing the back in lumbago, and most probably it is about as valuable as any other old women's remedy.

The Metropolitan Hospital Sunday Fund.

THE Council of the Hospital Sunday Fund may very fairly be congratulated upon the success which, in spite of adverse circumstances, has attended their efforts to benefit the medical charities of London. A fortnight ago we stated that the sum collected had somewhat exceeded that of the previous year. We are now enabled to add that, since the Distribution Committee completed its labours, further sums have come in, amounting on the whole to £1,500, thus bringing up the total to very nearly £26,500. This is a very gratifying circumstance, since it has enabled the Council to make a *pro rata* addition to the sums originally awarded to the several institutions.

A DEATH from cholera in a middle-aged man was registered in London last week.

A HAWKER died last week in Westminster of senile gangrene, at the advanced age of 100 years.

SMALL-POX caused but 5 deaths in London last week, 3 in Dublin, and not one in any of the other large towns.

THE mortality was again low throughout the United Kingdom last week. Of the large towns Portsmouth and Wolverhampton showed the extraordinarily low rate of 10 per 1,000. Of the others, Edinburgh stood at 15, Glasgow

Digitized by Google

16, London 18, Dublin 24, and the highest of all, Sunderland, 27.

The Health of Hastings.

We have received the last quarterly report of the Medical Officer of Health for Hastings and St. Leonards. It is not nearly so favourable as those for the two winter quarters, showing 19·2 deaths per 1,000 of the population, very high in fact for these watering places at any season of the year. It is customary to attribute everything to the weather, and the Hastings health officer does not attempt to make himself original by seeking some other cause for this high death-rate. Oddly enough, the rains have had the effect in other parts of the United Kingdom of producing an exceedingly low rate; but the Hastings sewers are probably not amenable to the scouring of storm waters, and so the medical officer decides upon fixing the obloquy upon "the unseasonable weather lately experienced."

H.M. the Queen visited the newly arrived Zululand invalids at Netley Hospital last week, and personally affixed the Victoria Cross on the breast of one of the gallant defenders of Rorke's Drift.

In consequence of the resignation of Dr. Sieveking as Examiner in Medicine at the Royal College of Physicians of London, Dr. Broadbent, of St. Mary's, Dr. Dickinson, of St. George's, and Dr. Gee, of St. Bartholomew's Hospital, have announced their candidature for the appointment.

The rates of mortality, in the principal foreign cities according to the most recent weekly returns, were—Calcutta 22, Bombay 31, Madras 26; Paris 24; Geneva 15; Brussels 26; Amsterdam 17, Rotterdam 25; The Hague 18; Copenhagen 21; Stockholm 22; Christiania 22; St. Petersburgh 34; Berlin 44, Hamburg 24, Dresden 19, Breslau 32, Munich 34, Vienna 24, Buda-Pesth 39; Naples 31, Turin 32, Venice 23; Alexandria 38; New York 27, Brooklyn 30, Philadelphia 24, and Baltimore 31 per 1,000 of the population. Small-pox caused 19 deaths in St. Petersburgh, and 11 in Paris.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

"Capping" the Medical Graduates at Aberdeen.—The ceremony of capping the medical graduates at the close of the summer session took place in the hall of Marischal College on Saturday, the 9th inst., in presence of a large assemblage, chiefly composed of ladies. Principal Pirie presided, and was accompanied to the platform by Professors Pirie, Ogston, Trail (theology), Trail (botany), Ewart, Struthers, Christie, Forbes, Davidson, Stephenson, Pirie (mathematics), and Brazies. The conduct of the undergraduates was remarkably good—chorus singing, stamping of feet, and stick-rapping being completely avoided. At the close of the proceedings the Principal complimented the students on their behaviour, and said he was sure that every one of the members of the Senatus and of the Faculty of Medicine must have been highly satisfied with the mode in which the under-graduates had behaved themselves.

Treat to the Inmates of the Glasgow City Asylum and Poorhouse.—On the 13th inst., the inmates of this establishment had their annual summer treat. The party, consisting of nearly 100 insane, besides their attendants, and about 150 of the aged and more deserving poor, embarked on board the steamer *Dunrobin Castle*, and proceeded to Loch Goilhead, where suitable arrangements had been made for their reception. The weather, at first very threatening, fortunately cleared up, enabling the party to enjoy the sail and the beautiful scenery on the route. After spending upwards of two hours pleasantly on shore, they returned in the evening evidently delighted with their day's excursion. A number of the directors of the institution accompanied the party.

Hospital Patients under their own Medical Attendants.—A meeting of the managers of the Thomas Walker Hospital, Fraserburgh, was held on the 8th inst., Mr. John Park presiding. It was resolved, after a good deal of discussion, to permit all the medical practitioners in Fraserburgh and the contributing parishes to send patients to the hospital, and to attend them there, it being understood that the patients themselves shall remunerate the gentlemen they employ, if they are in circumstances to do so. This is a scheme to be commended, and ought to work well if more universally adopted throughout the country.

The Lectureship in Natural Science in the Aberdeen Free Church College has been conferred on Dr. John McKendrick, Professor of the Institutes of Medicine in Glasgow University, for session 1879-80, under the Banchory Bequest, in succession to Dr. Lauder Brunton, of London. The appointment has given great satisfaction, both in Aberdeen and Glasgow, where Dr. McKendrick is well known and appreciated.

Dr. Russell's Public Health Lectures.—The lectures recently delivered by Dr. Russell, Medical Officer of Health for Glasgow, "On the Theory and General Prevention and Control of Infectious Diseases," have just been published by Mr. Maclehose. Details necessarily omitted in newspaper reports, are supplied in full, and in this form the lectures ought to prove interesting to sanitarians. The text is illustrated by a number of well-executed plates.

Health of Port Glasgow.—Report by Dr. Littlejohn.—In April last, when several cases of fever occurred at Port Glasgow, Dr. Wallace, Medical Officer, Greenock, reported to the Greenock Police Board on the objectionable practice of conveying patients through the streets of Greenock to the Greenock Infirmary, and to the further fact that the fever wards in the hospital were filled with fever patients from Port Glasgow, to the exclusion of Greenock cases. Dr. Littlejohn was thereupon instructed by the Board of Supervision to report. His report has just been received. It recommends the local authority of Port Glasgow to apply to the Greenock local authority for power to send patients to Craigie Knowes Hospital, and to the Greenock authority to complete the same. In a note from the Secretary of the Board of Supervision, accompanying this report, they urge the desirability of Port Glasgow, Greenock, and Kilmacolin, combining for a common hospital.

The Registrar General's Returns.—The weekly return

Digitized by Google

of births, deaths, and marriages in the eight principal towns in Scotland, for the week ending Saturday, August 9th says: "The death-rate in the eight principal towns during the week ending with Saturday the 9th August, 1879, was 16·6 per 1,000 of the estimated population. This rate is 3·4 under that for the corresponding week of last year, and 1·0 below that for the previous week of the present year. The lowest mortality was recorded in Greenock, viz., 9·5, and the highest in Paisley, viz., 27·6. The mortality from the seven most familiar zymotic diseases, at the rate of 1·8 per 1,000, was slightly below that for the previous week. Whooping-cough was the most prevalent of these diseases. Fifty-five deaths resulted from acute diseases of the chest, being nine less than for the previous week. The mean temperature of the week was 55·7°, being 2·7° below that of the week immediately preceding, and 6·5° below that of the 32nd week of 1878.

Glasgow Death-Rate.—The death-rate of Glasgow during the week ending the 9th inst. was 16 per 1,000 per annum, being the same as for the preceding week. For the same week of last year the death-rate was 22 per 1,000.

Medical Officer's Report for Hillhead.—During the month of July Dr. Christie reports that twelve births and six deaths were registered as having occurred within the burgh, being at the annual rate of 19·07 births, and 9·53 deaths per 1,000 of estimated population. Of the deaths one only occurred under the age of 5; the ages of the others being 44, 53, 56, 73, and 74. The causes of death were diarrhœa, congestion of the lungs, pleurisy, peritonitis, cancer, and paralysis. During the year, in so far as it has transpired, the burgh has been remarkably free from epidemic disease, there having been only two deaths from diseases of this class in January. There is nothing in the returns for July calling for any special observation. The death-rate is very low, though a little higher than that of May and June. All the deaths were certified. There are several cases of whooping-cough in the burgh and neighbourhood.

Correspondence.

PROF. McKENDRICK ON MEDICAL REFORM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Your Northern correspondent, in your issue of the 6th inst., criticises my address at the graduation ceremony at the University of Glasgow on the 31st ult., and he concludes as follows: "It seems he would approve, in short, of any scheme which would not disturb the monopoly of the universities nor diminish the emoluments of the professors."

I do not think it right to allow a statement so ungenerous and so misleading to pass unnoticed; and, therefore, I beg leave briefly to state in your columns my opinion on this vexed question of medical reform.

I cannot admit that the public are in any way suffering from the present arrangements as to the admission of men into the medical profession. I have seen no proof that unqualified men are admitted, and although the "pass" standard is higher at certain boards than at others, I do not think that a man who is not fit to practice medicine, surgery, and midwifery can possibly get into the profession by any of the nineteen portals at present existing, more especially if he take a "double qualification." Thanks to the interest taken in recent years in medical education, and to the visitations of members of the general council, all the boards are keenly alive to the fact that all their doings are scrutinised, and that they dare not pass men below a certain standard of excellence. To maintain this healthy state of things, I would urge efficient supervision by the Medical Council, or failing that, giving the requisite guarantee of thoroughness in the examinations; I would support the proposal for a State examination on practical subjects passed subsequent to obtaining a diploma or diplomas from one or more of the medical authorities presently existing.

The agitation for a uniform standard of qualification has arisen in the profession itself, and it is, I believe, an outcome of certain notions regarding education and centralisation which have recently become prevalent, and which manifest themselves, for example, in Scotland in our School Board system. The remedy proposed for the supposed evils of the present state of things, is that of a minimum qualification granted after examination by a conjoint board. I object to the principle of conjoint boards for the following reasons:—

1st. Because it tends towards a minimum standard of qualification, lower, in all probability, than the lowest at present existing in the United Kingdom.

2nd. Because it discourages the scientific culture and the training in various departments of natural science which have hitherto been one of the most striking features in the education of most medical men.

3rd. Because it will operate prejudicially on teachers, reducing them to the position of men simply training students for examinations, instead of leaving a man free to teach those views that seem to him to be the truth.

4th. Because, by favouring a minimum standard of qualification, and by discouraging men from connecting themselves with the literary and scientific culture of the universities, it will place medical men lower in the social scale than they are at present.

5th. Because, in the selection of examiners to form the conjoint boards, there will, in all probability, be a new field for canvassing, testimonial-giving, and intrigue, and in which party-feeling of various shades will undoubtedly find a place.

These are my chief objections to the principle of the conjoint board system, and I therefore oppose the scheme, not from any selfish desire to maintain "monopoly," or to avoid diminishing "emoluments," but because I firmly believe the proposed change would do injury to the medical profession.

As I stated in my address, I think medical reformers are going in the wrong direction. Instead of levelling down they should attempt level up. Instead of degrading all to a uniform level they should remove the lower platforms at present existing, and insist on all attaining a high elevation. By doing so medicine would still be a learned profession, instead of the mere trade and matter of business to which many propose to degrade it.

I have no doubt the answer to this will be that the minimum qualification need not deter men from proceeding to take the degrees of the Universities. That is quite true; and I have little doubt that under the new system some ambitious men, more especially those with sufficient pecuniary means, would aspire to the honorary degree; but the great majority, I am convinced, would not do so. With considerable experience of medical students during the past ten years, I think that in the proposed state of things, most would be satisfied with the L.C.B.—the Licentiateship of the Conjoint Board—and in a short time the gulf between the consulting physicians and surgeons of the metropolis and of great cities, and the rank and file of the profession would become greater than at present.. Such a state of matters would, I fear, neither contribute to the welfare of the public nor to the social position of the profession.

I am not in favour of any monopoly on the part of the Universities as regards teaching. Every encouragement should be given in the way of recognition of the lectures of young and able men on general or special subjects; they should be affiliated to our seats of learning as teachers or examiners, and there should be "free trade" in teaching as far as possible. The teaching and working power of the Universities should be developed to the greatest possible extent. But along with this I would be glad to see the time when all medical men entered the profession by graduating at a university. The corporations should have nothing to do with admitting men into the profession. They have served their time, and they can still do good service by their libraries and museums, and by encouraging research in medicine and surgery with the ample funds they have at their disposal. So long as they exist as licensing bodies, and try to carry out functions which were at one time useful, but are now obsolete, there will be an outcry for single or triple-portals and minimum qualifications. My contention is, that all medical men should have a University

Digitized by Google

degree. It is remarkable that all religious denominations and legal fraternities are aiming at this standard, whilst those who guide the medical profession are following a downward path. The result will be that, by-and-bye the medical licentiate will not be on the same social platform as the minister or the lawyer, and he will be estimated in popular opinion at the value he sets on himself.

Such a scheme of medical reform as I have indicated would of course be impossible in England under present arrangements. To give to the middle-class of England the advantages we have long enjoyed in Scotland, the University of London should be altered as follows:—

1st. It should become a teaching institution, with double professorships for such subjects as chemistry, botany, zoology, and comparative anatomy, anatomy, physiology, and materia medica and pharmacy, having two great buildings in different parts of London devoted to this purpose.

2nd. It should allow students to pursue professional studies under certified teachers in the various hospitals, as at present.

3rd. It should reduce the standard of examinations to a somewhat lower level.

By the first arrangement men would be obtained for the chairs who were teachers by profession, and who were willing to devote their whole time and attention to the duties of their office—conditions absolutely requisite for the efficient teaching of scientiffc subjects. Thus, the means of a University education and the privilege of getting a University degree would be supplied to students from the metropolis and South of England. In addition, I cordially support the movement for granting a charter to the Owens College, Manchester, and affiliated institutions, as it would meet the wants of the midland counties and of the North. I regret to observe that in the proposed charter the right of granting medical degrees has been withheld. By such arrangements, the large influx of English students to Scotland would be diminished and the teachers north of the Tweed would consequently suffer.

Some years ago, when my attention was first directed to the conjoint board system, I was disposed to be in favour of it; but I confess that the more I have studied the question, more especially in the light of recent utterances as to "minimum qualifications," the more convinced I become that it would lower the scientific and social position of the profession.

I am, Sir, yours truly,

University of Glasgow, Aug. 12, 1879. JOHN G. McKENDRICK.

THE UNITY OF POISON IN SCARLATINA, PUERPERAL FEVER, TYPHOID, DIPHTHERIA, ERYSIPELAS, ETC., ETC.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—While I was preparing my paper on the above subject, which appeared in your No. of July 30th, I met with the following in Dr. Farquharson's lecture "On the various Forms of Skin Irritation, due to the Administration of Drugs":—"Quinine eruptions are not only terrifying, but from their suddenness are extremely irritating and uncomfortable. They may be divided into two classes. The first are erythematous in character attended by most distressing itching and tingling, and *resembling scarlet fever both in the appearance of the rash, and in the free desquamation* which follows."

The second assumes a more *measly* aspect, being occasionally papular, but more generally suggestive of that form of urticaria not in wheals, but in discrete rose-red patches spreading universally over the skin, and occasionally attended with marked gastric disturbance.

Through the kindness of Dr. Cheadle, I am able to show you the drawing of a case which differs from others on record in the dose required to produce an abundant crop of thickly scattered pink stains.

The patient, a lad aged 12, had taken about ten grain doses. But usually a small quantity is sufficient. Thus, in a case in the practice of Mr. Garraway, one grain produced a severe *erythematous* rash; Dr. Skinner twice produced a *scarlatinoid* eruption by a grain and a-half. Lightfoot observed a *similar* accident half an hour after a grain and half had been taken. Dr. Newman has seen even half a grain produce *erysipelatous redness*, and *œdema of the right side of the face*, beginning half an hour after the dose had been swallowed, and lasting twelve hours. It is curious to note that a large proportion of the victims of this idiosyncrasy have belonged to the female sex.

Here are abundant proofs of the different effects of the one drug on different persons (the cutaneous effect is alone recorded), and apt illustrations of what I seek to explain in my papers—Unity of poison, differentiation in the symptoms of the inward action of that poison, no matter what it may be. The connection also between this effect of quinine, and that of eating tomatoes, high game, &c., is so manifest that I would here merely call attention to it, preferring in a future and more extended communication to give what I consider to be the *rationale* of action by which in some cases toxæmic scarlet or typhoid fever is produced, while in others there are erysipelas, and less grave manifestations.

Reading Dr. Farquharson's words, reminds me of what my revered master, the late Dr. Stokes, used to state to us his pupils, that he has seen scarlatina patients attacked with measles, the latter running its acute course, and when finished, the former recommencing where it had left off, and then continuing to the end, also *vice versâ*.

I am, yours &c.,

G. DE GORREQUER GRIFFITH.

9 Lupus St., Belgravia, London, S.W.

Literature.

FIELD ON DISEASES OF THE EAR. (a)

THE medical practitioner will not often take up a book on a special subject, the perusal of which will afford him more pleasure and satisfaction than the one to which we would now draw his attention. That a work of this kind was particularly needed is evident from the fact that there exists great ignorance of aural surgery among the bulk of the profession. This ignorance has been owing partly to the general but mistaken notion that most cases of deafness are beyond the power of the surgeon to cure, and partly to the lack of really good and practical works on the subject. This want Mr. Field has well supplied. He has succeeded in placing before the reader the result not only of his own experience, but also that of other aural surgeons, both British and foreign; and this he has done in such a clear, concise, and instructive manner that the reader cannot fail to find the work of the greatest assistance to him in practice. It should be also remarked that this little treatise is not merely a compilation, but in a great measure embodies the results of the large experience which the author has had in this class of diseases. Indeed, a great merit of the book, and one of its most instructive features, is the fact of its containing a number of clinical reports illustrative of the diagnosis, symptoms, and treatment of the affection under consideration.

In the preliminary chapter there is a brief but very intelligible description of the anatomy and physiology of the ear—a subject the consideration of which could not well be dispensed with, as there is no part of anatomy so soon forgotten as that of the organ of hearing. The author then proceeds to give directions for the examination of a patient suffering from aural disease—a point of the greatest importance, and without a knowledge of which it is impossible to interpret rightly the symptoms complained of, and to treat them successfully.

There are also some good chapters on chronic inflammation of the middle ear, the various forms and consequences of otorrhœa, and affections of the internal ear, including an excellent description of the pathology and symptoms of Ménière's disease.

The chapter on tinnitus aurium is worthy of special attention, and contains a full account of the literature of the subject, and of the various remedies that have been employed in the treatment of that troublesome affection. In some cases this disease proves very intractable, but "whether the sound arise from cerumen, debility, chlorosis, aural catarrh, or any

(a) "Diseases of the Ear." By George P. Field, M.R.C.S., Aural Surgeon to St. Mary's Hospital, &c. Second Edition. London: Henry Renshaw. 1879.

Digitized by Google

other cause, if the treatment be thoughtfully adapted to the peculiar circumstances of the case, a cure may, as a rule, be hoped for."

With regard to the treatment of ear diseases in general, we observe that Mr. Field displays much judgment, that he gives great attention to the constitutional treatment of the patient, and is in short guided by those sound principles of general pathology and therapeutics which should mould the practice of every specialist.

With regard to the employment of blisters and other forms of counter-irritation, we quite agree with him in attaching much importance to the use of an agent that is too much neglected at the present day. Among other observations on this subject, Mr. Field says: "Two main facts stand out prominently for our guidance as the result of clinical experience, namely, first, the teaching of ages has shown that, when we desire to effect the absorption of effused serum no remedy is so successful as counter-irritation. . . . Nor are these facts in contradiction with the great physiological truth first taught by Hilton, namely, that the blood-vessels of the skin sympathise, by means of their vaso-motor nerves, with those of the organs beneath. For we learn, clinically, that the irritation of a blister on the skin of the thorax produces a similar irritation of the vessels of the pleura, with a change of nutrition in both parts of the same nature, but not to the same degree. . . . In like manner the blister behind the external ear affects the nutrition of the internal ear."

Although we have had good reason to speak well of Mr. Field's work we do not wish to imply that it is faultless. As a guide to the young practitioner in the management of this troublesome and often puzzling class of affections it would have been better had the author put in a clearer light than he has the differential diagnosis of the various diseases to which the organ of hearing is liable. No doubt the number of clinical reports scattered throughout the work partly makes up for this deficiency; but in the next edition of this book, which we think will soon be called for, the insertion of a chapter on diagnosis would be a decided and very useful improvement.

MEMOIRE SUR LES AFFECTION SYPHILITIQUES PRECOCES DES CENTRES NERVEUX. (a)

M. Mauriac is well-known in France and elsewhere as one of the most worthy successors of the celebrated school of Parisian syphilographers. He is physician to the world-renowned Hôpital du Midi, which is to say that his opportunities for observation are unequalled; and, as his medical knowledge is of the most finished order, his observations are at once most perfect and valuable. His last work before us well sustains Dr. Mauriac's reputation. Its conclusions are as follows, and they are merely a *resumé* of the accurate observations contained in his excellent work.

1. Syphilis may attack the nerve centres at an epoch very near that of the primary accident.

2. Cerebro-spinal syphilitic affections are *precocious* when developed in the virulent period of the disease; that is, during the two or three first years.

3. There are degrees in the precocity of such cerebro-spinal syphilitic affections; the first comprehends those arising in the first twelve months; the second those which are developed in the second or third year of the constitutional disease. Statistics would seem to prove that those of the first degree are commoner than those of the second; but these results are of but little importance.

4. Among the visceral precocious lesions of syphilis, the cerebro-spinal affections are incomparably the most frequent.

5. They are also the most dangerous. Their gravity is not in proportion directly with the age of the diathesis: those which supervene in the first months of the disease are as redoubtable as those which belong to the most tardy phases of it.

6. All the forms, and degrees, and phenomenal combination which make up the symptomatology and process of the effects of syphilis on the neuro-axis are observed as well in precocious cerebro-spinal affections, as in the later ones.

7. There are, however, certain symptomatic formulæ which seem predominant. The most frequent are those which consist in an attack of hemiplegia affecting the whole of one side.

8. Among the attacks of hemiplegia, that which is constituted by the combination of aphasia with right hemiplegia is more prevalent than the rest.

9. The paralytic forms are much more numerous than the convulsive or epileptic in precocious cerebral affections.

10. In these syphilitic cerebro-spinal affections, mental lesions and inco-ordination of movements are never systematic as in insanity, general paralysis, or locomotor ataxia.

11. The absence of this systematic order in cerebro-spinal syphilitic affections ought to be regarded as one of their principal characters. Only *one* restriction is to be made in favour of the co-existence of aphasia with right hemiplegia.

12. The precocious determinations of syphilis on the spinal cord are much less frequent than those on the brain.

13. The circumscribed or diffuse suffusions of hyperplasia of the cortical layer of the brain and pia mater, the syphilitic alteration of the Sylvian arteries and consecutive softenings; such are the lesions which appear to belong to precocious syphilitic cerebro-spinal affections.

14. In certain cases of precocious cerebro-spinal affections followed by death, no lesion was found: but at that time syphilis of the arteries was unknown. It is to be supposed that death was caused by a sudden anæmia, which extinguished at once the foci of innervation indispensable to life.

15. We can only make very vague conjectures as to the causation of precocious cerebro-spinal syphilitic affections. In the majority of cases, the primary accident has been very benignant, as well as the consecutive cutaneous and mucous manifestations.

16. The general progress of the constitutional disease is not modified by the appearance of precocious syphilitic accidents of the nervous centres. The other manifestations are produced before, during, or after the determination on the neuro-axis, without undergoing from this influence any change in their form or degree, progress or topography.

17. The precocity of the cerebro-spinal syphilitic affections furnishes no peculiar indication as to the question of treatment. Whatever be the age of the constitutional disease, the manifestations on the nerve-centres require the same specific modification. The circumstance, proper to the affection itself, furnish the indications of secondary importance, relative to the choice, doses, and combinations of the two specific agents.

OVARIOTOMY AT THE RICHMOND SURGICAL HOSPITAL.

We understand that quite recently Mr. Stokes has had a most successful ovariotomy case. At the time of the operation, owing to the numerous firm adhesions that were present, and the extensive incision which had to be made, before the tumour, which was unusually large and mainly solid, could be removed, a different result was anticipated. The patient, we are glad to learn, recovered without a bad symptom, the wound healing without trace of suppuration. The pedicle was ligatured with carbolised silk, kindly given to Mr. Stokes by Professor Lister, and a drainage tube inserted in the wound. Rigid antiseptic precautions were adopted, both during and subsequent to the operation. Of the last six ovariotomy operations performed in the Richmond Hospital there have been five recoveries. This result is, it must be admitted, most encouraging.

MR. MACARTNEY, M.P., AND THE IRISH VACCINATION BILL.

A correspondent calls our attention to a statement in the *Freeman's Journal*, that Mr. Macartney, M.P., opposed actively any increase in the vaccination fee in Ireland, although he must have been aware that the English fee is, in amount, nearly three times greater than the Irish fee, and that money awards are made to successful vacci-

Digitized by Google

nators in England, which are refused to those in Ireland. But, despite Mr. Macartney's opposition the Bill has passed, and it only remains for us to remind the medical men of Tyrone that Mr. Macartney will within a year or two want their votes, as they wanted his in the progress of the Bill, and to suggest that it would be no more than he deserved at their hands if they polled against him with one voice.

THE NUMERICAL EXTENT OF IRISH POOR-LAW MEDICAL RELIEF.

The Irish Local Government Board gives some interesting statistics of medical relief in the various provinces of Ireland in their report which has just been issued.

In Ulster there has been an increase of 6,081 cases at the dispensaries, but a decrease of 630 of those attended at their own houses. In Munster there has been an increase of 5,197 cases at the dispensaries, and of 5,442 of those attended at their own houses. In Leinster there has been an increase of 8,042 cases at the dispensaries, and of 2,964 of those attended at their own houses. In Connaught there has been a decrease of 1,447 cases at the dispensaries, but an increase of 617 of those attended in their own houses.

THE MORTALITY IN DUBLIN.

The deaths registered in the Dublin district during the week ending 9th August, represent an annual mortality of 23·8 in every 1,000 of the population.

In London the death-rate was 17·6 in every 1,000 of the estimated population; in Glasgow, 15·6; and in Edinburgh, 15·2.

The number of new cases of small-pox admitted into the Dublin hospitals during the week was 16, being 11 more than in the preceding week, but 5 less than in the week ending 26th July; 17 patients were discharged during the week, 3 died, and 40 remained under treatment on Saturday last, being 4 under the number in hospital on Saturday, 2nd inst.

Compared with the preceding week there was an increase in the number of new cases of fever and scarlatina admitted into the principal hospitals, but there are not many cases of these diseases under treatment. No cases of measles, and only 3 of pneumonia were received during the week.

Surgeon J. D. Crowe, of the Army Medical Department, recently saved the life of Lieutenant Cathcart, 79th Highlanders. While endeavouring to swim without the aid of his cork belt, Mr. Cathcart went out of his depth and sank twice, when Dr. Crowe plunged into the water with his clothes on, and brought him to the bank. This is the second life saved from drowning by Dr. Crowe.

Notice has been given by the Royal College of Surgeons of England, that applications with a view to lecture under the Erasmus Wilson Trust will be received by the Secretary of the College at any time in the month of October, but none can be received after the end of that month.

INCREASE OF PAUPERISM IN IRELAND.

In their lately-issued Report the Irish Local Government note a serious addition to the pauperism of Ireland within the past two years.

In 1876 and 1877 the Board noticed a decrease in the average daily number of workhouse inmates for two years in succession. In 1878 we were called on to report a change in the other direction; the average daily number of inmates being 1,441 more than in the preceding year, attributable to the indifferent harvest of 1877, and to the inclemency and wetness of the subsequent season. In the present report the average daily number of inmates shows an increase of 3,318 over that of the preceding year.

The out-door relief lists at the same periods show also an increase of 2,727.

The latest returns show in regard to the workhouse inmates a difference of only 2,267 between the present and the past year, at the close of the corresponding week; but, on the other hand, a difference of no less than 4,404 between the numbers on *out-door* relief in 1878 and 1879.

The Board derives a grim satisfaction from these figures, which they conceive prove the "elasticity of the Irish Poor-law system. They say that the excess of the number of recipients of relief in the present year strikingly confirms their repeated observations, that under the existing Irish Poor-law fluctuations in the extent of the relief afforded, are mainly due to the character of the seasons, and this law of fluctuation presents itself systematically, not only as between the different portions of each succeeding year, but likewise between one year and another year, according to its character, as affecting the general health and condition of thepopulation.

They also say that if the exceptional severity of the winter had been attended by no increase in the number of workhouse inmates, and by no increase in the number of persons receiving out-door relief, the Irish Poor-law would have failed to exhibit that elasticity and adaptation of itself to the circumstances of the country which has been for twenty-five years its most striking characteristic; and they express their satisfaction that a year almost unexampled for the length and severity of the winter season has produced so little strain upon the resources of the Poor-law Unions. It is further satisfactory to reflect that the increased cost of out-door relief, viz., £8,188, although forming a large percentage, in addition to the previous year's cost, has been expended on the three following classes exclusively, viz.:—

Persons permanently disabled from labour by reason of old age, infirmity, or bodily or mental defect.

Widows having two or more legitimate children dependent on them.

Persons disabled from labour by reason of severe sickness or serious accident.

Coroners' Verdicts and Inquest Witnesses.—A joiner named M'George died at Liverpool on July 14. The post-mortem indicated apoplexy. The man had eaten some lettuce for his tea the night before; the doctor had probably heard of lettuce-opium, and actually swore that the apoplexy had been induced by the quantity of lettuce, which would be dangerous to an elderly person! The jury found that death had resulted from poison (!) but whether or not it was contained in the lettuce there was not sufficient evidence to show!!!

Digitized by Google

other cause, if the treatment be thoughtfully adapted to the peculiar circumstances of the case, a cure may, as a rule, be hoped for."

With regard to the treatment of ear diseases in general, we observe that Mr. Field displays much judgment, that he gives great attention to the constitutional treatment of the patient, and is in short guided by those sound principles of general pathology and therapeutics which should mould the practice of every specialist.

With regard to the employment of blisters and other forms of counter-irritation, we quite agree with him in attaching much importance to the use of an agent that is too much neglected at the present day. Among other observations on this subject, Mr. Field says: "Two main facts stand out prominently for our guidance as the result of clinical experience, namely, first, the teaching of ages has shown that, when we desire to effect the absorption of effused serum no remedy is so successful as counter-irritation. . . . Nor are these facts in contradiction with the great physiological truth first taught by Hilton, namely, that the blood-vessels of the skin sympathise, by means of their vaso-motor nerves, with those of the organs beneath. For we learn, clinically, that the irritation of a blister on the skin of the thorax produces a similar irritation of the vessels of the pleura, with a change of nutrition in both parts of the same nature, but not to the same degree. . . . In like manner the blister behind the external ear affects the nutrition of the internal ear."

Although we have had good reason to speak well of Mr. Field's work we do not wish to imply that it is faultless. As a guide to the young practitioner in the management of this troublesome and often puzzling class of affections it would have been better had the author put in a clearer light than he has the differential diagnosis of the various diseases to which the organ of hearing is liable. No doubt the number of clinical reports scattered throughout the work partly makes up for this deficiency; but in the next edition of this book, which we think will soon be called for, the insertion of a chapter on diagnosis would be a decided and very useful improvement.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber,', "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

THE EXHIBITION OF SURGICAL INSTRUMENTS, DRUGS, &c.—In consequence of the length to which Mr. Savory's Address extends this week, we are compelled to hold over our report till next week.

MR. IRVIN O'FLYNN.—The appointments are not advertised in France as in this country. In the first place, fluency in the language would be necessary, and you must be on the spot so as to make application as vacancies occur.

A FOREIGN GRADUATE.—We propose devoting space to a consideration of the subject in the issue following our Students' Number next month. Having had several inquiries, we think the report would prove of service.

A PROVINCIAL PRACTITIONER.—Prof. Landolt's "Manual of Examination of the Eyes" will best answer your purpose. It is certainly the most practical work we have examined of late years. An English translation is obtainable at any of the medical booksellers.

MR. WARNER.—Sorry we cannot assist you in your researches, the subject is scarcely within our province.

PROFESSOR BLACKIE.—The following story is told by the *Paisley Herald* as a proof that Scotchmen are not so impervious to a joke as is popularly supposed. "One morning during the last session Professor Blackie, of Edinburgh University, feeling unwell to meet his classes as usual, he sent a messenger to chalk on the black board—'Prof. Blackie will not meet his classes to-day.' A wag among the students thereupon rubbed out the c in the last word but one, leaving the announcement thus: 'Prof. Blackie will not meet his lasses to-day.' Next morning, when the Professor came in, his eye caught the mutilated sentence, and, with a merry twinkle, he went up to the board and deleted the first letter of the penultimate word, the sentence thus reading: 'Prof. Blackie will not meet his asses to-day.' The learned Professor then walked out of the room in triumph, having certainly the best of the wag."

MR. FISHER.—Reviews of works *cannot* be criticised by the authors.

F.R.C.S.—Certainly.

ANALYST.—Write to the Editor of the journal called *The Analyst*, the Editor of which would doubtless help you to elucidate the puzzle.

DR. CHARTERIS'S "PRACTICE OF MEDICINE."—In our review of this book at page 144, last number, there was a slight error in the punctuation which altered our contention somewhat. At line 21 the quotation marks should be placed thus: "Cold effusions in the treatment of *scarlatina anginosa*" still remains, &c.

ARMY MEDICAL SERVICE.—The next examination for admission to this service is deferred until the end of September in consequence of a deficiency of candidates.

DR. ROBERTS will please receive our thanks.

"STATE OF MEDICINE AND PHARMACY IN FRANCE."—Since our notice of this interesting publication in our "Literary Notes," August 6, we have had several letters inquiring where it is to be obtained, price, &c. The work was published a few weeks since at Nantes, the price we do not know, but copies are, we believe, obtainable in London at the principal foreign houses.

COMMUNICATIONS, Enclosures, &c., have been received from—Sir Hy. Thompson, London. Dr. Braxton Hicks, London. Dr. Dobell, London. Prof. McKendrick, Glasgow. Dr. Van der Smaght, Ceylon. Dr. Cassells, Glasgow. Dr. Delstanche, Bruxelles. Prof. Darling, New York. Mr. W. Adams, London. Mr. Bayley, Northampton. Dr. Harbinson, Lancaster. Dr. Tilt, London. Mr. Gant, London. Mr. Atkinson, London. Dr. Charteris, Glasgow. Dr. Langdon Down, Normansfield. Dr. Stretch Dowse, London. Mr. Field, London. Mr. Hay, Hull. Dr. Pearse, Measham. Dr. Pearse, Plymouth. VACANCIES.

Bantry Union, Glengarriff Dispensary.—Medical Officer. Salary, £90, with fees, and £10 as Medical Officer of Health. Election, Aug. 29.

Chelmsford.—Medical Officer of Health. Salary, £60 per annum. Appointment for three years. Applications to W. W. Duffield, 96 High Street, Chelmsford, by Aug. 23.

East London Hospital for Children.—Resident Clinical Assistant. Board, but no salary. Applications to the Secretary on or before Sept. 8. (See Advt.)

Hampstead, Parish of St. John.—Medical Officer of Health. Salary, £125. Applications to the Vestry Clerk endorsed "Medical Officer of Health," before Sept. 1.

London Fever Hospital.—Resident Medical Officer. Salary, £200. Applications to the Secretary, Liverpool Road, Islington, before Sept. 6.

Mullingar Union, Castletown, Geoghegan Dispensary.—Medical Officer. Salary, £120, with fees and Sanitary salary. Election, Aug. 26.

Nottingham General Hospital.—House Surgeon. Salary, £80, with board, &c. Applications to the Secretary before Sept. 1.

Queen Charlotte's Lying-in Hospital.—Resident Medical Officer. Salary, £60, with board. Applications to the Secretary 191 Marylebone Road, London, W., on or before Sept. 1.

Ramsgate Seaman's Infirmary.—Resident Medical Officer. Salary, £130. Applications to the Secretary on or before Aug. 30

Shillelagh Union, Hacketstown Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Officer of Health. Election, Sept. 1.

Westminster Hospital.—Pathologist and Curator of Museum. Salary, £52. Applications to the Secretary on or before Sept. 13.

APPOINTMENTS.

BLAMEY, J., M.R.C.S.E., a House Surgeon to the West London Hospital.

BULLOCK, C., L.R.C.P.L., M.R.C.S.E., House Surgeon to the Windsor Royal Infirmary.

CLARK, Miss A., M.D., L.K.Q.C.P.I., Assistant House Surgeon and Registrar to the Children's Hospital, Birmingham.

LEE, J. H., L.A.H.D., Resident Medical Officer to the Limerick County Infirmary.

LUNN, J. R., L.R.C.P.L., M.R.C.S.E., Resident Clinical Assistant to the East London Hospital for Children, Shadwell.

MCMUNN, J., L.R.C.S.I., Resident Medical Officer to the Great Northern Hospital, London.

MORGAN, J. H., F.R.C.S.E., an Assistant Surgeon to the West London Hospital.

NEWMAN, J. J., L.R.C.P.L., M.R.C.S.E., House Surgeon to the Croydon General Hospital.

O'SHAUGHNESSY, P. J. B., L.R.C.S.I., Medical Officer to the Kanturk Union Workhouse

ROBINSON, G. W., L.R.C.P.L., M.R.C.S.E., House Surgeon to the Royal Portsmouth, Portsea, and Gosport Hospital.

SMITH, W. B., L.R.C.P.Ed., F.R.C.S.Ed., an Honorary Medical Officer to the Stockton Hospital.

VIVIAN, R. T., M.R.C.S.E., House Surgeon to the Male and Out-patient Department of the London Lock Hospital.

WOOD, F. H., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer of Health for the Wakefield Rural Sanitary District.

Births.

ARMSTRONG.—On Aug. 12, at 10 Brighton Vale, Monkstown, the wife of G. R. Armstrong, M.R.C.S.E., of a daughter.

GRAVES.—On Aug. 6, at Clonskeagh, co. Dublin, the wife of Surgeon-Major W. Graves, A.M.D., of twins—a son and daughter.

MELDON.—On Aug. 13, at 15 Merrion Square North, Dublin, the wife of Austin Meldon, F.R.C.S.I., of a son.

TINDALL.—On Aug. 15, at Rydal Villa, St. John's, S.E., the wife of Albert Alfred Tindall (MEDICAL PRESS), of a daughter.

Marriages.

FITZSIMONS—JEFFARES.—On Aug. 13, at Kilscoran Church, co. Wexford, J. B. Fitzsimons, M.D., L.R.C.S.I., to Orinda Annie, eldest daughter of W. S. Jeffares, Esq., Kilkenny.

KNOX-SANDELS.—On Aug. 6, at Lismaskea, co. Fermanagh, Thomas Knox, L.R.C.S.I., Maguiresbridge, co. Fermanagh, to Louie, only daughter of W. J. Sandels, M.R.C.S.E.

Deaths.

BURKE.—On Aug. 13, at 88 Stephen's Green, Dublin, Wm. M. Burke, M.R.C.S.E., Registrar-General, aged 60.

BLYTH.—On Aug. 6, at Narrandera, New South Wales, Howard Blyth, M.B., aged 24.

HARTLEY.—On Aug. 11, at 3 Bar Houses, Beverley, John Hartley, M.D., aged 63.

KITCHENER.—On Aug. 13, at Bath, Marie Louise, wife of T. Kitchener, M.D.

MAUND.—On Aug. 11, at Westmount, Sandown, Isle of Wight, Henry Maund, M.D., aged 51.

SCATCHARD.—On Aug. 6, at Boston Spa, near Tadcaster, Yorkshire, Thomas Scatchard, M.R.C.S.E.

STANTON.—On Aug. 12, at 9 Montague Square, London, W., John Stanton, M.D., aged 68.

THOMASON.—On Aug. 9, suddenly, at Panama, on board H.M.S. *Osprey*, Dr. W. J. Thomason, Staff-Surgeon R.N., aged 39. (*By Telegraph*).

TREVOR.—On June 28, at San Antonio, Peru, S. Lloyd Trevor, M.R.C.S., of Welshpool.

WOOLDRIDGE.—On Aug. 13, at Withdean, Brighton, Edward Wooldridge, M.D., aged 62.

YOUNG.—On Aug. 12, at Wrington, Somerset, William H. Young, M.D., aged 92.

LAENNEC: HIS LABOURS AND THEIR INFLUENCE IN MEDICINE. (a)

By ALFRED HUDSON, M.D., F.K.Q.C.P., M.R.I.A.,
Regius Professor of Physic in the University of Dublin.

To attempt a review of the triumphs of the present and recent past would be to follow, by unequal steps, in the path of those who have so ably and exhaustively treated the subject on many previous occasions, and to repeat to-day what you have read in the retrospects, records, and journals of yesterday; while to portray the glories of the future of medicine would require a prescience which I do not possess; besides, having arrived at an age when a man naturally becomes a *laudator temporis acti*, I felt attracted to the consideration of the more remote past, and I resolved to offer a few observations on the history of its several epochs, and of their representative men, and more especially of the great revolution which was in progress in my student days, when the era of nosology was superseded by that of pathology; when the theoretical deductions of Cullen and his predecessors were replaced by the inductive method of the present day, as inaugurated by Laennec.

In a comprehensive review of the past, three things attract our attention: its history, its progress, and the lives of the men who have marked its successive epochs.

Such a task differs from that of the student, or of the worker of the present day, in that, while the one necessarily seeks for advanced knowledge in the most recent sources, and the other founds his conceptions on those of his more immediate predecessors, a retrospect of the kind involves some notice of men whose works are now obsolete, and whose names have become mere traditions in the history of the science.

Its history has not always been one of progress, but rather a record of barren hypothesis and fanciful systems; of the lives and labours of men, often of marvellous ability and industry, whose aim was to attain that which was unattainable:

"Crying for the light,
And with no language but a cry."

These men have been sometimes compared to giants, who, taking us in their arms, and lifting us above their heads, have disclosed to us countries and prospects which they themselves could never discover. Living before their age, and being unable to explain observed phenomena by the aid of the imperfect science of the time, they resorted to hypotheses evolved out of their own consciousness, which were really not explanatory of diseased processes, while their ideas of therapeutics were made to correspond with these imaginary conditions. Not that their labours were altogether useless, for, as has been well said: "As in the growth and development of the body the daily death of the tissues is in strict relation with the activity of life, so in the organic growth of thought through the ages there is a corresponding decay or consumption of erroneous doctrines—a death of the false in strict relation with the growth of the true."

The comparison of the growth and development of science to that of the human body is by no means a novel one, and it is employed by Lord Bacon in terms peculiarly applicable to clinical medicine: "As young men," says Bacon, "when they knit in shape and perfectly, do seldom grow to a further stature, so knowledge, while it is in aphorisms and observations, is in growth; but when once it is comprehended in exact methods, it may, perchance, be further polished and illustrated, and accommodated for use and practice, but it increaseth no more in bulk and substance." The different stages of this comparison of progress correspond with the lives and labours of the great men who have marked the successive epochs of the science. While those of Harvey and of Haller are associated with the birth and progress of physiology, and Hunter is commemorated periodically as the founder of scientific surgery, the great names of Hippocrates, Morgagni, and Laennec correspond to the eras of aphorism, observation, and method, which each of them in turn illustrated by his life and works—each life, moreover, affording practical lessons of value. Thus the life of Hippocrates teaches the value of that early acquaintance with the objects of his future, study now too much overlooked. We are told that, "amid the sports of childhood he received from the mouths of his parents the elementary notions of medical science. By viewing diseases he learnt to distinguish them." Himself convinced of the superiority of this method of practical instruction, Hippocrates wrote: "In order to improve to a certain degree the knowledge and practical skill of the physician, it is necessary (independent of natural genius, the place of which nothing indeed can supply) that he be placed from early infancy amid all the objects of his researches, and that every

(a) Abstract of the Address in Medicine delivered at the Annual Meeting of the British Medical Association in Cork, August, 1879.

Digitized by Google

means of instruction be employed with unremitting assiduity." (*a*)

Of the character of his writings, Cabanis remarks: "He brought the science back again to its natural channel, that of rational experience. He freed medicine from false theories, and formed for it sure and solid systems. His books of aphorisms have in all ages been regarded as models of grandeur of conception and precision of style. Through the whole of them we may remark that truly universal method, the only one which is adapted to the mode in which our intellectual faculties are exercised, and which, in every art and in every science, by making the principles flow naturally from the observations that have been collected, transforms the deductions from facts into general rules." This writer adds—"If the disciples of Hippocrates had understood his lessons well, they might have laid the foundation of that analytical philosophy by the aid of which the human mind will be henceforth enabled to create to itself, as it were daily, some new and improved instruments of advancement." It is scarcely necessary to remark how exactly this prediction has been realised in the history of physical diagnosis and in the life of Laennec.

The traditions of Hippocrates and his natural method, having outlived the centuries of dogmatism and of successive systems, have survived to the present day, transmitted through the dark ages of medicine in the aphorisms of Lommius, Baglivi, Boerhaave, Stoll, and others—aphorisms which, while comparatively free from the dogmatism of the age, contain matter of the highest practical value. One of the most illustrious of these writers (Baglivi) devotes two chapters to treating of the hindrances (*impedimenta*) of progress arising from neglect of ancient aphorisms and observations, and love of new systems, maintaining that "the entire value of the history of diseases depends on the careful and patient description of that which the observer, skilled in the mode of invasion, the progress, and issue of diseases, has perceived." The writings of these men, like those of their great master, are especially distinguished by the fidelity of their descriptions of symptoms and the sagacity with which they anticipated sequences. They read the prognostic signs of disease with an accuracy and an insight whose

"—Old experience doth attain
To something like prophetic strain,"

and are for these reasons, if for no other, worthy of the careful study of the practitioner. By the side of these names we place that of the English Hippocrates, Sydenham, the great observer, who, says the editor of his works, now stands out, at nearly the end of a second century, as the great representative of the practical medicine of practical England.

The influence of Sydenham is especially seen in the writings of the succeeding century, of Grant and Huxham, of Pringle, and others whom a distinguished American writer on fever terms "those glorious old British observers—the types and ornaments of a school never since surpassed by their countrymen." And I may here remark that the study of these and the above-mentioned older writers would greatly tend to moderate extravagance of doctrine and exclusive devotion to special methods of treatment in our own day. These British writers, as Dr. Bartlett observes, clearly recognised the distinction between the two great forms of continued fever, which the great majority of the British physicians in his day "refused to admit or to endeavour to ascertain;" while, of the wisdom and breadth of their views of treatment, no higher testimony need be adduced than the candid acknowledgment of Dr. Stokes, who says in his memoir on the state of the heart and use of wine in typhus fever—"I confess that it was not until several years after I commenced practice that I became fully aware of the erroneousness of what is termed the anatomical theory of disease; and I feel certain, humiliating though the confession may be, that the fear of stimulants with which I was imbued was the means of my losing many patients, whose lives would have been saved had I trusted less to the doctrine of inflammation and more to the lessons of experience given to us by men who observed and wrote before the times of Bichat or Hunter."

I would add one remark to the above. It is, that a careful perusal of the excellent, albeit, somewhat antiquated, chapter of Lommius on the diet of a fever patient, might help to guard the young practitioner from the too prevalent perversion and abuse of Graves's famous saying, "He fed fevers."

In England, these great observers were succeeded by others scarcely less noteworthy; by Fothergill and Fordyce, Heberden and Currie, whose writings will live as long as the art is cultivated.

Contemporary with these men were others; men of great ability, but who aimed at generalisations rather than observation, and strove to construct systems to which the medicine of the future should conform. I need not tell you that the systems of Cullen, of Brown, and of Darwin, have long become things of the past and forgotten.

But we pass on to the epoch of Pathology and Clinical Medicine inaugurated by Morgagni and his contemporaries and successors. In an admirable address delivered before the Glasgow Pathological and Clinical Society in 1864, Professor Gairdner thus tersely describes the character of Morgagni's work.

"In investigating the *seats* of diseases, Morgagni is not content to record the *coincidence* of a lesion in an organ with the symptoms apparently due to disordered function in that organ.

"For the first time almost in the history of medical inquiry, he insists on examining every organ, as well as the one suspected to be chiefly implicated; not only so, he marshals with the utmost care from his own experience and that of his predecessors, all the instances in which the symptoms have existed apart from the lesion, or the lesion apart from the symptoms. He discusses each of these instances with severe exactness in the interest of truth, and only after an exhaustive investigation will he allow the inference either that the organ referred to is, or is not, the seat of the disease.

"And in like manner in dealing with causes; a group of symptoms *may* be caused by certain organic changes—it may be even probable that it is so—but, according to Morgagni's method, we must first inquire into *all* the lesions of organs which occur in connection with such symptoms; in the second place, we must know if such lesions ever occur, or occur without the symptoms; and again, if such symptoms can be attributed in any cases to other causes in the absence of such lesion."

Did time permit, I would fain add to Dr. Gairdner's illustrations some examples of the glimpses of facts pointing to future observations and discoveries which are scattered through the portion of Morgagni's work relating to thoracic diseases. Such are his remarks on the connection between disordered states of the nervous system and deranged respiration (Letter 15); his notice of the sound heard on applying the ear to the præcordial region in a case of pericardial effusion (Letter 16); of the decubitus in empyema and the displacement of the liver in that disease; of the signs of dilatation of the right ventricle, and the clear explanation of the phenomenon of jugular pulsation, and the wonder he expresses that the increased bulk of the heart is not attended to in the histories of asthma; and of the curious case (quoted by Wardrop in his work on the heart) of alteration in the radial pulse, caused by a fall on the spine, and inexplicable until the discovery of the vaso-motor system of nerves; to lesions of which similar cases have been referred by Dr. Russell Reynolds and Dr. J. W. Ogle.

To those who, like Dr. Gairdner, look to what Morgagni has done for pathology and clinical medicine "in the light not only of his own researches, but of those of his successors," it would seem difficult to over-estimate the value of his work and influence. But that the work itself was regarded by his more immediate successors rather as a record of symptoms and morbid appearances than an exposition of morbid processes in the living body, as wanting the explanatory why, and consequently of little assistance to the practitioner at the bedside, appears from the language of Corvisart, who, after stating that it will immortalise its author, adds the remark that this great work "neither helped nor hastened the art of diagnosis;" adding, in a footnote, that "he himself had formerly read a memoir to the Institute, expressing the idea of a work analogous, but in an inverse sense from that of Morgagni, with the title, "De sedibus et causis morborum per signa diagnostica, investigatis, et per anatomen confirmatis;" but that, for such a work, at least another Morgagni would be required. (*a*)

(*a*) It is worthy of remark that in the course of a discussion on he subject of education in the General Medical Council, in 1877, Sir James Paget stated as the result of his own experience, that everything is in favour of putting a student at once to the daily honest practice of his profession by apprenticeship in the country for the first year.

(*a*) "Dans un des memoires que j'ai lus anciennement à l'Institut j'avais émis l'dée d'un ouvrage analogue mais en sens

Digitized by Google

The hour and the man were both at hand; and, as it has been said of Harvey, "that on the doctrine of the circulation the dawn had long been visible," and when Harvey came the sun arose; "so Laennec appeared, and realised the prevision of Corvisart by substituting a living for a dead pathology, and revolutionising clinical medicine by a method of diagnosis which, by revealing the seat, nature, and *progress* of disease at the bedside, anticipated the disclosures of the post-mortem theatre, and endued the dry and unexplained facts of both symptoms and morbid appearances with meaning and with power."

"Time," says Dr. Stokes, "has shown that the introduction of auscultation and its subsidiary physical signs has been one of the greatest boons ever conferred by the genius of man on the world.

"A new era in medicine has been marked by a new science, depending on the immutable laws of physical phenomena, and like the discoveries founded on such a basis, simple in its application and easily understood—a gift of science to a favoured son; one by which the ear is converted into the eye, the hidden recesses of visceral disease opened to view; a new guide to the treatment, and a new help to the early detection, prevention, and cure, of the most widely spread diseases which affect mankind."

I have alluded to men who lived before their time, who were in advance of their age; Laennec was fortunate in living at the exact period at which he did, when Bichat had just created the science of general anatomy, and Haller and Hunter that of physiology; when Morgagni had grouped such a mass of his own observations and those of others on the results of disease as to entitle him to be called the founder of morbid anatomy; and when the first essay in physical diagnosis by Auenbrugger, long neglected, had been taken up and translated by Corvisart, who employed percussion as an aid to the diagnosis of cardiac diseases with much success. Laennec had thus, in the works of his immediate predecessors, the materials necessary for his system, which needed only the spark of his genius to burst into life and beauty.

I cannot but think it also fortunate that he did not live at a later period. He might perhaps have then anticipated some of the improvements which have followed from the modern advances in the correlated sciences; but I can imagine that, had the pathological anatomy of the period ripened into the histology of the present day—a science which, says Dr. Gairdner, "can only be sounded through the absolute devotion of a lifetime to its new methods of research"—his active and inquiring mind might have been altogether diverted from the study of the diagnosis of disease at the bedside to the researches of the dead-room and the laboratory, which, however important, must be held to be subordinate and secondary to the other. Laennec would seem to have so regarded it, when he wrote that "if the causes of severe diseases are sought for in mere microscopical alterations of structure, it is impossible to avoid running into consequences the most absurd; and if once cultivated in this spirit, pathological anatomy, as well as that of the body in a sound state, will soon fall from the rank which it holds among the physical sciences, and become a mere tissue of hypotheses, founded in optical illusions and fanciful speculations without any real benefit to medicine."

The life of Laennec, like the lives of other illustrious men, is not without its lessons. Although of feeble constitution and delicate health, it was marked by mental activity and incessant work. Like his great prototype Hippocrates, he became early familiar with disease, and while a youth, showed a decided predilection for morbid anatomy and clinical observation, the future studies of his life. At the early age of eighteen, he served as assistant-surgeon in the military hospitals, and in the following year he became a pupil of Corvisart at La Charité. Here he proved his diligence in the study of clinical medicine by drawing up a minute history of nearly four hundred cases of disease, which, it is known, furnished the groundwork of all his future researches and discoveries.

On taking his degree, he wrote a thesis on the doctrine of Hippocrates, as applied to practical medicine, which, says M. Bayle, proved him to be no less skilled in the knowledge of the Greek language than deeply read in the writings of the father of physic. In the previous year, he had commenced a course of lectures on pathological anatomy, which he continued for three years, when ill-health obliged him to discontinue them. From this time until 1816, he continued to contribute articles on general and morbid anatomy to the *Dictionary of Medical Sciences*, and other publications; but on his appointment as physician to the Necker Hospital they ceased, and having made the discovery of mediate auscultation, he devoted himself solely to the perfecting of the new system of diagnosis which he founded on it, and to the clinical teaching of his method to the numerous students who resorted to him.

The history of this discovery is well known, but Laennec's observations on it are too important to be passed over without notice. "From this moment," says he, "I imagined that the circumstance might furnish means for enabling us to ascertain the character, not only of the action of the heart, but of every species of sound produced by the motion of the thoracic viscera, and, consequently, for the exploration of the respiration, the voice, the rattle or rhonchus, and perhaps even the fluctuation of fluid extravasated in the pleura or pericardium. With this conviction, I forthwith commenced at the Hospital Necker a series of observations, which have been continued to the present time. The consequence is, that I have been enabled to discover a set of new signs of diseases of the chest, for the most part certain, simple, and prominent, and calculated, perhaps, to render the diagnosis of the diseases of the lungs, heart, and pleura as decided and circumstantial as the indications furnished to the surgeon by the introduction of the finger, or sound, in the complaints where these are used."

I have quoted this passage at length, as showing the strictly inductive character of the process of this discovery: first the observed fact, followed immediately by the anticipation based on previous knowledge of the pathological conditions of other diseases; then the repeated experimental trials, and the confirmation of the anticipation by repeated post-mortem examinations.

The narrative illustrates several important principles common to the histories of scientific discovery.

First, it was apparently, but only apparently, accidental. "Men," says Whewell, "are fond of repeating that such discoveries are most commonly the result of accident; and we have seen reason to regret this opinion, since that preparation of thought by which the accident produces the discovery is the most important of the conditions on which the successful result depends." Then, it conformed to the usual conditions, viz., distinct general notions, careful observation of many facts, and the mental act of bringing together these elements of truth.

Regarded as an epoch in scientific discovery, this, like other inductive epochs, had a prelude in the preceding period, which led immediately up to it, and to which I have already referred. It has also had a sequel of verification and connection during which the discovery has acquired a more perfect certainty and a more complete development among the more advanced thinkers and improvers, has been diffused to the wider throng of the secondary cultivators, and traced into its distant consequences in its influence on the practice and teaching of medicine and on the status of the profession.

This discovery, nevertheless, did not at first excite much interest in the profession generally. In was announced in the *Edinburgh Medical Journal* of the day in these terms: "M. Laennec has discovered that, by interposing a tube of paper or wood between the ear of the observer and the chest of the patient, much information may be acquired concerning the diseases of the chest. The pulsations of the heart are thus rendered more audible, and in phthisical patients the voice seems to proceed from the chest when one end of the tube is placed over those places where there are tubercles, and, according as the sound is clear or rattling, we may judge whether the cavity is clear or contains pus."

After such a notice, it is not surprising that the practitioners of the day did not much concern themselves about the new method of diagnosis, or that Sir John Forbes should write, three years after the appearance of his translation, that up to that time not even a single case of the use of auscultation had appeared in any British medical journal. Some of us can remember how the stethoscope and its inventor were sneered at and ridiculed by a few of the teachers of our own day. The new light was too strong for older eyes; and it is possible that, had not Laennec survived his discovery for some years and continued to demonstrate its employment and results to the younger generation, it might have left as slight an im-

inverse pourtant á celui de Morgagni; il aurait en pour titre, *De sedibus et causis morborum per signa diagnostica investigatis et per anatomen confirmatis.* Mais pour un tel ouvrage il foudrait au moins un autre Morgagni." (*Sur les Maladies du Cœur. Discours préliminaire*, p. ix.)

Digitized by Google

pression on the minds of the profession as had the treatise on percussion by Auenbrugger, which preceded it.

Sir James Paget tells us that, "although Hunter was in high repute as the chief anatomist and naturalist of the time, yet in his great work of comparative anatomy and physiology not one of the young men of science imitated him—in the highest sciences he had not one true disciple." With Laennec it was different: unlike Hunter, he was "apt to teach," and had the opportunity afforded by his connection with the Hospital Necker of training numerous disciples from this and other countries, one of the most distiguished of whom (Dr. Williams) still survives. Others who, like our own Stokes and Corrigan, had not the advantage of his personal teaching, drank the knowledge from his published writings, and drew therefrom an inspiration and an impulse which carried them far into the field of discovery.

It only remains to remark that from Laennec's first observation till his death only ten years elapsed, two years of which were spent in the country, while suffering from disease which afterwards proved fatal. Few men have contributed an equal amount of such valuable work within the same space of time. Of its appreciation by men of kindred genius and pursuits, I have already given one example in the eloquent words of Dr. Stokes; let me add another in those of Dr. Addison. "Were," says Dr. Addison, "I to affirm that Laennec contributed more towards the advancement of the medical art than any other single individual, either of ancient or of modern times, I should probably be advancing a proposition which, in the estimation of many, is neither extravagant nor unjust. His work *De l'Auscultation Médiate* will ever remain a monument of genius, industry, modesty, and truth. It is a work, in perusing which every succeeding page only tends to increase our admiration of the man, to captivate our attention, and to command our confidence. We are led insensibly to the bedside of his patients; we are startled by the originality of his system; we can hardly persuade ourselves that any means so simple can accomplish so much, can overcome and reduce to order the chaotic confusion of thoracic pathology; and hesitate not in the end to acknowledge our unqualified wonder at the triumphant confirmation of all he professed to accomplish." But is he still appreciated as he deserved? Is he still the living oracle, or rather is not his name now rarely mentioned—fast becoming a mere tradition among practitioners and students? His work has been long out of print in both languages, but neither the old nor the new Sydenham Societies have thought it worthy of a re-issue. For the one it may have been too new—not yet fossilised; and it may be supposed that the council of the new society have passed it by while translating and re-editing works of inferior merit, because it is too old. I am glad, however, to see an announcement in a recent number of the *Lancet* that, "Thanks to the late Minister of Public Instruction, who granted a subsidy for this purpose, the Faculty of Medicine have been enabled to publish a new edition of Laennec's work upon auscultation, which has long been out of print. This is intended as a national monument to the illustrious pioneer in physical diagnosis; and it is to be sold at a low price, in order to bring it within the reach of all." The old saying seems still to be true: "They manage these things better in France."

What has been Laennec's influence on practice, on clinical teaching, and on the public estimate of medicine? By his introduction of differential diagnosis—the essential pre-requisite of scientific therapeutics—the treatment of diseases of the chest, previously directed to a name, a group of symptoms, or often to a single symptom supposed to be pathognomonic of a certain affection, has become differentiated; and a case of pneumonia is no longer treated as one of pleuritis, nor one of diseased heart; or of emphysema as one of hydrothorax—the universal practice during the preceding era. Auscultation, also, by enabling us to recognise the tendency of diseases to recovery, or the contrary, becomes a powerful adjuvant in their treatment. Moreover, we have, in the recognition of the vital condition and innervation of the heart, a most valuable guide to the treatment of various diseases, notably with regard to the exhibition of wine in fever, and the treatment of the cerebral anæmia of fatty heart and of other cerebral affections; and, in the field of preventive medicine, auscultation co-operates by detecting the germs and vestiges of disease, as the early signs of phthisis or the organic sequelæ of acute disease.

With regard to Laennec's influence on clinical instruction, we might well ask what would such instruction be, if physical diagnosis were omitted? Without it, the knowledge gained at the bedside would be mere cramming. "*Teaching*," says Dr. Moxon, "is the storing of knowledge—it may be done quickly. *Training* is the creation of an organ for the use of knowledge—it needs much time, it is a slow processs. The trainer has to convert the pupil's knowledge into motive, his desire into patience, his will into skill. Every good trainer aims to raise upi[illegible] pupil's mind *a self-training faculty*, which shall itself continue to train, more and more knowledge into motive. By such training knowledge becomes power." This is exactly what physical diagnosis does. Following the method of Laennec, the clinical teacher trains the pupil to the use of his senses in the observation of sensible phenomena, then to the associating these with the physical conditions from which they arise, and finally to their relations with principles of pathology and of treatment. No greater improvement has ever been effected in medical education than by the introduction of this method into hospital teaching by the late Dr. Graves, as described in his work on clinical medicine.

It were more easy to say what should be than what is the influence—indirect, of course—of Laennec on the public estimate of medicine. This, we know, has never been high; and physicians have been the objects of satire for centuries. A hundred years ago, Zimmerman wrote: "I sometimes hear pretended wits affecting, with a tone of raillery, that physic is still such as it was in the time of Hippocrates, and that the best informed physicians know only that which he knew. Later, we have the question gravely propounded by Sir William Hamilton: "Has the practice of medicine made a single step since Hippocrates?" and the late Dr. Symonds, in a Presidential Address on this subject—since published in his *Miscellanies*—referred to passages in two leading reviews of the day, too long for quotation, both representing medicine as uncertain, always changing, resting on arbitrary assumption, &c. One oracle asks: "But can any one at this moment seriously declare that there is such a thing as a science of medicine?" "What there is is this: there are a few facts—a very few—distinctly known and beyond the reach of controversy, and the number of these increases but slowly if it sensibly increases at all.

Our answer to such nonsense is to point to what Laennec has done. Is the influence of medicine in directly saving life called in question, we may refer to the physical diagnosis of cases which, without medical or surgical interference, run on inevitably to a fatal termination: *e.g.*, of empyema, or of a foreign body in the bronchus; to the advantage of the early detection and treatment of phthisis, or certain diseases of the heart, or aneurism of the aorta.

In regard of that power of prognosis which Hippocrates recommended physicians to cultivate, with a view to securing the confidence of those who consulted them, I need not remind you of what we owe to Laennec; and in the detection of latent disease, in the numerous cases in which the aid of the physician is sought by insurance companies or Governmental departments, from whom do we obtain help so largely as from Laennec, either alone or in conjunction with Bright? If, then, we challenge the public estimate for our profession as a science, it is to Laennec we owe much of the grounds of our claim; and if it be said that the art is conjectural, to a portion, at least, we say he has contributed a degree of certainty almost amounting to law.

"As soon as any department of knowledge," says Mr. Buckle, "has been generalised into laws, it contains, either in itself or its applications, three distinct branches: namely, inventions, discoveries, and methods."

Laennec combined all these. His invention was as perfect as simple, tried by the test for such—"will it work?" His discoveries have led to others, only second in importance to his own, by those who have adopted his method. He was not a generaliser like Cullen, and perhaps scarcely deserves the eulogy of Sir William Hamilton on that great man, whom he seems to praise for that "he had not made the discovery of a single phenomenon." He did not undervalue theory, which he calls the "scaffolding of science;" he reasoned—not downwards from general principles to facts, but in the contrary direction; and having seen and seized on the "enlightening fact," and pursued what Bacon calls the "*experimenta lucifera*" through a lengthened series of observations on the living and on the dead, he developed and has bequeathed to us a method "comprehensive and exact" in its induction, which, however, it

Digitized by Google

may hereafter "be further polished and illustrated, and accommodated for use and practice," can never be dispensed with in the present, or superseded in a future age of medicine. To him we may fitly apply Cowley's well-known lines on Bacon:

"From these and all long errors of the way
In which our wandering predecessors went,
And, like the old Hebrews, many years did stray
In deserts but of small extent;
Bacon, like Moses, led us forth at last;
The barren wilderness he past,
Did on the very border stand
Of the blest promised land,
And from the mountain top of his exalted wit
Saw it himself, and showed us it."

Allow me to trespass on your patience for a moment longer, while I express my personal regret for one whose recent death, I may truly say, is deplored by the entire profession; and whose loss to the Association may be judged of by this, that his last public act, so far as I am aware, was in reference to the arrangements for the present meeting.

On reading the short biography, accompanying the announcement of his death, in the *British Medical Journal*, I was struck by the resemblance of his career to that which I have feebly attempted to sketch.

Like Laennec, Dr. Murchison was a diligent and highly distinguished student; he, also, early devoted himself to the cultivation of pathology and clinical medicine, and became a great clinical teacher; like Laennec, he compressed the labours of a long life into a comparatively short period; and like him, his name will ever be associated with a great work—a work which must live, inasmuch as it is not only the most comprehensive and exhaustive which has ever appeared on the subject, but also marks the epoch of that sound and scientific classification of fevers which the late Dr. Parkes, in his admirable address in 1873, pronounced to be probably "our greatest advance in practical medicine." That advance, mainly due to the researches of Stewart and Jenner, has been secured, and rendered permanent, and illustrated by the great work of Charles Murchison.

THE PREVENTION AND TREATMENT OF HÆMORRHAGE AFTER CHILD-BIRTH. (a)

By Dr. T. MORE MADDEN,
Obstetric Physician to the Mater Misericordiæ Hospital, Dublin.

The author remarked that notwithstanding all that had been written on the subject, its further consideration was not unnecessary as long as women still died from hæmorrhage after child-birth, despite all treatment. In the course of a long and tolerably large experience he had witnessed this lamentable accident on only two occasions, once in hospital, the other in private practice. With the gradual advancement of the obstetric art this occurence had become less and less frequent, and in the more perfect midwifery practice of the future it would probably be entirely unknown. It was therefore the duty of all who had opportunities of trying the different methods of preventing or arresting *post partum* hæmorrhage to record their experience, whether successful or unsuccessful, so that others might avoid their failures and imitate their successes. With that view, although novelty was probably impossible in a subject already so thoroughly discussed, he would venture to lay before them the methods which he had employed for the prevention and treatment of hæmorrhage. In his opinion, flooding in the majority of cases was preventible, and under proper treatment before and during labour should be rarely met with. The various predisposing causes of hæmorrhage, and the preventive treatment required by each, were then considered by the author. He also referred to the ill effects of premature delivery by the long forceps before the full dilatation of the *os uteri*, and also the production of hæmorrhage from undue delay in affording instrumental assistance when required in the second stage. The preventive measures he relied on during labour, were early rupture of membranes, in the first stage; enemas of the strong infusion of ergot, or hypodermic injection of ergotine, in the second stage; and firm manual pressure over the uterus until the completion of the third stage and permanent contraction of the uterus is secured. In nineteen instances of severe flooding perchloride of iron was resorted to. In eighteen of these cases the hæmorrhage was arrested; in one it failed. Dr. More Madden did not approve of the employment of this styptic in the ordinary way, by the syringe passed up to the *fundus uteri*, as he considered that a hazardous plan of treatment. He recommended, instead, the application of strong *liquor ferri* by saturated sponge carried by hand into the womb, and applied to the bleeding surface until firm and permanent contraction is obtained. Some cases were referred to in which he thus succeeded in arresting flooding which had resisted all other treatment; and one of these, a case rarely recovered from, namely, rupture of uterus, where he was called in consultation. He therefore regarded his plan as a most effectual method of arresting flooding, but at the same time he admitted that it was not free from danger, or to be adopted without grave necessity. The author's experience of various other remedies employed in checking *post partum hæmorrhage*, immediate and secondary, was then narrated, including the use and abuse of opium, the hypodermic administration of ergotine, the use of galvanism, the use of cold injections, and also of hot syringing in certain cases, and the comparative advantages of the hypodermic injection of ether and the transfusion of blood in cases of extreme exhaustion and collapse from flooding. No circumstance could occur in medical or surgical practice calling more imperatively for the exercise of the highest qualities of the medical attendant, than those in which the obstetric practitioner is placed when called, on it may be suddenly, in a remote district and under unfavourable circumstances, to treat a case of violent flooding, nor in any could the power of the physician's art be more strikingly illustrated than when he was thus enabled to rescue from the tomb one who stands trembling on its brink—pale, pulseless, unconscious, and collapsed from hæmorrhage after labour.

Original Communications.

GEOGRAPHY OF DEVONSHIRE AND CONSUMPTION. (a)

By WILLIAM H. PEARSE, M.D.,
Physician to the Plymouth Public Dispensary.

The following table contains the total deaths—male and female—from phthisis, in 221 parishes in Devon, for the ten years, 1861-70; being for the same years as the tables of death-rate for England and Wales, in the 35th Report of the Registrar-General.

The deaths in the various districts have been grouped into geological areas, and been made comparable with the mean population, density per acre, and approximatively to elevation above sea-level, and to rain-fall.

The table is arranged beginning with the areas having least death-rate, and ending with those having the highest.

The rain-fall is taken from the tables of Mr. Pengelly, F.R.S. The parish returns of deaths are supplied by the Superintendent-Registrars of the districts.

It is believed that the areas, population, and period of ten years, embraced in the table, are sufficiently large as a basis for comparison.

The mean death-rate in *England and Wales* from

* Excluding prisons.
† Excluding Ilfracombe.
‡ Nos. 7, 8, 9, are different geological areas of Plympton.
§ Torquay.

The result of the table is, that the two wildest moorland regions of the county have the least death-rate—Western Dartmoor, 0·36 ; Exmoor, 0·45 ; against England and Wales, 2·47.

Western Dartmoor, or the granite, is essentially wild moorland ; the eastern region of the granite, with higher death-rate, is more cultivated. Again, the North Devon Exmoor (0·45) is open and exposed. It seems just to say that the freedom from phthisis in these regions goes along with, or is due to, the more habitually exposed out-of-door life led by the inhabitants.

Among the physical conditions involved are—pure air ; comparative mountain air (that is, air having, to air at the surface, "more carbonic acid and less oxygen, with little or no organic matter,"—Dr. Angus Smith) ; great rain-fall ; soil and natural drainage ; excess of ozone ; relative electrical conditions and phenomena ; sun "energy," or "forces ;" light, &c. ; in fact, the entirety of the physical conditions (known, and yet more unknown) in and of the atmosphere—using the word "atmosphere" in its widest and fullest sense.

We see the result of the power of such full physical correlations to man's body, in his more fully maintained vito-physical being ; that nerve segment, or "limb," of the body, of which the lungs are part, obtains such vital "force," or "energy," that its natural period of life is sustained, in harmony of time, to the longevity of the other segments, or "limbs," or tissues, of the body generally. In other words, the so far ultimate cells of the lung tissue are not (as they are in tubercular consumption) "early checked in their development . . . and do not early succumb to a process of shrivelling"—(Virchow).

Consumption is here treated purely as a part of natural history.

I proceed to consider the facts which the table indicates :—

Pure Air.—In the natural history of vital phenomena and living being, we must ever remember—just as we do in viewing astronomical or geological phenomena—the great import of small differences and rates ; and further, we must submit our dogmas, and allow Nature's own order and periods of time. Thus, that generation after generation breathe the pure air of the moorlands cannot be ignored as a cause of the freedom from phthisis. The population is sparse—20 acres per person—but the Tavistock granite moor (0·37) is east of Tavistock Devonian (1·82), Tavistock carboniferous (1·96), Launceston carbouiferous (1·76 R. G.), and Holsworthy carboniferous (2·06 R. G.) ; and, therefore (except for conditions embraced in elevation), the air cannot be purer than that of those more westerly regions, which earlier get the westerly ocean winds. Is the result (0·37), then, due to conditions involved in comparative elevation? Against this conclusion is the death-rate of similar granite regions, with about equal elevation, in the Newton granite (1·52), Plympton granite (1·46). Newton and Plympton granite have more farm cultivation than has the Tavistock granite ; the Tavistock moorland people lead a rougher out-of-door life than do the others. Pure air does not seem a full explanation ; it is of great place in the explanation of the phenomena, but it is not the full cause. The vital (whatever that may mean and contain) arises as the result of the fullest co-ordination of man's body, with the entirety of the physical existences of the atmosphere. Pure air, again, has its place no doubt in part, as an explanation of the low death-rate of the Exmoor region (0·45) ; or as, again, the death-rate of the sea-board parishes of the Bideford district is 1·55, whilst that of the more inland parishes is 1·76. Whether from pure air, or dry soil (Devonian formation), or out-of-door life, Lynton, with a mean population of 1,106, Coombe Martin, an adjoining parish, with a mean population of 1,451, each had but one male only die of phthisis in the ten years, 1861-70 ; no female died in either parish in the same period. But these regions of health, both on the granite and Devonian, have great rain-fall.

Digitized by Google

I shall only remind you of the *vast* involvements of physical existences involved in rain, and of their correlations to living being. In various countries the rainy seasons are those of best health. The fact that rain washes the air free from germs, or irritants, is by no means a full explanation; far deeper physical or vito-physical facts are involved.

Soil.—The granite region (0·37) is hilly, and drains well. The Devonian is more healthy than the carboniferous; in North Devon Devonian, Barnstaple, 0·45—0·86; South Molton, 0·95; to North Devon carboniferous, South Molton. 1·42; Bideford, 1·76; Holsworthy, 2·06. Does this difference depend on relative moisture of soil?

Ventilation.—Axminster, Honiton, and Torrington show an excess of death-rate of women:—Axminster, male 1·49, female 2·34 (R. G.); Honiton, male 1·83, female 2·35 (R. G.); Torrington, male 2·21, female 3·08 (R. G.): results probably due to the rooms in which the lace and glove makers sit. Plastered rooms, *without effective means for the continuous escape of foul air*, must cause in a large number the failure of formative "energy," and the sinking of the tissue into tubercular phthisis. Architects rarely supply any means for the *continuous escape* of the slow but surely poisonous foul air.

Huts.—Holsworthy, a damp, "cold," clayey, carboniferous soil has a death-rate of—male 1·77, female 2·35; the population is sparse; 8·75 acres per person. The men are much employed in heavy, wet, farm work; yet their death-rate is but 1·77, to female 2·35. Do the ill-ventilated huts kill the women? or are the men (under such unfavourable conditions of soil toward phthisis) preserved by the out-of-door life, or by the moderate stimulants, or by the tobacco.

Animal Type.—

Lunatics, mean death-rate	20·96
Criminals in Dartmoor, mean death-rate,	2·60

This great contrast of death-rate is chiefly significant of the relation of animal type to phthisis. In a large proportion of young people, who have certain types of skin, hair, nails, teeth, you can predict that at early ages the nerve "force," or "energy," of the lung segments shall cease. So, again, tendency to phthisis corelates with certain mental types. Again, seeing that at the ages of the prisoners at Dartmoor, "that nearly half of all deaths are from phthisis" (R. G.), whilst the death-rate of the prisoners is 2·6 only; either, then, the moorland must be vastly preventive of phthisis in the prisoners, or the physical "type" of man who is criminal is far stronger than that of the population of England and Wales generally.

"*Form*" (F. Bacon) *of Phthisis.*—Phthisis is a natural deviation of growth. "Every diseased structure has a physiological prototype" (Virchow); probable that results which are "common" in some animals, are of the same series as the so-called "specific" in man (Simon). Phthisis is a rapid fever in some regions; a varyingly slow deviation of growth, generally, in Britain; but such variations of type "overlap" in instances. Phthisis has relation of interchange with ague; follows in a series after fevers, &c.; is inoculable; is producable by certain modes of life, and external physical relation; is hereditary; is preventable by certain full natural physical relations and co-ordinations; more related to female than to male lines of being. We thus approach the "form" of phthisis, by so varied external relationships; and again, by the *deeper* lines of the *series of vital evolution.* The "specific" does not belong to its nature. The dual phenomena of evolution and transmissibility must be acknowledged.

Evolution.—From the first splitting of the yolk and germinal vesicle, up to the highest forms of animal life, a necessitous order of series obtains; all the problems arising from mathematical analysis have not yet been solved. We need not be surprised, therefore, that the rates or series of vital evolution are not yet recognised. The word, evolution, expresses that an order of continuous and necessary relationship exists in vital being—an order necessarily related in series with all past forms, with the present variety, and with future contained evolving forms. Now, as the vital "force," or "energy," is a correlated "mode," or "affection," of matter, motion, &c., &c., so not only do we expect to sustain the full period of the longevity of lung tissue in any individual, by an entirety of external physical existences as on Dartmoor; but yet further, by co-ordinating the vital "force," or "energy," by the supply to the body internally, of certain mineral or other elements. In the study of the natural history of the body, geological time must be allowed; the vast involvements of Nature, and the vast "force," or "energy," of the molecules, or "atoms," of matter, remembered.

Sanitarium.—Experience has abundantly shown that the moorland immensely restores the "life" and power of those who are being slowly destroyed by the errors of Western civilisation; and there can be no doubt but that a vast number of those who are what is called "delicate," would have health preserved and strengthened, and even life prolonged, by spending the summer months year after year on the moor.

Conclusion.—I have thus endeavoured not only to lay before you a basis of area and population to phthisis, which I hope is sufficiently wide to indicate a law, but further I have sought to place that failure of vital force, known as consumption, in its true correlations with physical existences, and with the correlated "modes" of matter, &c.; not viewing consumption in any way as a disease, but as a phenomena in the domain of natural history—using the words, "natural history," in their widest sense.

DILATATION OF THE RECTUM IN THE TREATMENT OF HÆMORRHOIDS, FISSURED ANUS, AND AS A PROPHYLACTIC MEASURE IN FISTULÆ.

By WILLIAM A. BYRD, M.D.,
Quincy, Illinois, United States.

ACCORDING to Dr. George T. Center, of Evansville, Indiana, in an able and instructive article contributed to the Feb. 15th, 1879, No. of the *American Medical Bi-Weekly*—"In Verneuil, in presenting lately to the Société de Chirurgie, in the name of one of his old pupils, Dr. Fontan, a brochure, the 'Treatment of Hæmorrhoids by forced Dilatation of the Sphincter Ani,' expressed the opinion that the records contained in this volume, like the facts which M. Verneuil himself has had occasion to collect, are of a nature to suppress henceforth all bloody operations for hæmorrhoids."

What operation, heretofore, has been most generally resorted to in France for the cure of hæmorrhoids I cannot tell, but in America the ligature has been used almost universally by the most prominent surgeons, as their writings testify; and the proper application of the ligature to hæmorrhoids for their cure certainly does not deserve the title of a "*bloody* operation."

For the last eleven years I have been dilating the rectum preliminary to ligating hæmorrhoids, the dilatation being first practised upon Mr. Conner J. R——, of Lima, in this State. In the spring of 1868, I had operated upon him for hæmorrhoids by transfixing and ligating without an anæsthetic, but the operation only gave partial relief, on account of the imperfect manner in which it was performed. The pain was so great that he would retract the rectum in spite of every effort made to prevent it.

At the second operation, assisted by my then partner, Dr. J. W. Greenley, and Mr. Temple H. Davis, a medical student, the patient was put under the influence of chloroform, and ligation undertaken through a speculum. The speculum acting unsatisfactorily, I conceived the idea of inserting the fingers of my left hand, cone shaped, into the rectum, and allowing the tumours to drop into the concavity of the hand, and to transfix and ligate in

Digitized by Google

that situation. The hand acting as a wedge, caused the sphincters to give way, allowing the rectum to roll out as in partial prolapsus. The tumours were then easily ligated without transfixing.

The operation was done in the morning.

The patient being a photographer, and having some customers come from a distance in the afternoon, who desired their portraits taken, got up and went to work, contrary to instructions. He made an excellent recovery, and has remained well ever since.

The same spring, with the same assistants, I operated upon Jacob T. for fissure of the anus, by inserting my fingers wedge-shaped into the rectum, intending in this instance, as in the former operation, to use the hand for a speculum, and to divide the fissure with a knife in the concavity of the hand. The wedge action of the hand caused a rent to occur at the location of the fissure of such depth that I considered the cutting operation unnecessary. He made a good and speedy recovery.

These two operations taught me that by dilating the anus, the rectum could be easily everted, and tumours brought external to the body, and readily operated upon. And farther, that the sphincters after dilatation readily regained their tone, permitting free and painless evacuations after operations involving loss of tissue from the use of the ligature.

Hearing other operators complain that patients were not entirely relieved of pain and difficulty during defæcation, after the use of the ligature in the treatment of hæmorrhoids, I concluded that my patients were exempt from after trouble on account of the preparatory dilatation, and have invariably dilated in the cases that I have operated upon since.

In many of the cases I have had the kind assistance of Drs. J. N. Ralston, L. H. Cohen, Francis Drude, J. T. Wilson, J. E. Cheney, Jacob A. Wagner, J. C. Pearson, Wm. M. Landon, E. G. Pugh, and other professional gentlemen.

The best speculum in these operations is either the human hand or a loop of strong wire, having the patient either in Sims' position or upon Bozeman's chair.

Dilatation alone is insufficient to cure the trouble from hæmorrhoids. After the dilatation, where the lax areolar tissue and dilated vessels were, will become infiltrated, and, the infiltration being absorbed, there will be left teat-like processes—I generally call them *dog-ear* excrescences—larger or smaller as the case may be, which, rubbing against the opposite wall of the rectum, will cause irritation, or sometimes a fissure or return of the hæmorrhoidal trouble. Inspissated mucus or husks of grain or small seeds becoming lodged in the folds of these tumours, cause excoriation, itching, and great uneasiness.

Most surgeons having experience in the treatment of diseases of the rectum have seen this condition, as it is frequently the result of spontaneous cure of hæmorrhoids.

I recollect being called some four or five years ago to see a middle-aged lady, who had been a great sufferer from "bleeding piles" in her earlier life, to relieve her of a very troublesome itching and uneasiness about the anus. There had been no bleeding for several years. Upon examination I found ten such tumours as I have described, just within the anus, some being over an inch in length. With the assistance of Dr. L. H. Cohen, I dilated the anus and removed them; the lady has suffered no inconvenience since.

After dilatation this lax tissue should be ligated so as to cause it to slough. In ligating it is both tedious and unnecessary to transfix the tissue with a needle and thread. The tissue should be caught up with a good strong forceps with broad jaws, and held tense by an assistant while the surgeon applies the ligature of strong flax thread, very tightly, just below the forceps; or, a better plan, and the one I now adopt, is to take up the hæmorrhoidal tumour in Smith's clamp, or between the jaws of an artery forceps, and cut it off with the galvano-cautery.

Irritation of a muscle, within certain limits, causes functional activity, functional activity causes hypertrophy, and a continuance of the irritation and activity causes what Dr. L. A. Sayre denominates contracture. The same law applies as well to the sphincters of the rectum as to the muscles of the extremities.

When the powerful sphincters become hypertrophied and contractured, the muscular coats of the intestine immediately above them being insufficient to withstand the ever-increasing deposit of fæces from above, become partially or completely paralysed, and at times enormously distended.

This condition will generally be found in connection with fistula in ano. The irritation of the abscess, that is, the beginning of the fistula, causes the sphincters to become functionally active and hypertrophied, and the painfulness of defæcation being added, causes the fæces to be retained and the rectum to become an immense pouch. Now cure the fistula with the knife, elastic ligature, or galvano-cautery wire, the sphincters are left hypertrophied, and the cicatricial tissue being tender, the weight and irritation of the fæces in the pouch above will very likely cause a recurrence of the trouble; but paralyse the sphincters by over-distension, and then cut out the fistulæ, and the rectum and sphincters will regain their tone *pari passu*, and the patient will remain well.

The first case that I put this idea to the practical test in was that of a German stone-mason, whom I saw with Dr. Francis Drude in the fall of 1873; there were five fistulæ around the anus, one extending clear across from the tuberosity of one ischium to the other, passing immediately in front of, and opening into, the anterior portion of the rectum. I first dilated the sphincters well with my hand and then laid the fistulæ open with a bistoury.

He made a good recovery, having no more rectal trouble up to the time of his death last summer.

Some time after this operation I saw a case of fistula in ano with another physician, where he operated without the preliminary dilatation, and the doctor informed me some three months after the operation that the fistula had re-formed, and the patient was as badly off as ever.

About the 1st of February, 1879, John McN—— called on me for relief from difficult and painful defæcation. He had had fistula in ano, and had been operated upon twice for the relief of the trouble within the six preceding months. There were cicatrices marking the site of the former fistulæ, with considerable inflammatory swelling posterior to the anus; the sphincters were in a state of contracture, and there were two or three "dog-ear" remnants of old hæmorrhoidal tumours just within the rectum. The rectum was dilated and full of hardened fæces.

I sent him to St. Mary's Hospital on Feb. 7th, and with the assistance of Dr. J. A. Wagner, dilated the sphincters and removed the tumours with the galvano-cautery.

He had small passages from his bowels daily for four days, but the hardened mass was still retained. An injection of warm soap-suds was given through a rectal-tube, reaching 12 inches up the bowel, which brought away an enormous mass of hardened fæces. In ten days he was discharged well, and has worked at his trade, coal-mining, ever since.

Of all the cases that I have operated upon by dilatation and ligation, or destruction of the hæmorrhoidal tumours with the galvano-cautery, there has been no recurrence of the disease so far as I have heard.

Different instruments have been made use of for dilating, as have the thumbs of the two hands, but I have found no means so satisfactory and effectual as the insertion of one hand, the fingers being brought together so as to form a cone, which acts as a wedge in dilating. If the sphincters are not overcome by the wedge when the hand

Digitized by Google

is inserted as far as the junction of the phalanges and metacarpal bones, closing of the hand will accomplish the result fully and satisfactorily.

Translations.

HYSTERIA MAJOR.

By PROFESSOR CHARCOT,
Physician to the Salpetrière Hospital, Paris; Member of the Academy of Medicine of France; Fellow of the Clinical Society of London, &c.

Abstracted by T. M. DOLAN, F.R.C.S.Ed., Halifax, Yorks. (a)

I. AUTHORS recognise two kinds of hystero-epilepsy:—

1st. *Hystero-epilepsy, with distinct crises*, in which the symptoms of hysteria and epilepsy manifest themselves separately, at one time under the form of an hysterical attack, at another of an epileptic fit.

2nd. *Hystero-epilepsy, with mixed crises*, in which the symptoms of hysteria and epilepsy are blended. These mixed crises for a long time have been called by the employés of the Salpetrière by the significant name of *Attaques-accès*.

The second form is now only under consideration.

M. Charcot, for a long time, has held the opinion that hystero-epilepsy, with mixed crises, is only hysteria in an intense degree, and to avoid all confusion he proposes to call this form of disease, Hysteria Major, named by Louyer-Villermay, Epileptiform Hysteria.

The convulsive attacks seen in hystero-epilepsy, thus understood, have been for a long time considered as a confused mixture of prodromata, some hysterical, others epileptoid, entangled in an inextricable manner, and for that reason escaping all methodical and regular description. In opposition to this opinion, M. Charcot is endeavouring to demonstrate that all these phenomena, apparently so disorderly and so variable, develop according to a rule, a law. He describes, from Nature, a type of a complete attack, a kind of standard to which may be attached, in their numerous varieties, imperfect, incomplete, or abnormal attacks.

Description of a Complete Attack.

A complete attack is composed of four periods; it is preceded by prodromata.

A. Some days previously, the patient is taken with malaise, loss of appetite, and vomiting. She becomes taciturn, melancholic, or is a prey to excitement, which renders surveillance sometimes very difficult. The hæmi-anæsthesia increases in intensity, the insensibility extends sometimes to both sides of the body. Oftentimes she resists the action of æsthesiogenic agents (metallic applications, magnet, &c.) which have acted, more or less rapidly, in ordinary conditions. The hemi-asthenia equally increases.

Visual hallucinations are most frequent, consisting of visions of animals, as cats, rats, vipers, crows, &c. The hystero-genic zone is most sensitive, a slight excitement of the integument of this zone being sufficient to develop convulsions. Cramps sometimes come on, with trembling, limited to the members, or general agitation, accompanied with vertigo, which have a great analogy with what Herpin, in the domain of epilepsy, calls *epileptic commotion*.

The phenomena of aura-hysterica very soon show themselves, preceding immediately the attack, and appearing in the following order:—Ovarian pain, irradiations towards epigastrium, palpitation, sensation of globus hystericus in the neck, singing in the ears, sensation of blows of a hammer in temporal region, annihilation of sight.

Then loss of consciousness marks the *début* of the attack, which develops in the following manner:—

1st. *Epileptoid Period.*—It may resemble, and may be mistaken for, an attack of true epilepsy; convulsions tonic, clonic with stertor. But in spite of the appearances, two facts positively prove that epilepsy is only there in form:—

a. Ovarian compression, if an ovary exists, will arrest, more or less sharply, the convulsions, at whatever period it is tried.

b. The electric current has a similar effect, and strong friction over the hystero-genic points.

Now, these means will not arrest, or even diminish, the convulsions of true epilepsy.

This epileptoid period may be divided into three periods:—

a. Tonic Phase.—This often opens with movements of circumduction of the upper extremities, with loss of consciousness at the same time, with momentary arrest of respiration; pallor, followed by redness of the face, swelling of the neck, distortion of the features, and sometimes protrusion of the tongue. The cry, noticed by writers, is more frequently reduced to a hissing inspiration, and to a guttural noise. The tonic phase terminates by tetanic immobility of the whole body.

b. Clonic Phase.—The limbs and the whole body are animated by short and rapid oscillations, the length of which increases by degrees, terminating in some general shocks. The muscles of the face, set in action by the same movements, render it horrible.

c. Phase of Resolution.—The face remains swollen, the eyes are closed, all the muscles are in complete resolution, respiration becomes stertorous.

2nd. *Period of Contortions and Major Movements.*—After a moment of calm, following the stertor, the second period begins. It is constituted by two orders of distinct phenomena—contortions, and major movements. The contortions consist of strange attitudes, which only seem to belong to the laws of the impossible, the strange, and the illogical. These attitudes are very varied, the most common being the arc of a circle. The patient is curved backwards, the feet and head alone rest on the bed, the abdomen forming the summit of the curve.

The movements consist most frequently of rapid oscillations, the most frequent movement being the following:—The patient straightens herself as if to sit up, her head lowers to the top of the knees, then she turns brusquely round, striking violently at the pillow; this movement she repeats, perhaps, twenty times running. It is often preceded, or interrupted, by automatic cries, the piercing character of which resembles the shriek of a railway-whistle. At other times the movements are completely disorderly; the patient seems to struggle against an imaginary being, or endeavours to release herself from imaginary bonds. She raises dreadful cries; she is seized with a kind of rage, which impels her to strike, bite, and tear her hair.

3rd. *Periods of Attitudes of Passion.*—Hallucination manifestly presides over this third period. It is easy to follow the course of the drama in which she assists, and where she plays the principal *rôle*, for she now assumes a part, and acts with expressive and animated pantomime, interpolated by casual expressions. Two very different orders of ideas ordinarily enter into hallucinations of the patient. The tableau has two sides—one, *gay;* the other, *sad*. In the first, the patient believes she is transported into a magnificent garden, a kind of Eden, where all the flowers are *red*, and the inhabitants clothed in *scarlet;* music heightens the enjoyment, and she here meets with the object of her dreams, or of her previous affections. Erotic scenes sometimes follow. In the second, she dwells on fires, war, the Commune, assassination, and almost always there is bloodshed.

4th. *Terminal Period.*—At last, the patient returns to the real world. She recognises the persons surrounding her, but she remains for a long time in a state of delirium. She is often melancholic, and troubled by hallucinations. She sees animals, rats, black cats, vipers, crows, &c. These visions cause the greatest terror, principally showing themselves on the hemi-anæsthetic side, pointed out by Charcot, as taking place in periods of calm. Sometimes very painful general contraction takes places, which rapidly disappears; or painless partial contraction, which may last a long time.

This regular or typical attack, composed thus of four periods, has a mean duration of a quarter-of-an-hour; but it may be repeated, so as to form a series of attacks, varying in number from twenty to two hundred. The patient may thus remain in a kind of *etat de mal*, somewhat analogous to to the state of *mal epileptique;* this may be prolonged for twenty-four hours or more. It is important to bear in mind several diagnostic characters:—The absence of

(a) *Progrès Medical.*

Digitized by Google

thermic elevation, which would be noticed in epilepsy; the influence of compression of the ovaries, of the galvanic current, of friction over the hystero-genic zones, &c.

(To be continued.)

Department of Lunacy.

GERALD MAINWARING.

From information and data placed in our hands respecting Gerald Mainwaring, convicted and subsequently reprieved for the murder of a police-constable at Derby on the 12th ult., we are in a position to give what we consider to be important facts connected with the case.

The prisoner received his earlier education at Rossall School, and after leaving school he resided with his father in Staffordshire; at this time it appears he evinced marked peculiarities, he became very taciturn, and avoided the society of others, preferring solitude to even the association of those most intimate, causing remarks and suspicions among his friends, so that even at this period he was considered eccentric. He left England in 1875 for Canada, remaining there for four years. Whilst there he conducted himself so far well as to avoid getting into any scrape, residing with Capt. Brereton, Stipendiary Magistrate, in Toronto. He returned to England in 1879 in consequence of the removal of Capt. Brereton's family from Toronto, the death of his father, and disappointment at not receiving remittances from England, for which he had written in pressing terms.

Shortly after his return to England he visited his brother at Oxford, but whilst there only drank claret, stating that "brandy made him mad." But we shall have more to say upon this point when we come to the consideration of the hereditary predisposition to drinking and the general effect that alcohol appears to have had upon members of his family. One peculiar feature, and what we consider to be most material in connection with his case is, the circumstance that none of the prisoner's family ever saw him the worse for liquor, so we are credibly informed.

With regard to his antecedents, we have reason to believe that other members of his family were equally liable to become affected from indulgence in alcohol.

We thus have a man who, from his own statement, had a horror of strong drink, and evidently keen and apprehensive as to the danger of imbibing brandy, but at the same time one who could be easily led astray by any person who endeavoured to guide him in the wrong direction, of strong animal passions, and by nature headstrong.

The murder was committed on the 12th of July, and we have evidence of the prisoner drinking incessantly from the 10th to this date, the liquor chosen not being ordinarily wine, but brandy, of the effects of which he had such a fearful dread, as appears from the remark made to his brother at Oxford that "brandy made him mad." Once, however, forgetting this circumstance, and indulging in it, it was impossible for him to desist. The more brandy he took so the fatal fire gradually increased until it accumulated in one maddening flame, rendering his brain in such a state of excitement as to make him not only heedless of what he did, but ignorant of the gravity of his acts, and consequently irresponsible for his crime.

The question for the jury was, whether his state was such as that he was to be held irresponsible for the murder, and whether a verdict of manslaughter or murder should be returned. To determine this vital question the jury were upwards of three hours in deliberation, evidently showing the grave doubts which must have existed in some of their minds. One most important fact is, that the jury unanimously signed and forwarded to the Home Secretary a petition expressing their conviction that the prisoner was, at the time he fired the pistol, "in a state of complete intoxication, and had no intention of doing an illegal act, or deliberately inflicting harm on the deceased, Joseph Moss, or any other person."

With regard to the way in which they arrived at their decision it is no province of ours to discuss, suffice it to say, that it will doubtless prove a death-blow to trial by jury when scientific questions are involved. We have frequently advocated the necessity of medical assessors, and had they been employed in this case, a British jury would never have come to the conclusion that Gerald Mainwaring had committed wilful murder with malice aforethought, and that at the time he did so he was in such a normal mental state as to be held responsible for his actions.

THE EXHIBITS AT THE CORK MEETING OF THE BRITISH MEDICAL ASSOCIATION.

The display of Novelties in the shape of New Preparations in Medicine and Pharmacy, American Specialties, Surgical Instruments and Appliances, equalled, if it did not excel, most previous exhibitions under the auspices of the British Medical Association.

In the Medical Department, those firms not occupying a special stand were mostly represented by Messrs. Goulding, of Cork, who had a most attractive display of preparations of home manufactures and many American specialties.

In the Surgical Department, Messrs. Fannin & Co., of Dublin, fathered in like manner, several well-known manufacturers of instruments and surgical appliances. This firm also had an extensive stock of the newest books in medicine, surgery, and allied sciences, the products of most of the leading London publishing houses. A brisk trade seemed to be done at many of the stalls, and we hear that several of the exhibitors are quite satisfied with the results. As this admission has not been made for several years past, it argues either, that the meeting was more popular than those which have preceded it, that there was more money, that the exhibits were more attractive, or that the wants of Irishmen were greater.

We will now proceed to chronicle a few of the leading articles shown, with the names of their manufacturers, &c.

CORBYN, STACEY, & CO., London.

The exhibit of this old-established firm was, as usual, varied and extensive, and here the latest novelties in pharmacy could be seen, side by side with such new remedies as Ext. fucus vesiculosus. Liq. opii dialysatus is only just introduced by the firm, and we should anticipate that it will be largely used by those who have to prescribe opium—we hope to report on this more especially on a future occasion. Suppositories, bougies, and coated pills would not seem to afford much scope for pharmaceutic art, but as shown by this firm it will be seen that high art can be attained in their manufacture. Amongst the articles and preparations exhibited, which

Digitized by Google

showed careful choice and great elegance, we more particularly note Adonis vernalis, a non-cumulative substitute for digitalis; chaulmoogra oil, the alterative remedy for skin diseases; coto bark and curara; damiana, a well proved aphrodisiac; euonymin; grindelia robusta for asthma; Ndilo oil, the Fiji remedy for rheumatism; psoralea Corylifolia, the Hindoo remedy for scanty hair; and the now well-known and widely appreciated Valentine's meat juice. Full particulars of all these and numerous other drugs, etc., will be found in "Notes on Drugs," 14th ed., published by this firm, and supplied we believe gratis to medical men.

SAVORY & MOORE, London,

had a stand where they exhibited a great number of their well known specialties, such as pancreatic emulsion, pancreatine, pepsine, datura tatula in the form of cigarettes and cigars for smoking in cases of asthma, and also all their gelatine preparations, comprising lamels for internal, and discs for hypodermic and ophthalmic, use. They also exhibited a great number of preparations of recently introduced drugs, such as the tincture and liquid extract of jaborandi, the liquor fucus vesiculosus, recommended for use in cases of morbid obesity, and the tinctures of boldo, coca, coto, sabadilla, &c. We also noticed an exceedingly ingenious little apparatus, known as Felton's inhaler, which was shown in operation, for the inhalation of the vapour of chloride of ammonium and other medicated vapours; amongst other advantages it is exceedingly compact, occupying but the space of an ordinary 3 oz. bottle. Messrs. Savory & Moore also exhibited splendid specimens of granular effervescent salicine and salicylic acid, and other granular preparations, and also numerous samples of the American eclectic preparations.

GOULDING & CO., Cork.

As before mentioned this firm exhibited for several manufacturers. Amongst the specialties were the popular elixirs of America, numbering about a dozen combinations. The term elixir in this case is applied to liquid preparations, made palatable and attractive by the aid of skilled pharmacy, without destroying their medicinal characteristics. Although not in the British Pharmacopœia they are, nevertheless, consistent materia medica adjuvants, and will probably occupy a good deal of attention in this country.

PARKE, DAVIS, & CO., Detroit, Michigan,

one of the largest manufacturing drug houses in America, displayed a large number of samples of some of their products, which they distributed among the members of the Association. There were improved empty capsules in six different sizes, prepared with gelatine. These little capsules are said to be very soluble, and of great value and convenience to the practitioner, who studies to remove the objectionable properties of certain remedies, which he deems it necessary to employ. Sugar-coated pills, oval in shape, coated while the mass is yet soft, very elegant in appearance. Fluid extracts, representing in one fluid ounce the properties of one troy ounce of the crude material, of the following new remedies:—*Berberis aquifolium*, a new Californian drug; *Cascara sagrada* (*Rhamnus Purshiana*), for habitual constipation; damiana, an aphrodisiac; evening primrose; used in respiratory and gastric troubles; five-flowered gentian, a tonic and antiperiodic; grindelia robusta, for asthma; quinine flower, from Florida, possessing strong antiperiodic properties, resembling quinine in its action; *Ustilago Maidis* (corn ergot), a substitute for ergot of rye; *Viburnum prunifolium* (black haw), for the prevention of abortion; *Yerba reuma*, for diseases of the mucous passages; *Yerba santa*, for bronchial and laryngeal disorders, and many other new preparations.

WYETH & BROTHER, Philadelphia, U.S.A.

This firm's exhibit covered the space next to Goulding's, and presented a very handsome appearance. Their specialty is the "Wyeth Dialysed Iron," modern dialysis being the most concentrated mode of manufacture. According to the analysis of Prof. Tichborne this preparation contains 27·68 grains to the fluid ounce, and is put up in handsomely fitted cases with dropper, so that it may be taken without any inconvenience or trouble to the patient. There was also a large display of Wyeth's well known compressed tablets, &c.

THE MALTINE MANUFACTURING CO., London.

This preparation is now so well known to the profession that little need be said of it here. It has undoubtedly become one of the most popular of the malt extracts, containing in a highly concentrated form malted barley, malted wheat, and malted oats, with all the nutritious principles that can be extracted from these cereals by the most carefully conducted scientific process of manufacture. The same company also showed their various combinations with cod-liver oil, quinine, &c., and through Messrs. Goulding & Co. freely distributed large sample bottles of maltine to all whose pockets were not already too full with specimens of other enterprising manufacturers.

KEPLER EXTRACT OF MALT CO., London.

So much has been said about the various extracts of malt and its compounds, some of which have been worthless, others again simply beverages, that the profession have had considerable difficulty in selecting the best article. Upon the space next to S. M. Burroughes & Co., and represented by that firm, were the Kepler extract of malt, and the Kepler extract of malt and cod-liver oil, tastefully arranged and inviting the criticism of the unbiased. These preparations are, we believe, like "maltine" thoroughly reliable, and are what they are represented to be.

ZOEDONE.

Special attention having been drawn by Dr. Norman Kerr and Dr. Carpenter, at the Temperance breakfast, to the new beverage zoedone of which Mr. David Johnson is the patentee, it received a good deal of notice in the museum. This preparation, containing the phosphates of lime, iron, &c., in perfect solution, is commendable equally for the style in which it is put up, and the delicate flavour which it possesses. We commend zoedone to the notice of those who had not the opportunity of tasting it at the museum. Being non-alcoholic, it will find favour with many on temperance grounds, and also on account of its merits as a nervine tonic. Richard Evans & Co., of Wrexham, are the manufacturers.

MAW, SON & THOMPSON, Aldersgate Street, London,

exhibited a fine collection of amputation instruments of their own special manufacture, also a few specimens of excellent lithotrites, embracing all the modern improvements. Ecraseurs of special construction for easy removal of wire; circular sphygmograph; resection saws, with improved spring handle allowing the blade to be placed at any angle. There was also a very fine collection of the new patent seamless Higginson's syringe, superseding all others, possessing, as they do, the great advantage of not splitting, and absence of all metallic connections. These were very much admired, and doubtless will take a lead in this class of goods.

ARNOLD & SONS.

This firm had as usual an extensive display, including a cheap form of their patent simplex enema, which will supersede many of the old-fashioned patterns. Their patent self-lubricating plunger fitted to aspirators, syringes, enemas, &c., is most useful, as it renders the plunger always moist and ready for use at any moment. They also exhibited an extensive stock of their patent clinical thermometer which has lately been much reduced in price, the effect of which will doubtless ensure a large demand, as thermometers from frequent breakage, are a constant source of expense. Dr. Godson's pocket gynæcological case is quite a *multum in parvo*, is likely to become popular as it contains everything requisite, and yet can readily be carried in the pocket. An assortment of Mr. Callender's splints was also shown for the painless dressing of stumps; Dr. Southey's trocars exhibited by this firm are certainly very beautiful and delicate little instruments. Messrs. Arnold also displayed several of their new patent constant current batteries, Dr. Shepard's combined vaporiser, bronchitis kettle and inhaler, and other useful instruments, and adjuncts to surgical art.

SALT & SON, Birmingham,

exhibited a varied collection of novelties in medical appliances and surgical instruments, among which may be noticed Professor Hughes' audiometer for ascertaining the various capacities for hearing of different persons, and of the same person in the various stages of treatment. This instrument was brought under the notice of the Otological sub-section, by Mr. Lennox Browne. This firm is noted for its specialty in the neat and portable arrangement of different sets of pocket instruments. Among them was a case not larger than a small snuff-box, and containing no fewer than fourteen fair sized instruments of the descriptions usually carried in an ordinary pocket case. They also showed a separating model, coloured to nature, of the female pelvis, showing the internal organs

Digitized by Google

of generation, made by Dr. Azoux, of Paris; and a number of thermometers of different shapes and sizes, the glasses of which are so constructed as to form lenses which magnify the slender index (often troublesome to read), so as to render it conspicuous, even to failing sight or in a dark room without impairing the sensitiveness of the instrument. Generally, their collection was noticeable for its ingenuity, novelty, and careful selection.

HILLIARD & SON, Glasgow,

exhibited a collection of instruments selected on account of their novelty, and to show the special patterns at present used in Scotland. They exhibited a variety of inventions bearing the name of Dr. Foulis, of Glasgow, for throat cases. His artificial larynx with voice, used by a patient for many months to replace the natural vocal cords excised, is unique, and especially worthy of notice. This firm also showed a large collection of specula, including Tarnier's, Leishman's, and Christie's. A double bag for stopping flooding of the uterus, invented by Dr. Christie, of Letterkenny—a clever application of hydrostatic laws to produce the requisite pressure and cold, uniting the variable and constant with great ingenuity. Dr. Yellowlee's new bottle for feeding by stomach tube without valves, of special benefit in lunatic asylums. A model of splint used by Dr. Eben Watson, of Glasgow, for excision of knee-joint. Various patterns of sprays, from Austria, Germany, and Sweden, and Fleming's sphymographs.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, AUGUST 27, 1879.

PROFESSOR ALLMAN AND MATERIALISM.

ORTHODOX folk will not be so astonished at the address which Professor Allman has just given before the British Association, as they were at that which Professor Tyndall delivered on a similar occasion in 1874. There are some, even in our profession, who think there is as little difficulty in conceiving thought to be a property of the cerebral cells as there is in conceiving attraction to be a property of the magnet, and contraction a property of muscle. This is not the case with Professor Allman, who expresses himself with a reserve that is characteristic of a true philosopher. "When," he remarks, "we say that life is a property of protoplasm, we assert as much as we are justified in doing. . . . When a thought passes through the mind, it is associated, as we have now abundant reason for believing, with some change in the protoplasm of the cerebral cells. Are we, therefore, justified in regarding thought as a property of the protoplasm of these cells, in the sense in which we regard muscular contraction as a property of the protoplasm of muscle? . . . If we could see any analogy between thought and any one of the admitted phenomena of matter, we should be bound to accept the first of these conclusions . . . but between thought and the physical phenomena of matter there is not only no analogy, but there is no conceivable analogy. . . . The chasm between unconscious life and thought is deep and impassable, and no transitional phenomena can be found by which as by a bridge we may span it over; for even from irritability, to which, on a superficial view, consciousness may seem related, it is as absolutely distinct as it is from any of ordinary phenomena of matter. That consciousness is never manifested except in the presence of cerebral matter or of something like it, there cannot be a question; but this is a very different thing from its being a property of such matter in the sense in which polarity is a property of the magnet, or irritability of protoplasm. . . . The power of conceiving of a substance different from that of matter is still beyond the limits of human intelligence, and the physical or objective conditions which are the concomitants of thought are the only ones of which it is possible to know anything, and the only ones whose study is of value. We are not, however, on that account forced to the conclusion that there is nothing in the universe but matter and force. . . . Whatever may be that mysterious bond which connects organisation with mental endowments, the one grand fact—a fact of inestimable importance—stands out clear and freed from all obscurity and doubt, that from the first dawn of intelligence there is with every advance in organisation a corresponding advance in mind. Mind as well as body is thus travelling onwards through higher and still higher phases; the great law of evolution is shaping the destiny of our race; and, though now we may at most but indicate some weak point in the generalisation which would refer consciousness as well as life to a common material source, who can say that in the far off future there may not yet be evolved other and higher faculties from which light may stream in upon the darkness, and reveal to man the great mystery of thought?"

These are fine thoughts finely expressed, and therefore the reader must excuse the length of the above quotation. Nor is there anything in these observations to which the modest and philosophic materialist can take exception, unless it be the seeming inconsistency between the Professor's views on the potentiality of protoplasm, and those which he holds respecting the potentiality or property of cerebral matter. It is difficult and even impossible for anyone not under the influence of the superstitions and prejudices of the day, to conceive of a "substance different from that of matter;" of mind being an entity distinct from, though

Digitized by Google

working through the brain. There may be something of the kind, but at present we have no proof of it, whereas we have undoubted proof that thought and consciousness are never manifested except in the presence of cerebral matter. We will even go farther, and say that the materialist is justified in saying that, in all probability, "physical or objective conditions" are something more than the mere "concomitants" of thought. Professor Allman says that "of two particles of protoplasm, between which we may defy all the power of the microscope, all the resources of the laboratory, to detect a difference, one can develop only to a jelly-fish, the other only to a man, and one conclusion alone is here possible—that deep within them there must be a fundamental difference which thus determines their inevitable destiny, but of which we know nothing, and can assert nothing beyond the statement that it must depend on their hidden molecular constitution." If, therefore, there must be, as few will deny, in these different kinds of protoplasm, "some fundamental difference which determines their inevitable destiny," and the detection of which appears to be far beyond the reach of either the microscopist or the chemist, why may there not be some real physical, albeit inconceivable, phenomena going on within the living cerebral cell, of which thought and consciousness may be regarded as the expression or property, with as much truth as we regard polarity as a property of the magnet? In the case of certain physical phenomena, we do not know *how* or *why* they should belong to the agents by which they are respectively conditioned, and the materialist might argue that there is no more difficulty in conceiving thought or consciousness to be a property of cerebral matter than to conceive how and why under certain conditions electricity is developed, or why polarity is a property of the magnet. If, he might say, there is no analogy between thought and any of the admitted phenomena of matter, neither is there any analogy between the structure of a piece of iron and the fine and delicate organisation of a cerebral cell. Why, moreover, does Professor Allman allow "Life" to be a property of a tiny lump of transparent, structureless, and semi-fluid substance, called protoplasm, and not allow that thought and consciousness are properties of the delicately organised cerebral cell? If there is no analogy between thought and ordinary physical phenomena, there is surely some analogy between the phenomenon of thought and that of life. Nor is the difficulty of forming a conception of a physical basis of mind any valid argument against such a belief, any more than the difficulty of conceiving of a substance different from that of matter is a valid reason for our saying that there is nothing in the universe but matter and force. We cannot, therefore, find so much fault with the views which certain materialists have taken of these questions, as with the bold and confident tone in which they have expressed them. For some would have us believe in the almost illimitable potentiality of matter, and that the materialistic origin of thought is as intelligible as any physical phenomenon with which we are acquainted. So they complacently talk of the inconceivable number of molecules entering into the composition of the cerebral cell, with the countless and never-ceasing motions of, or changes in, those molecules, as the several conditions of the numerous phases of thought and consciousness which constitute the mental phenomena of our being. And what is more, they say all this with as much assurance as if they had actually witnessed the molecular changes or molecular motions, which they assume to be the physical and only basis of thought. To regard a proposition as highly probable is one thing; to say that it is an undoubted and approved fact is quite another. If we were asked on which side the truth will probably be hereafter found to lie—with those who believe in the materialistic basis of both vital and mental manifestations, or with those who believe in the existence of a something altogether distinct from, although generally associated, with matter—we should certainly say with the former. We say "probably," for perhaps it would be unwise to regard either pure materialism or the theory of evolution as amongst the best established facts in science. Nevertheless, what is to day but a bold hypothesis or theory, may be to-morrow unquestionable truth; and perhaps as time rolls on it will be found that the present theories of materialism and evolution have turned out to be the nucleus of some of the grandest generalisations it has been in the power of man to discover.

THE VACANT OFFICE OF REGISTRAR-GENERAL FOR IRELAND.

THE unexpected and regretted death of Dr. Malachi Burke has, as might be anticipated, given rise to most animated controversy and hot competition within and without the profession in Ireland. The salary of the office being £1,000 a-year, and its rank being one of the highest amongst official positions in Ireland, it was to be expected that it would be the subject of eager competition, not only on the part of those whose experience in and knowledge of the registration system gave them recognisable claims, but on the part of a multitude of hangers-on to the skirts of Government whose only claim to the Registrar-Generalship is that derivable from a fussy and ostentatious political partisanship. We refer to the matter to-day specially to protest, in the name not only of the profession, but on behalf of the public health of Ireland, against the selection of any person uneducated in the subject, and unqualified in mind to undertake the onerous and signally important functions of Registrar-General for Ireland. The history of the Registration Department in Ireland bears forcibly upon our protest. The office came into existence on the passing of the Registration (Ireland) Act in 1864 and Dr. Burke was then appointed Medical Superintendent of Vital Statistics, under the supervision of Mr. Donnelly, the Registrar-General. Thus the absolute necessity of employing medical knowledge and experience in the classification of the statistics of the department was recognised by the Act and by the Government. For fourteen years Dr. Burke held office in this capacity, and the wisdom of placing a medical man in control was made evident by the improvement in the registration system, and in the accuracy of the information relating to the vital statistics of Ireland which the reports from the office afforded to statisticians. When Mr. Donnelly became incapacitated from active duty Dr. Burke was at once placed in supreme

Digitized by Google

control of the department, and on the retirement of his chief he was made Registrar-General, the office of Medical Superintendent being abolished, as obviously unnecessary while a medical man was at the head of the office. Since then Dr. Burke administered the registration of Ireland, not only without fault, but with obvious success and advantage to the public service, and on no occasion did any question arise with which he had any difficulty in grappling. By the consolidation of the two offices the taxpayer was relieved of a charge of £600 a-year, and the duties of the office were much better discharged than at any previous period.

Although the clamorous candidature of a number of lawyer-politicians and of others who do not possess any medical knowledge, have impelled us to speak on behalf of the unchallengably superior claims of a medical man to the office, we can hardly think that any suggestion from us is needed to make plain to the Government or to the public that the official who is to classify health and disease ought to be a person who knows something of these matters. It appears scarcely necessary to urge that a lawyer, or a head clerk, however politically useful or personally efficient, is not the right man to employ to classify zymotic diseases, and to read for the public advantage the sanitary lessons derivable from a side-by-side study of the frequency of these diseases; and we shall hardly gain much credit for our prophesy, if we predict that a registration of disease or of mortality entrusted to those who know nothing of the matter, would be not only useless but a nuisance, and misleading to sanitarians.

Registration of disease has come to be one of the burning questions of the day, and has occupied the recent Congress at Cork as an urgently required addition to our registration system. Is it to a mere politician, or to a mere office administrator, that the development of such a system is to be entrusted? We hope not.

It would be a monstrous proceeding to leave the supervision of vital statistics in Ireland without the aid of a medical expert; and almost equally objectionable to re-create an abolished office, and re-establish an abolished salary, in order that a political supporter should be satisfied.

We have not yet heard a syllable of reason why there should be two offices, or why a medical man should not fill the superior and responsible department, as Dr. Burke did; and we have full confidence that a Government, which prides itself in not making mistakes, will not violate common sense and public feeling by appointing any person save he who can truthfully lay claim to a full knowledge of the classification of disease.

THE ADVANCEMENT OF THERAPEUTICS.

That part of Dr. Andrew Clark's address before the British Medical Association which treated of therapeutics should not be allowed to fall from the memory of those who wish to take an active part in the advancement of practical medicine. To us the theme is particularly interesting. It is one which has often engaged our attention, and our views of which in a great measure correspond with those so well expressed by Dr. Clark in the course of his address.

Some may think that this physician has taken a rather pessimist view of this present state of therapeutics. We hold a different opinion. Indeed, some weeks ago, when writing on the future prospect of hygiene or preventive medicine, we ventured to assert that, excluding surgery from consideration, curative medicine has been up to the present time, *comparatively* speaking, a failure; and that, judging from our past and present experiences, it seems as if the future aim of medicine should be directed rather to the prevention than to the cure of disease. At the same time, it must be admitted that ages must elapse before the work of the sanitarian has left the therapeutis nothing to do; and therefore there are good grounds for our trying to place on a surer basis a department of medicine which will be for some time to come capable of being of no little service to mankind.

The chief allegations which Dr. Clark has made in respect to the backward or stationary condition of therapeutics, are such as few will be inclined to gainsay. Too much attention is given to materia medica, too little to therapeutics. Of the natural history of disease we know little or nothing, and therefore we have no trustworthy information about the respective powers of nature and art in recovery from disease. We do not know exactly in what condition we may employ the known physiological properties of drugs with any sure prospect of success. There exists no accurate account of the phenomena, physiological, pathological, or chemical, which accompany the administration of remedies, the effect of which are in some degree certain, but the modes of action of which are utterly unknown. There exists an assumption that the effect of drugs upon living tissues in a state of health are identical with those which the same drugs have upon the tissues in a state of disease. Moreover, the cultivation of animal chemistry in its relation to pathological and therapeutic processes is much neglected. Lastly, there is a "strange and fantastic" theory that diseases are immutable, and that the types of morbid action are for ever the same. Such are, briefly put, the conclusions which Dr. Clark has arrived at on the subject, and certainly with one important exception to be presently noticed, he has taken a pretty comprehensive view of the causes which have prevented the advancement of therapeutics keeping pace with that made in other branches of medicine. It may, however, be said that the influence of all the other causes above mentioned sinks into insignificance when compared with that arising from our having never accurately studied the natural history of disease, with the object of having some criterion by which we might be able to gauge the efficacy of medicines and other remedies in the treatment of disease.

It is no exaggeration to say that owing to this great omission thousands, and tens of thousands, of clinical records that lie scattered through the columns of English and foreign medical journals are, from a therapeutical point of view, rendered perfectly worthless. Next to this hindrance to therapeutical progress must be mentioned the prevailing looseness in therapeutical investigations, and the want of accuracy in recording their results. The

Digitized by Google

reader may think that Dr. Clark used rather strong language when he spoke of "a few crude and ill-digested experiments upon animals supplemented by some equally crude and undigested observations on man, tricked out in the phraseology of science," &c. But severe as his animadversions were, they were just, and such as the experimental enquirer might profitably bear in mind. There is great charm in performing a few experiments, the very thought of earning a reputation for "original work," and being dubbed a practical scientist, inducing us to draw hasty and illogical conclusions from insufficient data, or from a few ill-devised or imperfectly performed experiments. Not that Dr. Clark underrates the value of experimental enquiry. On the contrary, as far as therapeutics are concerned, he rather overrates it. He says "that it is to experiments upon animals, aided by chemistry and physiology, that we shall have to look hereafter for our most substantial additions to the knowledge of the treatment of disease." We cannot conceive on what grounds such a statement could be made. If we may judge from the past history of medicine, and the actual gains in therapeutics obtained by experimenting upon animals, we cannot be very sanguine as to the future results of this method of investigation. Our knowledge of the therapeutic efficacy of nearly all our most approved drugs has been the result of accident, or of ordinary clinical experiment and empirical observation. In this way medical men became acquainted with the medicinal virtues of cinchona, antimony, mercury, opium, and many other equally valuable drugs. Of course, chemistry will continue to contribute, as it has done lately, many valuable additions to our materia medica; but it will be impossible to gauge their real efficacy in the treatment of disease by administering them first to healthy animals. The very fact—to which Dr. Clark himself calls attention—that the physiological effects of drugs upon the healthy textures of animals are by no means identical with those observed in diseased human beings, should prevent us placing too much reliance upon this method of advancing the science of therapeutics. This mode of inquiry can be at best only tentative. It will give much information respecting the poisonous or non-poisonous nature of an unknown drug, and point to that part of the human system on which the drug will probably be found to act; but that it will hereafter make "our most substantial additions to the knowledge of the treatment of disease," we cannot for a moment admit. Nor can we refrain from noticing an error of omission which runs through the whole of Dr. Clark's remarks on this important subject. He seems to imply that our efforts to advance the art of therapeutics, and to place it on a firmer and more scientific basis than that on which it at present rests, should be chiefly directed to the physiological and therapeutical action of drugs, as if the medicinal treatment was the most important part of practical medicine. It would be easy to show that the testing of drugs upon the lower animals will form but a small part of the work of the future investigator for this simple reason, that the medical prescription forms but a small part of the advice of the rational practitioner. The biologist, and even the horticulturist, have long shown us how much may be done by changing the environment or the hygienic conditions under which a plant or an animal lives; but this principle has not perhaps influenced the practice of medicine so much as it ought to have done, and hence we see hydropathists and other empirics taking possession of a field the cultivation of which by the rational therapeutist might have yielded abundant fruit. Whoever would rescue the science of therapeutics from the very low position it holds among other sciences, must not only study the natural history of disease, but before resorting to the use of drugs, obtain more exact data than we now have respecting the influence which change of air, exercise, habits of life, baths, diet, and other hygienic conditions, exert upon the progress and termination of a disease.

Notes on Current Topics.

Drug Smoking in Asthma.

Some time ago we drew the reader's attention to a very suggestive paper in the *Practitioner* by Dr. Reginald E. Thompson, on the "Therapeutical Value of Drug Smoking." In the current number of that journal Dr. Thompson has a few remarks on the application of this method of giving drugs to the treatment of asthma. Remedies for asthma are supplied in three forms: a powder which is burnt and the fumes of which are inhaled, cigarettes composed of tobacco combined with various drugs, or of paper dipped in a solution of the drugs. The best method of preparing drugs for the powder form is that: "The leaves of the vegetable used should be procured in good condition and perfectly fresh. They should then be soaked in a solution of nitre (25 per cent.), and the leaves then dried by gentle heat and powdered." In this way (fumigation) opium and stramonium may often be of great service. Good results were also obtained from nine grains of stramonium and one grain of cannabis indica, this being a quantity which will cover a shilling, sufficient for one fumigation. But if the patient does not object to smoking, Dr. Thompson much prefers to administer the remedies in the form described in his previous paper, namely, cigarettes impregnated with tinctures, so that the dose may be accurately apportioned. Thus for a sheet of Swedish paper sufficient to make 64 cigarettes, the following formula is given:—Tinct. tabaci, ʒx; t. conii, ʒij; t. lobelia, ʒij; t. cannabis ind., ℥xxxij; ext. opii, gr. j; ext. stramonium, gr. ij; olei anisi, ℥viij; potas. nit., gr. xvj; sp. v.r., ad ʒijss. Those who would like to try these cigarettes can get samples of them by applying to the firm of Messrs. Strickland & Rowe, Cromwell Place, South Kensington.

Formula for Podophyllin.

As most of us have felt the inconvenience arising from giving this drug in the ordinary form of pill with colocynth, rhubarb, henbane, &c., we shall not hesitate to note the following formula, which has appeared in several of our contemporaries. It is that adopted by Dr. Dobell, who states that from a very long and extensive experience he can confidently affirm that none of the accidents and inconveniences which so commonly attend the administra-

Digitized by Google

tion of podophyllin ever arise when this drug is prescribed according to his method. On the contrary, it is one of he most satisfactory and reliable of our medicines. The formula given is :—

℞. Podophylli, gr. ij.; essent. zingiberis, ʒij.; spiritus vini rect., ad ʒij. Fiat guttæ. A teaspoonful to be taken in a wine-glassful of water every night at bedtime, or every second, third, or fourth night as required.

Some practitioners do not take the trouble to inspect or inquire about the nature of the stools after ordering aperient medicines, but those who do will find that, in the case of many patients, podophyllin, combined with some corrigent, produces a copious, natural-looking, and consistent evacuation of the bowels, acting gently upon the liver, without causing any griping, liquid discharges, or tenesmus.

Rupture of the Spleen.

In a recent issue of the New York *Medical Journal* there is a case of rupture of the spleen which occurred in the practice of Dr. C. G. Hubbard, of Hornellsville, N.Y. Soon after the completion of a natural labour in a woman who had previously presented signs of an enlargement of the spleen, Dr. Hubbard was called in haste to her at 8 p.m., when he found her dead. Upon opening the abdomen all the organs were found in a healthy state, except the spleen. This was of normal colour, shape, and consistence, but it was ten inches in length, six inches in breadth, three inches in thickness, and weighed just four pounds. Two inches from its lower end, on its anterior surface, was a fissure, semi-lunar in shape, and extending nearly transversely across it. The fissure was six inches long, one-fourth inch in width, with ragged edges, and evidently had recently been made. Surrounding the spleen as it lay in position was more than a litre of clots of blood. From the cavity of the abdomen was taken over eighty ounces of blood. The cause of death was patent to all present, but at what time the rupture occurred was more difficult to determine. It appeared to be subsequent to the completion of labour, and but a short time previous to death. Dr. Hubbard states that Simpson cites three cases of rupture of this organ in connection with pregnancy.

Mr. Savory's Criticism of Professor Tyndall's Logic.

The strictures which Mr. S. Savory recently passed upon some observations made by Professor Tyndall in the November number of the *Fortnightly Review* for 1876, justly show how carelessly, even eminent scientists, will weigh the value of evidence when their judgment is warped by prejudice and preconceived opinion, or when they have some "framework of theory into which they press their facts." Because a wound in his foot, after the infliction of which he had walked about all day, was followed by an abscess in the neighbourhood of this injury, he hastily assumes that the abscess was owing to the germs of bacteria having got into the "incautiously opened wound." When, after a few days rest, the wound was uncovered, it was found "perfectly clean, uninflamed, and entirely free from matter," and no doubt had the Professor not walked about all day, it would soon, as in the case of thousands of other wounds of a like nature, have got quite well. "If," said Mr. Savory, "there be any difficulty in explaining the facts here set forth, surgery has assuredly long been under a strange delusion regarding the influence of rest, and motion, and position on the progress of wounds. . . . But Dr. Tyndall, throughout all his trouble, can see no agency at work but the germs." The question, moreover, was not so much a question of surgery, but rather one on the nature of evidence, and it was the more remarkable that this eminent savant should have fallen into this error, considering that in this same article in which he had been accounting for the serious results of his accident, he states "that while against unsound logic a healthy mind can always defend itself, against unsound experiment without discipline it is defenceless." But in this case the writer's mind was not in its usual "healthy state." His judgment was warped, and his inferences made fallacious by one of those "idols of the den," which Bacon has so well described in the first book of "Novum Organum." As a writer has observed, "the inference to be drawn from the fifty-fourth aphorism of that book is to suspect that kind of evidence which is most consonant to our inclinations, and not to admit any notion as real, except we can base it firmly upon that kind of demonstration which is peculiar to the subject, not to our impression." Professor Tyndall was under the spell of a "preconceived fancy" which made him "wrest and corrupt" the nature of the evidence before him respecting the cause of the abscess in his foot, as well as his "contemplations of a universal nature" regarding the germinal origin of abscesses in general.

Prolapsus Uteri.

La France Médicale gives the following description of the treatment of this disease, which it alleges has proved most successful. We arm ourselves with pure tannic acid, and ourselves make a *concentrated* solution of it in water, *at the moment of using it.* A score of little balls of charpie are made, and are allowed to soak thoroughly in the solution. A brush (camel's hair), with a long handle, is to be in readiness. The woman being in a suitable position, a speculum is introduced into the vagina which reduces the uterus, or the reduction may be effected before its introduction. The brush is then dipped in the tannic acid solution, and being carried through the speculum, the uterine neck and the whole internal surface of the vagina is several times freely bathed, the speculum being withdrawn little by little, but re-introduced afterwards to pack the balls of charpie soaked in tannin in the uterine culs-de-sac, by means of a long pair of dressing forceps. The culs-de-sac are thus firmly packed, and the speculum being gradually withdrawn, the whole cavity of the vaginal canal is filled with these same balls, and the vulva is closed by a charpie tampon, which is externally supported by a compress. Complete rest in bed is observed, and twenty-four hours after its application the charpie is gently withdrawn, pellet by pellet. Cold vaginal injections, composed of a strong decoction of dried oak bark, are then prescribed, to be used three times a-day. Before each of these injections the womb should be restored to position. At the end of two or three days

Digitized by Google

at most this operation is repeated, and so on, increasing little by little the intervals between the applications of the dressings; and even after it is thought that a cure has been obtained, the injections alone should be continued for fifteen days or so.

The proceeding is very simple, inexpensive, applicable at all times and in all places, necessitating neither special apparatus nor substances difficult to procure, nor traumatism of the genital organs; it is entirely painless, very easy of application, even for the most inexperienced physician, and secures at the end of some months an absolute and veritable cure of uterine prolapse.

Irish Vaccination and Offences against the Law.

In Ireland, as we learn from the report of the Irish Local Government Board, there was last year an increase in the total number of cases vaccinated and re-vaccinated in all Ireland of 15,366 cases. There were 140,469 births registered in the year 1876, 139,659 in the year 1877, and 134,370 in the year 1878. The number of children vaccinated yearly in those years, and coming under the provisions of the Compulsory Vaccination Act, are returned as 112,489, 115,190, and 122,015 respectively, showing a decrease in the number of births, but an increase in the number of children vaccinated, and, therefore, a more satisfactory compliance with the provisions of the Compulsory Vaccination Act. With respect to defaulters under the Compulsory Vaccination Act, a return has been prepared showing the numbers of defaulters returned in the whole of Ireland for the half-year, ended the 30th June, 1878, The total results arrived at are as follows:—

No.	of defaulters returned	16,489
„	found vaccinated	11,230
„	not found at addresses, dead, or left district	2,341
„	found still unvaccinated	2,918
„	unfit	1,148

A Satire on Medical Witnesses.

At the recent annual meeting of the Kansas State Medical Society the Committee chose a lawyer to move the address of welcome, and witness from the following extracts how he requited them for the honor conferred on him:

He said there are many cases determined in our courts involving nice questions of medical jurisprudence, whose elucidation requires the learning, the skill and experience of the physician, and the lawyer who is most active in securing the services of the largest number of medical gentlemen to espouse his cause is generally successful in gaining the victory. It may be a case in which an unfortunate defendant is accused of having taken the life of a human being, and ordinarily, for such an innovation upon the rights of man, he ought to be punished; but when we take into consideration the fact that he might have committed the act in a moment of emotional insanity—which, generally, can only be shown by the testimony of gentlemen of your profession—we at once understand the obligation of the lawyer who has successfully established the innocence of his client through the skill of witnesses whose experience in life has unfolded to them, and them alone, the hidden mysteries of the mind. It may be a case in which a plaintiff claims that some railroad corporation, through negligence, has cause his limbs to be broken, his body crushed, his heart displaced, and his flesh lacerated and wounded. The lawyer for the plaintiff can generally show that the injuries of his client are lasting, permanent and agonising in the extreme; while that of the defendant will experience no difficulty in almost demonstrating the fact that the displacement of the heart will produce freer action of that organ of the human system; that the injury may be functional or it may be organic—in either event beneficial; that the broken arm is stronger than before; that the fractured clavicle lends more power to the acromion process; that a broken spine aids and accelerates locomotion; and that a lesion of the spinal cord awakens the hitherto dormant faculties of the brain; and, in fact, that the plaintiff has been improved upon by the accident.

Instruction in Swimming.

We are glad to see that the London Swimming Club, 14 Finsbury Square, are still doing all they can to encourage people to learn the art of swimming. Mr. J. Garrat, hon. sec. to the Club, writing to one of the daily papers, says:—"Why every moderate-sized boarding school is without a plunge bath I cannot understand. In the winter season it could be used as a covered playground or lecture room. If this expense is too much, a 'tuition tank' could be erected for about £50, in which every child could be taught in the routine of the school, as it does not require a champion to impart this knowledge. The City is sadly deficient of baths, which deficiency we are trying to remedy by a scheme to build one in Finsbury Square, as well as eight others in different parts. We are compelled to do this, having signally failed to persuade the City authorities to do so, although we have laid plans well matured before them for this purpose. Therefore, all those who will aid us can have the particulars at this address. We shall continue to give gratuitous tuition to all sending me a stamped and directed envelope, or advise those who can afford to pay for tuition."

We have on more than one occasion dwelt upon the hygienic as well as the social advantages that would result from every one of both sexes learning this useful and healthy exercise. The great scarcity of good baths in London is certainly a disgrace to a rich and civilised country like England. We may remind Mr. Garrat that a new and abundant supply of water for the metropolis is in contemplation; and when this great project is realised, that will be the time for agitating in favour of establishing a system of public baths on a scale commensurate with the importance of the subject, and the size and population of this great city.

A disgusting case of milk adulteration was heard at Newport, Cardiff, last week. It was proved that a milk-seller, named Merchant, was in the habit of largely diluting his milk with water from a brook into which a water-closet emptied itself, and near a bank which was a manure-heap. The man was fined £20.

Postponement of the Army Medical Examination.

As we foretold a fortnight since, the War Office authorities have found it wise to postpone (!) the examination for the British Medical Service which had been advertised for this month. It is "postponed to the end of September." The fact is that the postponement was forced upon the Department by the absolute refusal of the profession to have anything to say to the Service until their bargain with the authorities was actually published. A previous experience of the reliability of War Office promises induced a marked shyness of students towards the Service until they had something more in the way of a guarantee than promises of a warrant. It remains to be seen whether the coming warrant—when it arrives—will make matters any better. Judging from the habitual attitude of the combatant organisation towards the medical officers it may reasonably be assumed that "the doctors" will get as little as possible, and as grudgingly as possible; and that a steady effort will be made to nullify any concessions which the Warrant may make, and to throw every difficulty in the way of a more satisfactory Army Medical Service.

Lord O'Hagan's Neglected Lunatics (Ireland) Bill.

A Bill, introduced by Lord O'Hagan into the House of Lords, extends to Ireland the provisions of English law relating to neglected lunatics. The Bill commences by extending to Ireland the provisions of English law relating to pauper lunatics, their visitation, and confinement. It gives jurisdiction to the judge of a Civil Bills Court over the persons and property of lunatics whose property is so small as to be entitled to exemption from fees and percentages under the Irish Lunacy Regulation Act of 1871. Another provision authorises the guardians to relieve a poor person, either in the workhouse or out of it, where his destitution is caused by his being temporarily disabled by reason of mental defect, or the mental infirmity of any one dependent on him for support. Moreover, the Bill empowers the governors of Irish district lunatic asylums to board out a lunatic with any private person, upon the latter undertaking that the lunatic shall be properly taken care of, and shall be prevented from doing injury to himself or to others. Every lunatic so boarded out is to be subject to the periodical inspection of the medical officer of the dispensary districts.

The Botanical Prizes for Ladies in the London Apothecaries' Hall.

The competition for prizes offered by the Society of Apothecaries to young women for proficiency in botanical science took place at the hall in Blackfriars, on Wednesday, June 18. At the first meeting twenty-seven young women attended, most of whom were educated in London: all were under twenty years of age. The examination occupied four hours. The result was pronounced by the examiner very satisfactory. The final competition was held at the Society's garden at Chelsea, when nineteen candidates attended, and were examined in writing and in microscopic demonstration. The papers written on these subjects were, as before, of great merit. Certificates and the prizes were finally awarded as follows:—The Society's Gold Medal to Miss Whittaker, aged nineteen, Whiteland's College, Chelsea; and the Silver Medal to Miss Klaassen, aged eighteen, of Croydon.

An Anomalous Monstrosity.

Dr. Plant recently reported in the *Obstetric Gazette* a rather singular monstrosity. The history of the case revealed nothing unusual in the labour. The fœtus seemed to terminate at the pelvis in a large, fleshy mass attached to the buttocks. No umbilical cord, no vestige of connection of the monstrosity with the uterus could be observed. There were some feeble efforts at respiration, but these were not encouraged. An investigation revealed the fact that the fœtus was doubled up in the usual antenatal fashion, and that it was enveloped by the secundines, the fleshy mass at the buttocks being the placenta. When the membranes were skinned off a perfectly formed male child was shelled out.

The Medical Schools.

The Medical Schools of the metropolis will open on the 1st October. At St. Thomas's an introductory address will be delivered by Dr. Robert Cory; at the Middlesex by Dr. Sidney Coupland; at the Charing Cross by Mr. Francis Hird, F.R.C.S. Eng., the Dean of the School; at St. Mary's by Mr. St. George Mivart, F.R.S.; at the Westminster by Dr. Dupré, F.R.S., the lecturer on chemistry and toxicology; at St. George's by Dr. William Bartlett Dalby, aural surgeon to the hospital; at University College by Professor George D. Thane; and at King's College by Professor Alfred Baynard Duffin, M.D. At St. Bartholomew's and Guy's no addresses will be delivered.

Camphor as a Hypnotic.

The *Jour. de Med. de Bordeaux* says that Wittich has repeatedly administered camphor to relieve the insomnia which accompanies certain forms of mania, hysterical insanity, and hypochondria. He has found that under such conditions camphor acts much better than chloral, morphine, or bromide of potassium. He administers it by hypodermic injection. He dissolves it in olive oil, and the dose which he recommends is from one to one and a quarter grains. Small doses are more certain to produce sleep than large doses. The sedative effect, as a rule, appears rapidly, and the sleep produced lasts several hours. The injection is to be repeated when the restlessness reappears.

Locomotion for Medical Students.

The *Union Medicale* says that the Paris Faculty of Medicine has adopted a measure likely to be followed by other teaching bodies—viz., the issuing gratuitously every day to students a certain number of tickets for tramways and omnibus, which are only available between the hours of ten and twelve. This is done in consequence o the difficulty which many students find in attending the clinics at the different hospitals, owing to the distances which have to be traversed within a short period of time.

Two Prize Essays.

The German Empress has offered a prize of 2,000 marks (£100) for the best essay on Diphtheria. The conditions are, that the writer is to bring forward important new facts as to the essential nature of the disease, especially with regard to the infectious matter which propagates it, its dissemination, and the means for arresting its progress. The essays may be written in German, English, or French, and must be sent to Prof. v. Langenbeck, Berlin, N.W., 3 Roonstrasse, on or before December 15, 1880.

The Pharmaceutical College of Madrid offers a prize of 5,000 reals (£50) to the author of the best memoir on the following subject :—

On a septic poison, with explanation of the method of isolation, and the experimental studies by which this is attained ; with a demonstration of its nature, composition, properties and characteristics. A specimen of the poison is to accompany the monograph.

A Hindoo Medical School.

An appeal has been made by a Calcutta Baboo for a sum of 22,000 rupees wherewith to found a "free Ayur Veda College for the education of Hindoo physicians.' The prospectus states "that in India, treatment according to the Hindoo system of medicine, is generally more efficacious than that according to a foreign one. As our bodies are formed of and nourished by Indian materials, it would be against nature if medicines brought from foreign countries suit our constitution in time of illness."

American Ophthalmological Society.

This Society held its regular session this year at Newport, R. I., commencing July 24th. The following officers were elected for the ensuing year :—President, H. D. Noyes, of New York ; Vice-President, W. F. Norris, of Philadelphia ; Secretary and Treasurer, Dr. R. H. Derby, of Boston ; Corresponding Secretary, J. S. Pronte, of Brookline ; Publication Commissioners, E. G. Loring and D. B. St. John Roosa, both of New York. It was voted to hold the next annual meeting in Newport.

The death is announced of Sir Thomas Maclear, late Astronomer Royal at the Cape of Good Hope.

Sir Thomas was the eldest son of Mr. James Maclear, of Newtownstewart, co. Tyrone. He entered the medical profession before turning his attention to astronomy. He began his medical studies in Newtownstewart, under Dr. Rodgers. At the age of sixteen years he left Newtownstewart, and completed his studies in England. Having obtained his diploma he became assistant to his uncle, where he remained for many years. He then turned his attention to astronomy, in which he was encouraged by his wife, and afterwards got appointed to the Royal Observatory at Cape Town.

On Monday next an Act to amend the Poor Laws will take effect. By the statute, among other things, power is given to the Metropolitan Asylums Board to contract with any local authority in the metropolis for the reception and maintenance in any hospital belonging to the Board of any person suffering from any dangerous infectious disorder.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

Death-Rate of Glasgow.—The deaths in Glasgow for the week ending the 16th inst., show the lowest rate ever recorded for one week, being at the rate of 15 per 1,000 per annum, against 16 in the preceding week, and 21, 22, and 22 in the corresponding periods 1878, 1877, and 1876.

Dr. Russell's Report.—Dr. Russell, medical officer of health for Glasgow, reported that during the fortnight ending 9th August there were 339 deaths registered, as compared with 381 in the fortnight preceding, being a decrease of 49, representing a death-rate of 16 in place of 17 per 1,000 living. The number of deaths from pulmonary diseases was 103 in place of 109, representing a death-rate of 5 per 1,000, and constituting 30 per cent., in place of 28 per cent. of the total deaths. The number of deaths from fever was 6 in place of 8, viz., 2 from typhus and 4 from enteric fever. The general vital figures were—low pulmonary mortality, the entire absence of fatal diarrhœa, and of infectious diseases in the epidemic form.

Glasgow Lying-in Hospital.—The directors of this somewhat unfortunate institution have resolved upon closing it for some time, owing to another outbreak of puerperal fever. What has become of the vaunted *cures* of puerperal septicæmia at this hospital? Were they mistakes of diagnosis or what?

Glasgow Convalescent Home, Lenzie.—This home is at present full, and has been so during the year. Upwards of 900 patients have been treated since 1st January last, and a large number wait admission. This Home is in connection with the Royal and Western infirmaries, and great demands have been made for admission to the Home by patients from these institutions, as well as from the general public.

The Edinburgh Police and the Royal Infirmary.—The Lord Provost has received, through Mr. Henderson, Superintendent of Police, a cheque for £22 10s., contributed towards the funds of the Edinburgh Royal Infirmary, by the "superintendent, officers, and constables of the City Police Force." The whole force subscribed most willingly.

Registrar-General's Returns.—The weekly return of births, deaths, and marriages in the eight principal towns of Scotland for the week ending Saturday, August 16th, says : The death-rate in the eight principal towns during the week ending with Saturday, the 16th August, 1879, was 15·3 per 1,000 of estimated population. This rate is 5·1 under that for the corresponding week of last year, and 1·3 below that for the previous week of the present year. The lowest mortality was recorded in Greenock, viz., 12·2, and the highest in Perth, viz., 19·5. The mortality from the seven most familiar zymotic diseases was exactly the same as during the previous week, viz., 1·8 per 1,000. Whooping-cough and diarrhœa were the most prevalent, causing 13 deaths each. Acute diseases of the chest caused 58 deaths, being nearly the same number as in the previous week.

Correspondence.

THE ARMY MEDICAL SERVICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Permit me, on my own behalf and on that of a great majority of my fellow-students in the various London hospitals, to endorse most fully your judicious remarks

Digitized by Google

upon the Army Medical Service. A great number of us would only be too glad to enter the service if we thought we should be fairly treated. A great grievance among us, I find, is the new system of the Army Medical Corps. In the old system medical officers, being attached to their various regiments, became more or less incorporated with them, and a strong *esprit de corps* pervaded between the surgeons and the military officers and privates; by this new system. this laudable and necessary spirit naturally collapses, as by frequent change the medical and military men are never permitted to remain long enough together to form any strong reciprocation of friendship; besides, if it were only for the discipline of the regiment, I should imagine everything would be more in unison if all parties were in harmony, and united by the bond of "auld lang syne."

Believe me, Sir,

Yours very truly,

MED. STUDENT.

Charing Cross Hospital.

REACTIONARY BLEEDING.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Reactionary bleeding is a well-known and frequent source of trouble after amputation of the penis. Having experienced this once, an idea suggested itself which was put into practice in the following case, my friend Dr. Stoney assisting:—

M. F., æt. 40, a very powerful man, presented himself, suffering from cancer of the penis of about twelve months, duration, and involving so large a portion of the member as to require amputation very close to the pubes.

The diseased mass having been removed, three vessels tied, and the urethra treated in the usual manner, a needle was passed from side to side through the skin and behind the urethra; round the projecting ends of this a narrow tape was twisted, so as to embrace and compress the corpora cavernosa. Next morning the needle was removed.

In this case, owing to the comparative youth of the patient, his great physical power, and the removal of the organ so near its base, reactionary bleeding might have been expected. None, however, occurred, and M. F. made a good recovery.

Not having seen this plan mentioned, it struck me its publication might prove useful.

Very truly yours,

Abbeyleix, Aug. 19, 1879. THOS. SWAN.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

J. C. WEBSTER.—Thanks for your communication, but we think it is scarcely fit for publication in our columns.

F.R.C.S.—The book you refer to has been long out of print, but you might be able to see it by applying either to a second-hand medical bookseller, or to the librarian of one of our large medical libraries, such as that of the Royal Medical and Chirurgical Society, the Medical Society of London, or of the College of Physicians.

DR. OGSTON will please receive our thanks.

DR. COLLARD.—With pleasure.

CURIOSUS.—The publication of the translation you sent was unavoidably postponed, but will now shortly appear in our columns.

F. C.—A review of the book is in the hands of the printer, and from that you will be able to judge whether it will suit your purpose.

F.R.C.S.ED.—The subject has already received attention.

MR. GREEN.—We should advise you to take no notice of the circular. It is in itself sufficient to condemn the man who wrote it.

DR. G. H. T.—Decidedly not.

CHAS. H. S.—The information required will be given in our next Students' Number.

B.Sc.—Next week.

VACANCIES.

Alnwick Infirmary.—House Surgeon. Salary, £120, with furnished apartments, attendance, &c. Applications to the Hon. Sec. by Sept. 27.

Bantry Union, Glengarriff Dispensary.—Medical Officer. Salary, £90 with fees, and £10 as Medical Officer of Health. Election, Aug. 29.

Dreadnought Seamen's Hospital, Greenwich.—House Physician and House Surgeon. Salary, of the former, £76, of the latter, £50, with board, apartments, and attendance. Applications to the Secretary on or before Sept. 10.

East London Hospital for Children.—Resident Clinical Assistant. Board, but no salary. Applications to the Secretary on or before Sept. 8. (See Advt.)

Hampstead, Parish of St. John.—Medical Officer of Health. Salary, £125. Applications to the Vestry Clerk endorsed "Medical Officer of Health," before Sept. 1.

Hospital for Diseases of the Throat and Chest, Golden Square.—Physician. Applications to the Secretary on or before Sept. 1.

Leeds Union.—Medical Superintendent. Salary, £300, with an unfurnished house. Applications to be sent to the Clerk of the Guardians, East Parade, Leeds.

London Fever Hospital.—Resident Medical Officer. Salary, £200. Applications to the Secretary, Liverpool Road, Islington, before Sept. 6.

Nottingham General Hospital.—House Surgeon. Salary, £80, with board, &c. Applications to the Secretary before Sept. 1.

Queen Charlotte's Lying-in Hospital.—Resident Medical Officer. Salary, £60, with board. Applications to the Secretary 191 Marylebone Road, London, W., on or before Sept. 1.

Ramsgate Seaman's Infirmary.—Resident Medical Officer. Salary, £130. Applications to the Secretary on or before Aug. 30.

Royal Hants County Hospital.—House Surgeon and Secretary. Salary, £109, with board and lodging. Applications to be addressed to the Committee, under cover to the Secretary, before Sept. 10.

Westminster Hospital.—Pathologist and Curator of Museum. Salary, £52. Applications to the Secretary on or before Sept. 13.

APPOINTMENTS.

BARLING, G. H., M.R.C.S.E., Clinical Assistant to St. Luke's Hospital for Lunatics.

COX, LI., M.R.C.S.E., Assistant Medical Officer to the Wiltshire Lunatic Asylum, Devizes.

CURTIN, P., L.K.Q.C.P.I., L.R.C.S.I., Medical Officer, Medical Officer of Health, &c., for the Clane and Timahoe Dispensary District of the Naas Union.

DAVISON, S., M.D., Certifying Factory Surgeon, for the District of Dromara, co. Down.

DAVY, H., M.B., House Surgeon to the Evelina Hospital for Sick Children.

GARBUTT, J. G., M.A., M.R.C.S., L.S.A., Assistant House Surgeon to the Female Department of the London Lock Hospital.

HALTON, R. J., L.K.Q.C.P.I. & L.M., L.R.C.P.Ed., Certifying Factory Surgeon for the District of Kells, co. Meath.

LAWTON, J. W., M.R.C.S.E., House Physician to the London Hospital.

LENDON, E. H., M.B., Obstetric Physician to the St. Marylebone General Dispensary.

LUBBOCK, M., M.B., L.R.C.P.L., a Physician to the St. Marylebone General Dispensary.

MACARTNEY, T. L., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer to Court Kynaston of the Ancient Order of Foresters, Worthen.

MARTIN, T. M., M.D., Medical Officer to the Piltown Dispensary, Carrick-on-Suir Union.

IRISH POOR-LAW INTELLIGENCE.

SANITARY ORDERS UNDER THE PUBLIC HEALTH (IRELAND) ACT.

THIS important order has been issued by the Local Government Board within the last week.

To the Guardians of each of the Unions named in the Schedule A to this Order annexed (or other Sanitary Authority); to the Medical Officers of the Workhouse and of the Dispensary Districts therein (or of the Sanitary Authority); to the Clerk and other paid Officers thereof; and to all whom it may concern:

Whereas by the "Public Health (Ireland) Act, 1878," each of the said unions has been constituted a rural sanitary district, and the guardians of the union have been, as such, declared to be the rural sanitary authority.

And whereas by the eleventh section of the said Act it is enacted that every medical officer of a dispensary district shall be a sanitary officer for such district, or for such part thereof as he shall personally be in charge of, under the title of medical officer of health, and that every sanitary authority shall appoint in addition such other sanitary officers, including a medical superintendent officer of health when deemed necessary, as the Local Government Board shall in each case direct:

And whereas by the said eleventh section it is further provided that the Local Government Board shall assign to the medical officers of health, and to the other sanitary officers, if any, and to the medical superintendent officer of health, if such an officer be appointed for the sanitary district, their respective duties and functions in the discovery, or inspection, or removal of nuisances, in the supply of pure water, in the making or repairing of sewers and drains, or in generally aiding the administration of the sanitary laws within the district:

And whereas by the said eleventh section it is further provided that the Local Government Board shall have the same powers with regard to the qualification, appointment, duties, regulation of salary, and tenure of office of every sanitary officer as they have in the case of the medical officer of a dispensary district:

Now, we, the Local Government Board for Ireland, do hereby order and direct, with respect to each of the unions named in the said schedule as follows:—

Appointment of Sanitary Officers, and Tenure of Office.

1. The sanitary authority shall appoint so many sanitary sub-officers as the sanitary authority shall, with the consent of the Local Government Board, determine; and the relieving officers of the union and the collectors of poor rates shall be alike eligible for the office of sanitary sub-officer, or any other person who may be approved by the Local Government Board.

2. The sanitary authority shall, when directed by the Local Government Board, appoint one consulting sanitary officer, or one medical superintendent officer of health, and for either of the offices every medical officer of the union, including workhouse medical officer or officers, and also, subject to the approval of the Local Government Board, any other duly qualified medical practitioner; and the sanitary authority shall also appoint an executive sanitary officer, for which office the clerk of the union, or any assistant of the clerk appointed by the guardians, shall be eligible, or any other person who may be approved by the Local Government Board.

3. Every officer appointed by the sanitary authority shall continue to hold office for such period as the sanitary authority may, with the approval of the Local Government Board, determine, or until he die, or resign, or be removed by such sanitary authority, with the assent of the Local Government Board, or by the Local Government Board; and the sanitary authority shall, upon the occurrence of any vacancy in any of the offices herein mentioned, cause the same to be reported to the Local Government Board, and shall, unless otherwise directed by the said Board, proceed to a new appointment.

4. All consents, approvals, assents, directions, and requisitions of the Local Government Board touching the appointment of sanitary officers, and their tenure of office, shall be signified by the Local Government Board to the sanitary authority by letter, and need not be embodied in any order under the seal of the Board.

Duties of Medical Officers of Health, and other Sanitary Officers.

1. Every sanitary sub-officer shall, by inspection of the district for which he is appointed, keep himself informed in respect of any nuisances existing therein that require abatement under the Sanitary Acts, and if he shall receive notice of the existence of any nuisance within the district, he shall, as soon as practicable, visit the place and inquire into such alleged nuisance; and when he finds any matter demanding, in his opinion, attention from the medical officer of health of the dispensary district in which the same occurs, he shall notify it forthwith to the medical officer of health in writing, specifying the nature of the case, the situation of the premises, and the name of the occupier or owner, in the form (A) in the schedule B to this order annexed, and shall preserve a copy thereof in duplicate; and he shall submit to the sanitary authority at each weekly meeting, the duplicates of the reports which he has made to the medical officer of health during the preceding week, or an abstract thereof, and he shall also report to the sanitary authority any other matter affecting or threatening to affect injuriously the public health within his district.

2. Every medical officer of health who shall have been apprised officially by the sanitary sub-officer or shall otherwise become cognisant of any matter demanding his attention as aforesaid, shall, as soon as practicable, visit the place, and if, after due inspection, he finds such matter to involve danger to public health, he shall report thereon

Digitized by Google

to the sanitary authority, in the form (B) in the said schedule B, showing the source from which he received the information, and the date thereof, and the date of his visit of inspection; he shall also give a sufficient description of the nature of the case, and the remedy which he recommends to be adopted, and shall preserve a duplicate of every such report.

3. Every medical officer of health shall inform himself, as far as practicable, respecting all influences affecting or threatening to affect injuriously the public health within the district in his charge, and shall from time to time, as occasion may require, report on the subject to the sanitary authority, and recommend the measures which, in his opinion, should be adopted for the protection or improvement of the public health in such district.

4. Every consulting sanitary officer, if such an officer be appointed for the sanitary district, shall attend meetings of the sanitary authority, whenever required to do so, and shall advise them on all matters and proceedings requiring medical knowledge and advice in the administration of the sanitary laws.

5. Every medical superintendent officer of health, if such an officer be appointed for the sanitary district, shall discharge all the duties imposed by this order on the consulting sanitary officer, and in addition to such duties shall perform the following duties—that is to say, he shall report monthly to the sanitary authority on the general sanitary condition of the rural sanitary district, and on the discharge of their duties by the medical officers of health and sanitary sub-officers of the district.

6. Every executive sanitary officer shall attend the meetings of the sanitary authority, and shall take their directions from time to time on the sanitary business of the district, and on the reports of the sanitary officers, and all proceedings arising thereon, and shall, so far as may be requisite, give instructions for the prompt and correct execution of all such orders and directions, and report on such execution, or on any neglect or failure therein which may come to his knowledge.

7. Every medical officer of health and sanitary sub-officer of the union shall attend meetings of the sanitary authority, whenever required to do so, and shall assist in all proceedings in which his assistance may be required.

8. Every medical officer of health, and every other officer appointed under this order, shall, in matters not specifically provided for in this order, observe and execute the instructions of the Local Government Board and all the lawful orders and directions of the sanitary authority applicable to his office.

9. The proceedings of the sanitary authority shall be recorded by the executive sanitary officer, and a copy of such record shall be transmitted by him to the Local Government Board as soon after each meeting as practicable.

Statistics of Disease.

It shall be the duty of the medical officers of health, and of the consulting sanitary officer or medical superintendent officer of health, if such an officer be appointed to the sanitary district, to furnish to the Local Government Board such statistical returns of sickness and disease as shall from time to time be required from them respectively.

Orders No 2, 3, and 4 are identical with the above except that they are directed to urban authorities, whether recognised by the Public Health Act or erected by provisional order.

The fifth order applies to the city of Dublin, and differs in material respects from the others. We shall refer to it in our next.

PILTOWN DISPENSARY.

On Wednesday last the members of the committee met for the purpose of electing a medical officer, a vacancy having been caused by the death of Dr. O'Meara. Minutes read.

Mr. Lalor thought it well if there was some arrangement made with whatever doctor would be elected as to the payment of a *locum tenens*.

Mr. Walsh—What Mr. Lalor means is, whatever doctor is elected that he should give an undertaking to supplement anything that is required over two guineas a week to his *locum tenens*.

Mr. Lalor said, a doctor acting as *locum tenens* usually gets three guineas a week, which would make the salary given six guineas a week. He considered six guineas a week too much for any board to pay. Two guineas a week would be enough for them to allow a *locum tenens*, and anything more that would be required should be supplied by the doctor who gets leave of absence. Giving two guineas per week to the *locum tenens*, the entire salary would be five guineas a week. He considered he was right in moving that a resolution to that effect should be passed by the committee, and moved that their medical officer, when applying for leave of absence, be required to supplement anything required over two guineas a week to his substitute.

Passed unanimously.

THE APPLICATIONS.

The diplomas of Dr. George Hearne, Dungarvan, and Dr. Thomas Morgan Martin, of Portlaw, were now examined, and Dr. Hearne was called into the room and asked by Mr. Blackett whether he would, if elected, be satisfied to supplement anything over two guineas that would be required by his substitute whenever he got leave of absence?

Dr. Hearne—I am satisfied with that.

Dr. Martin being asked the same question answered in the affirmative.

On a poll being taken, the result stood as follows:—

For Dr. Martin—10.

For Dr. Hearne—8.

Dr. Martin having been called into the board-room, returned thanks.

[We beg to observe that no board of guardians has any power whatever to impose upon a candidate such a condition as that attempted to be imposed in this case. The regulations set forth the privileges and duties of medical officers, and no one can add anything thereto or take anything therefrom, and no pledge given by a candidate for the purpose of securing his election can be sanctioned by the Local Government Board, or have any validity. We think it a very objectionable practice for committeemen to exact such promises as the price of votes, and, if the practice is tolerated, there can be no limit to such dictation.—Ed. M. P. & C.]

WATERFORD UNION.

INFANTS IN WORKHOUSES.

Read the following letter from the Local Government Board:—

The Local Government Board have had before them the minutes of the 22nd inst., containing an entry of a report from Dr. Connolly, one of the medical officers of the workhouse, stating that, in accordance with the wishes of the guardians, he had removed the names of nine women from his books, who were not actually in attendance on the sick, and that he desires it to be understood that he cannot be in the same degree responsible for the infants as when those women had charge of them. In reference to this report, the Board have to state that so far as they were aware there was nothing in the order made by the guardians calculated to interfere with the responsibility of the medical officer. All that he was required to do was to carry out the workhouse rules, and any sick infants or infant can have such care and treatment as the medical officer thinks necessary, under Article

Digitized by Google

19 of the workhouse rules. The Board accordingly request the guardians to be good enough to inform Dr. Connolly that he cannot relieve himself of his responsibility as he suggests.

Ordered that the letter be communicated to Dr. Connolly.

CARRICKMACROSS UNION.

READ letter from Dr. M'Kenna, to the effect that while examining a lunatic he attacked the doctor and bit his right hand so severely that he was quite unable to do the duty of the dispensary.

The guardians ratified the appointment of Dr. Garland as *locum tenens*.

THE VACCINATION ACT.

At the last meeting it was stated that twenty-nine persons were ordered to be summoned under this Act some time previous, but that although the summonses were filled they could not be sent out for service as the Board named no person as complainant. Dr. M'Kenna declined to allow his name to be used, and the matter was allowed to stand over for a few days to take the directions of the guardians. In the meantime all the defaulters came in and complied with the terms of the Act but seven, and on the matter being explained at the last meeting, these seven were ordered to get a few days' more grace. It was now stated that they had all complied but two, but the guardians were now presented with the Petty Sessions Clerk's little bill for the spoiled stamps.

Mr. Campbell, R.O., said when he went to Dr. M'Kenna about the matter, he said he wouldn't prosecute, but he was quite willing to provet he cases.

The Chairman—Dr. M'Kenna was bound to prosecute. How were the prosecutions conducted formerly?

Mr. Campbell—The Board of Guardians were made complainants, but by an order recently made the guardians could not now appear except through an attorney. By using the name of one of their officials they could save the solicitor's costs to the poor people, and it was in order that the guardians might name the official to represent them that the delay was made.

DUNGARVAN UNION.

FEES FOR SANITARY PROSECUTIONS.

DR. FLYNN wrote for payment of two guineas, for attending at Ballymacarbery petty sessions, and prosecuting in a sanitary case at suit of the guardians.

Clerk—I believe he is entitled to a fee in a case he prosecutes. Whether the person convicted or the guardians are to pay him, I don't know.

Mr. Fitzgerald—Why, if Dr. Anthony charged for every case he had before the magistrates he'd have a long bill against us.

Mr. Quinlan—I'd simply refuse it. If we had to pay this it is not the fellow who caused the nuisance we would be punishing, but the ratepayers.—Refused payment.

[By sec. 258 of Public Health Act ("Irish Medical Directory," page 582), the medical officer is "entitled to remuneration from the sanitary authority at such rate as the Local Government Board shall approve."—ED. M. P. & C.

MOUNTMELICK UNION.

READ letter from Dr. Clarke asking for an extension of sick leave.

Mr. Peacock said that Dr. Rice had stated he would not undertake the charge of workhouse and dispensary again unless the board guaranteed him £5 5s. a week.

Mr. Rice was sent for.

Mr. Vanston—It is stated you will not continue to carry on Dr. Clarke's duties for £3 a week.

Dr. Rice said that was perfectly right. He was not going to attend to the workhouse for three hours a day, coming into contact with contagion in the fever hospital, to be liable to be called out of his bed any moment, and to be prevented from leaving the town, for 2s. 6½d. a day. He thought it was derogatory to his profession to ask him to undertake the charge of the workhouse at such a rate of remuneration.

At the request of Mr. Vanston, Dr. Clarke's letter was read for Dr. Rice.

Dr. Rice said he wished to do what was fair, but he would not demean himself by accepting 18s. 6d. a week for attending the workhouse.

Mr. Vanston quoted Article 43 of the Poor-Law Regulations, to show the powers of the board in cases like that under attention. The Article is as follows:—"If any officer, or assistant appointed to hold any office under this Order, be at any time prevented by sickness, or any other sufficient reason from performing his duties, the guardians may appoint a fit person to act as temporary substitute, and may, subject to the approval of the Commissioners, pay him a reasonable compensation for his service."

Dr. Rice remarked that he did not receive notice of the remuneration he was to be allowed until the Monday following the board day on which Dr. Clarke was granted leave, and it was then too late for him to decline to act.

Mr. Cobbe contended that Dr. Rice could not relinquish the duties of *locum tenens* without a week's notice. The resolution read two ways. It gave Dr. Clarke a month's leave, but it did not appoint Dr. Rice for any definite time.

Dr. Rice denied that the board could compel him to act longer than he wished. He was perfectly independent of the board. In answer to Mr. Clarke, he said he would continue to discharge the duties in connection with the dispensary and those connected with the workhouse for £4 4s. a week He would have done the duty for Dr. Clarke for nothing, only on the last board day some of them proposed to give him 18s. 6d. a week for taking charge of the workhouse, he believed with the object of slighting him. The custom was to give a *locum tenens* £3 3s. a week for taking charge of a dispensary, but here they only gave him £2 2s. a week.

Mr. Cobbe said Dr. Clarke was bound by the resolution of the last board to pay his substitute.

Proposed: "That we continue the leave asked for by Dr. Clarke for one week, and that we pay Dr. Rice the sum of £4 to perform his duties."

The Chairman said he could not see his way to put the resolution.

Mr. Cobbe—I will read what I have to propose: "That this board having given due notice to Dr. Clarke of the terms he would be expected to act on if he did not resume his duties, are, therefore, of opinion it would be pressing unduly on the ratepayers to depart from the resolution in these hard times (especially when we find the doctor has had more paid substitutes of late years than any other medical officer), and it would be unfair to impose any further expense on the said ratepayers. We, therefore, call the attention of the Local Government Board to the resolution passed on the subject."

Mr. Clarke—Dr. Rice has consented to act for £4 a week, and I suppose it rests between Dr. Clarke and himself.

Dr. Rice—Four guineas, if you please, to be paid by the board.

Mr. Vanston said the resolution of the last board was not binding, and read the following communication from the Local Government Board to the guardians to support his contention:—

"Local Government Board, Dublin,
9th May, 1879.

"Sir,—The Local Government Board for Ireland acknowledge the minutes of the proceedings of the board o guardians of the Mountmelick union of the 3rd inst.,

Digitized by Google

and with reference to the resolution that a substitute for a dispensary medical officer shall not under any circumstances be paid by the guardians, the Board desire to point out that such a resolution has no binding effect, nor can it fetter the action of the guardians at any subsequent meeting.—By order, "B. BANKS."

Mr. Cobbe said that this communication did not refer to the case before the board. They had agreed to pay Dr. Clarke's substitute for one month, and they had notified that they would not pay the substitute any longer.

Dr. Rice asked what about the dispensary.

Mr. Vanston replied that the dispensary committee would settle that.

Dr. Rice replied that he did not understand that. The option of paying him lay with the board of guardians. If he were wanted to do his duties in connection with the dispensary after twelve o'clock that night, he would charge £2 2s. for every night visit, and £1 for every ordinary night.

Mr. Vanston's resolution carried unanimously.

Dr. Rice—I accept the workhouse; but the dispensary is an open question.

Several of the guardians present having assured Dr. Rice they would support the proposition that the *locum tenens* discharging the duty of the dispensary should be paid £2 2s. a week, whenever the matter might come before the board, Dr. Rice said he would consent to do the dispensary duties.

QUARTERLY RETURN OF BIRTHS & DEATHS IN IRELAND FOR THE QUARTER ENDING JUNE 30, 1879.

(Continued.)

Measles.—The mortality from this disease was again below the average, the deaths numbering only 183, viz.—74 in the province of Leinster, 47 in Munster, 49 in Ulster, and 13 in Connaught. Of the 74 deaths from this cause in Leinster, 60 occurred in the two Dublin Unions, and of the 47 deaths in Munster, 46 were in the county of Cork, including 18 in Bandon Union, 9 in Bantry Union, and 15 in the Clonakilty Union; 10 of the deaths in the last-named union were in the Timoleague District, where the deaths from all other causes under 60 years of age numbered only 11. Eleven deaths from measles were registered in Inishowen Union, county Donegal.

Scarlet Fever.—Deaths from scarlet fever were about one-fourth less than in either of the two preceding quarters and although much more numerous than in the second quarter of last year or of the year 1877, they compare very favourably with the average mortality from this cause in the June quarter of the last ten years. They amount to 307, of which 113 were in the province of Leinster, 49 in Munster, 115 in Ulster, and 30 in Connaught.

Fever.—The deaths from fever were about the average for the June quarter. In proportion to population the mortality was highest in Munster and lowest in Ulster. The total number of deaths was 774, of which 262 occurred in the province of Munster, 205 in Leinster, 202 in Ulster, and 105 in Connaught. The Registrar of Newry, No. 2 District, Newry Union, reports the prevalence of fever in a portion of the town in the last month of the quarter.

Diarrhœa.—There were 435 deaths ascribed to diarrhœa, viz., 83 in Leinster, 152 in Munster, 168 in Ulster, and 32 in Connaught. The deaths in each province correspond very closely with the number registered during the second quarter of 1878.

Simple Cholera.—Only 7 deaths were referred to this cause—4 in Munster, and 1 each in Leinster, Ulster, and Connaught.

The Registrar of Cappoquin District Lismore Union, gives details concerning an eruption "like a commingling of the eruption of scarlatina and measles," of which there were many cases in his district.

THE EFFECT OF THE PUBLIC HEALTH ACT UPON IRISH SANITATION.

Abstract of a few Registrars' Notes.

No. 1.—North-Eastern Division.

Crossmaglen.—The sanitary condition of this district is not at all satisfactory. I have warned the people frequently with regard to cesspools, dungheaps, &c., and very little attention has been paid to my warnings. Other measures must now be put in force. Keeping pigs, goats, &c., in the dwelling-houses is a very common practice. These they can turn out when they see or hear of my going to the place, and they are, as a rule, put in again when my back is turned.

Portaferry.—I do not anticipate much advance in sanitation until inspectors are appointed, having full power to issue orders for abatement of nuisances, institute and conduct proceedings against offending persons, and generally direct the operation of the "Public Health Act."

Bryansford.—The sanitary arrangements of Newcastle are defective owing to the want of main sewers.

Magherafelt—*Bellaghy.*—No improvements in sanitary condition of the district. It is very hard to get the people to understand the danger of having cesspools, manure heaps, &c., at their very doors, still harder to keep them from drinking dangerous water—for instance, one well in this village was condemned by the public analyst (twelve months ago) as utterly unfit for use, &c., and yet the well still remains open, the people still use the water, and all the reporting, &c., went for nothing.

Mullaghglass.—Fever has been very prevalent during the quarter. I have had large posters freely circulated through the district setting forth the powers with which health officers are invested with regard to removal of infectious diseases into hospital. I would beg to draw attention to section 141 of the Public Health Act, in which a penalty of a fine only, without any power of imprisonment, can be imposed in case of opposition to the removal of patients. This deficiency renders the Act *almost inoperative;* it is only laughed at, the public well knowing the money penalty is irrecoverable for the best of reasons; this portion of the Act needs amendment.

No. 2.—North-Western Division.

Ballyshannon.—Health of district is, generally speaking, good. The sanitary arrangements are still very defective; several important changes have been frequently reported to the sanitary authority, but beyond serving notices for abatement, no action has been taken, and in the event of epidemic disease appearing, untoward consequences are likely to ensue.

Glenties—*Doocharry.*—The district is in a healthy state, notwithstanding the filthy condition of the houses and their surroundings. In the majority of the houses cattle are kept in close proximity to the beds, and manure heaps with offensive cesspools are situated immediately outside the doors. The Public Health Act has been a miserable failure, so far at least as my district is concerned.

Carrickmacross—*Donaghmoyne.*—Considerable improvement has taken place in the sanitary condition of the dwellings of the people in this district; however, constant central supervision and an expanded organisation and outlay are necessary for the realisation of the full benefits to be derived from the amended Public health Act. It is to be regretted, in the interests of sanitary science and statistics, that the beneficial clause in the latter for the appointment of registrars at cemetries still remains in abeyance, at least in this Union; were it put in operation the registration of deaths would be much more perfect.

Kilkenny.—The sanitary state of John Street in my district, very bad; no proper sewerage. There have been two cases of fever recently—one malignant typhus, which proved fatal.

PSYCHOLOGY AND THE NERVOUS SYSTEM.

By J. HUGHLINGS-JACKSON, M.D., F.R.S.,

Physician to the National Hospital for the Epileptic and Paralysed, and to the London Hospital.

In a scientific investigation of nervous diseases, it is essential to keep distinct psychology and the anatomy and physiology of the nerve systems. In epilepsy it is imperative. I have been misled by not having seen the distinctness of physical (nervous) states and psychical states in my earlier studies, and thus I feel bold to point out the evil results of the confusion of the two things. In cases of epilepsy we have such different symptoms (at the beginning of, or during the paroxysm, and after the paroxysm), as "balls of fire" before the eyes, spasm of muscles, loss of consciousness, hemiplegia, and actions of different degrees of elaborateness. To consider these symptoms as being on the same platform leads to confusion. We can compare and contrast physical conditions only with physical conditions, and psychical conditions with physical conditions. To take an example: to compare "balls of fire" as being a symptom any way like spasm of muscle is absurd. The former is a sensation, a psychical state; the latter a physical state; the things comparable are discharges of sensory centres, *during which* the abnormal sensation arises, with the discharge of motor centres *from which* the spasm arises. Any psychical states, and any physical states, normal or abnormal, are incomparable; they have nothing whatever in common, even for reasonable contrast; the only possible contrast is, indeed, absolute; the two things being utterly dissimilar.

The distinctness of physical and psychical states has been urged strongly in the most different quarters. I have only to re-urge what has been urged over and over again long ago. What applies to healthy, psychical, and physical states, applies in principle to abnormal psychical and physical states. Pain is as different from the strong physical changes in the sensory nerve and centre affected, as colour in normal vision is from the comparatively slight changes in the optic nervous centres occurring with the psychical state colour. These psychical states occur during the nervous discharges. In all cases we speak of psychical states as occuring *during* or *attending* nervous discharges; not as occurring *from them*, lest that expression should be taken to imply a continuity of a nervous discharge with a psychical state. The pyschical and the physical states occur in parallelism, one does not change into the other; there is no interference one with the other. Two things are said: (1) psychical states are utterly different from physical states; (2) physical states always go along with psychical states. There are two series of states: (1) an immaterial series, psychical (2) a material series, physical; the latter are active states of nerve structures; that is, liberations of energy or discharges. To take an illustration. Colour is a psychical state, there is a correlative physical state, a mode of motion in some nervous arrangements (nervous discharge, or liberation of energy), but there is no community of nature betwixt the two parallel states, colour and molecular motion. Sometimes, however, we hear it said that a colour, say red, consists of so many vibrations or impulses in nervous centres, corresponding to, but infinitely less numerous than, so many etherial impacts, declared by physicists to impinge on our retinæ, when we have that sensation vividly. Supposing this to be, as probably it is, a correct explanation of what goes on physically in our nervous centres; it is no sort of account of the colour red, but only of the material changes *during* our having that sensation. Let us now return to what we said of the absurdity of the comparison of "balls of fire" with spasm of muscles. The comparisons we can make are (1) of the nervous discharges of certain sensory elements, *during which* the "balls of fire" arise, with (2) discharges of motor elements, *from which* spasm arises; the abnormal psychical state *occurring during* the latter discharge which might be compared with the abnormal psychical state of "balls of fire," is a

Digitized by Google

feeling of the limb getting bigger before the spasm becomes actual or decided.

No properly educated person denies that along with every sort or degree of psychical state there is a corresponding physical state. We are all thoroughgoing materialists in that sense. "Within the limits of our experience no one supposes that thinking is done without a body. No philosopher of any school whatever, theological or scientific, maintains that, during the period of human life, there is such a thing as consciousness without brain. None will assert that, under terestrial conditions, we have any experience of psychical manifestation apart from physical structure. (Fiske, "Cosmic Philosophy," vol. 2, pp. 436-7.) During the most refined emotional or ideational state—let us say, without obvious external or peripheral manifestation—there are certainly physical changes, nervous discharges, as much as there are when we sneeze. But the emotional or ideational state is not the nervous discharge.

To speak again of colour in health; when a man sees or thinks of red (red substance), there are two things: there is that of sensation, and there is also a liberation of energy (nervous discharge). We must not say that colour is a function of the elements discharged, but that it occurs during their functioning; function is a physiological not a psychological term. If the term function be used for psychical states, we must say that there are two functions—a psychical one and a physical one. This, however, would be very inconvenient; it is far better to restrict the term function to physiology, making this term include what we may call the abnormal physiology of disease.

I will now show that the distinction above made is one most widely, if not nearly universally made. From the names of the authorities cited, the reader will see that the matter has simply nothing to do with "orthodoxy" in any way. This is remarked because the supposition that it has illustrates well the want of clearness there is as to the real question. Some theologians seem to think the unorthodox *must* be materialists, and on the other hand some materialists think that the insistance on the distinctness of the psychical and physical arises from a desire to uphold the theological systems of the day. Both fail to see that the question is a scientific one, or if the *nature* of the relation be a question, a problem in metaphysics; it has no necessary connection with theology. One of our most distinguished English physicists is continually repudiating a belief in materialism, which is continually being imputed to him. It is commonly supposed that those who hold the Doctrine of Evolution are materialists. This is a great mistake. Spencer writes ("Essays," vol. iii., p. 249): "The Doctrine of Evolution, under its scientific form, does not involve Materialism, though its opponents persistently represent it as doing so. Indeed, among adherents of it, who are friends of mine, there are those who speak of the materialism of Buchner and his school, with a contempt certainly not less than that felt by Mr. Martineau." Fiske writes, ("Darwinism and other Essays"), that "modern scientific philosophy, as represented by Spencer and Huxley, not only affords no support to materialism, but condemns it altogether."

Fiske has written elsewhere—"It is the usual lot of scientific writers, who maintain theories which have not yet become popular with the theological world, to be accused of holding opinions that they not only do not hold, but against which they have, perhaps, on every fitting occassion, publicly and emphatically protested."—"Cosmic Philosophy," ii., p. 432.

Now I give further quotations from very different quarters:—

Sir William Hamilton.—"Those . . . who do not allow that mind is matter—who hold that there is in man a principle of action superior to the determinations of a physical necessity, a brute or blind fate—must regard the application of the terms physiology and physics to the doctrine of the mind as either singularly inappropriate, or as significant of a false hypothesis in regard to the character of the thinking principle."

If this be so we can only use the term—physiology of mind—figuratively; we ought to speak of the physiology of the nervous system.

J. S. Mill.—Speaking of colour, Mill says: "Whatever number of hidden links we might detect in the chain of causation terminating in the colour, the last link would still be a law of colour, *not* a law of motion, nor *of any other phenomena whatever.*"—"Logic," vol. ii., p. 4.

"Let it be shown, for instance, that the most complex series of physical causes and effects succeed one another in the eye and in the brain to produce a sensation of colour; rays falling on the eye, refracted, converging, crossing one another, making an inverted image on the retina, and after this a motion—let it be a vibration or a rush of nervous fluid, or whatever else you are pleased to suppose, along the optic nerve—a propagation of this motion to the brain itself, and as many more different motions as you choose; still, at the end of these motions, there is something which is not motion; there is a feeling or sensation of colour. Whatever number of motions we may be able to interpolate, and whether they be real or imaginary, we shall still find, at the end of the series, a motion antecedent, and a colour consequent."—Mill's "Logic."

Clifford.—"The assertion that another man's volition—a feeling in his consciousness which I cannot perceive—is part of the train of physical facts which I may perceive, this is neither true nor untrue, but nonsense; it is a combination of words whose corresponding ideas will not go together." Again, if anybody says that the will influences matter, the statement is not untrue, but it is nonsense. The will is not a material thing; it is not a mode of material motion. Such an assertion belongs to the crude materialism of the savage. . . . . I may very well say that among the physical facts which go along at the same time with mental facts, there are forces at work. That is perfectly true, but the two things are on two utterly different platforms—the physical facts go along by themselves, and the mental facts go along by themselves. There is a parallelism between them, but there is no interference of one with the other."—*Fortnightly Review*, Dec., 1874, p. 728.

Herbert Spencer.—"Physiology is an objective science; and is limited to such data as can be reached by observations made on sensible objects. It cannot, therefore, properly appropriate subjective data, or data wholly inacceseible to external observations. Without questioning the truth of the assumed correlation between the changes which, physically considered, are disturbances of nerves, and those which, psychically considered, are feelings, it may be safely affirmed that physiology, which is an interpretation of the physical processes that go on in organisms, in terms known to physical science, ceases to be physiology when it imparts into its interpretations a psychical factor—a factor which no physical research whatever can disclose, or identify, or get the remotest glimpse of.

"The relations between nerve actions and mental states form a distinct subject, to be dealt with presently. Here we are treating of nerve-actions on their physiological side, and must ignore their psychological side. Doing this, we have no alternative but to formulate them in terms of motion."—Spencer, "Psychology," vol. i., p. 48.

"Though accumulated observations and experiments have led us by a very indirect series of inferences to the belief that mind and nervous action are the subjective and objective faces of the same thing, we remain utterly incapable of seeing, and even of imagining, how the two are related."—"Prin. of Psy.," vol. i., p. 140.

Elsewhere Mr. Spencer writes: "We can think of matter only in terms of mind. We can think of mind only in terms of matter. When we have pushed our explorations of the first to the uttermost limit, we are referred to the second for a final answer, and when we have got the final answer of the second, we are referred back to the first for an interpretation of it. We find the value of x in terms of y; then we find the value of y in terms of x; and so we may continue for ever,

Digitized by Google

without coming nearer to a solution. The antithesis of subject and object, never to be transcended whilst consciousness lasts, renders impossible all knowledge of that ultimate reality in which subject and object are united." —"Prin. of Psy.," vol, i., sec. 272.

Max Müller.—" . . . the whole of the nerves is outside the mind. A state of nervous action may be parallel, but it never is identical with a state of consciousness ('Principles of Psychology,' ii., 592); and even the parallelism between nervous states and states of consciousness is, when we come to details, beyond all comprehension." (*a*)—Ib. i., 140.

Bain.—We have every reason for believing that there is, in company with all our mental processes, *an unbroken material succession.* From the ingress of a sensation to the outgoing responses in action, the mental succession is not for an instant dissevered from a physical succession. A new prospect bursts upon the view; there is a mental result of sensation, emotion, thought, terminating in outward displays of speech or gesture. Parallel to this mental series is the physical series of facts, the successive agitation of the physical organs. . . . While we go the round of the mental circle of sensation, emotion, and thought, there is an unbroken physical circle of effects. It would be incompatible with everything we know of cerebral action to suppose that the physical chain ends abruptly in a physical void, occupied by an immaterial substance, which immaterial substance, after working alone, imparts its results to the other edge of the physical break, and determines the active response—two shores of the material, with an intervening ocean of the immaterial. There is, in fact, no rupture of nervous continuity. The only tenable supposition is that mental and physical proceed together as undivided twins. When, therefore, we speakof a mental cause, amental agency, we have always *a two-sided cause;* the effect produced is not the effect of mind alone, but of mind in company with body."—Bain, "Mind and Body," p. 131, 1873.

David Ferrier.—The above quotation is given in Dr. Ferrier's work, "The Functions of the Brain." Ferrier, after giving the quotation, writes:—"In accordance with this position it must follow, from the experimental data, that mental operations in the last analysis must be merely the subjective side of sensory and motor substrata. This view has been repeatedly and clearly enunciated by Hughlings-Jackson, with whose physiological and psychological deductions, from clinical and pathological data, I frequently find myself in complete accordance."—"Clinical and Physiological Researches on the Nervous System;" reprints from *Lancet*, 1873.

Huxley.—"If I say that thought is a property of matter, all that I can mean is that, actually, or possibly, the consciousness of extension, and that of resistance, accompany all other sorts of consciousness. But . . . why they are thus associated in an insoluble mystery."—"Lay Sermons," p. 341.

Du Bois Reymond.—"It seems, indeed, on a superficial glance, as if we could explain certain mental processes and dispositions, *e.g.*, memory, mental habits, &c., by means of a knowledge of the material processes in the brain. . . . . The least reflection teaches that this is a delusion. What conceivable connection exists between definite movements of definite atoms in my brain on one side, and on the other, the facts—not further definable, not gainsayable—'I feel pain, pleasure, have a sensation of sweet taste,' &c.? . . . It is absolutely inconceivable that a number of atoms of carbon, hydrogen, nitrogen, and oxygen, &c., should not be indifferent how they are lying and moving, how they lay and moved, and how they lie and will be moved; we cannot see in any way how, out of their co-operation, consciousness can arise."—"Ueber die Greuzen des Naturerkeunaus," p. 25.

(To be continued.)

(*a*) He is speaking of language, and continues—"Language, on the contrary, is not outside the mind, but is *the* outside of the mind." The references in the quotation are to Herbert Spencer's Psychology.

ON UTERINE INFLAMMATION AFTER THE MENOPAUSE.

By EDWARD JOHN TILT, M.D.,
Past President of the Obstetrical Society of London.

IV.

THE organ, whose last pathological troubles I am sketching, is gifted beyond all others with a power of physiological increase and diminution. The surprising growth of the womb during pregnancy, and its return to nearly its original size in about two months, is of course the most striking example of this organic elasticity, but it is closely imitated by the considerable uterine enlargement, that precedes the menstrual flow, and by the shrinking of the womb to its normal size when the flow ceases. Pelvic arrangements of blood-vessels contrived to afford ample supply of blood for these physiological enlargements, almost always lead to considerable enlargement of the diseased womb, and a return to its right size by another kind of involution, is the best sign that uterine disease has been cured. Lastly, there is that final process of uterine involution which effectually bars the liability of the womb to diseases that may have been most troublesome. If, notwithstanding the menopause, this final involution be indefinitely delayed, there is no immunity from uterine diseases, although they will be less frequent and their type less acute. The enlargement of the body of the womb may be the result of long standing chronic metritis, but I am more and more convinced, that puerperal defective involution during the last decade of uterine life is the prime factor of uterine pathology after the menopause. The reduction of the puerperal womb by fatty degeneration being too soon checked, it settles down into a permanent state, resembling hypertrophy, which effectually delays the process of climacteric involution. I have occasionally met with this simple uterine enlargement in healthy women many years after cessation; I believe it to be much more frequent than people suppose, that it passes unobserved in healthy women, in lapse of years, the womb becoming a fibro-cartilaginous mass. When this uterine enlargement after the menopause occurs in delicate women, attention is sometimes drawn to it by the co-existence of vaginitis and of cervical inflammation, and, as in a case related, the lining membrane of the body of the womb may be hyperæmiated, or its veins in a state of varicose enlargement, so that considerable bleeding may follow the gentle use of a wax bougie. As a rule, however, when attention is drawn to the fact of the womb having remained too large after the menopause, it depends upon some form or other of internal metritis, the legacy of a previous period. The mucous membrane may be found inflamed and ulcerated, or it may be mammillated and have a fungoid appearance, a condition long ago recognised by Recamier as leading to repeated flooding. I do not assert that the rare cases of flooding, independent of cancer, occurring after 60, always depend on this fungoid condition of the uterine mucous membrane, but it was present in women past 50 years of age, in six out of the eleven cases, in which this lesion was found in the dead-room by Prof. Kœberlé, (*a*) of Strasburg, the ages of these women being 32, 38, 40, 45, 48, 52, 62, 62, 65, 65, and 76. I think it is better to refer these forms of disease to chronic internal metritis, as I have done in my work on "Uterine and Ovarian Inflammation," rather than to describe them as "leucorrhœa of old women," as did Dr. Mathews Duncan, many years ago in the *Edinburgh Journal of Medicine*, for in some of these cases there is no discharge, and because there was ulceration of the mucous membrane of the body of the womb in the only case he examined after death. Real leucorrhœa, or the greatly increased secretion of mucous from the vagina, is rare after cessation, and a vaginal discharge is usually found to depend on vaginitis. With regard to the sym-

(*a*) "Des Fongosités de la Cavité Uterine." Dr. Goldschmidt, These, Strasburgh. 1859.

Digitized by Google

ptoms of such senile metritis, the discharge varies considerably; it may be milky and very abundant, or more purulent and scanty, or mixed with blood, or pure blood oozing away without check through a freely dilated cervix. An excellent characteristic of internal metritis, at all ages, is the gradual accumulation of pus in the body of the womb, giving rise to a sensation of fullness, and of a dull heavy weight above the pubis, followed at the end of a few days by stabbing pains, and by the sudden expulsion of half a teacupful of pus, which is often supposed to come from an abscess. Senile internal metritis is more likely to show itself in this way, and I have known this round of symptoms to be repeated several times, with several months interval of peace between these attacks. Such cases exemplify another important factor of uterine pathology in old women, which is, that uterine involution does not always progress *pari passu*, in the body and in the cervix, that the body of the womb may be still large and distended by secretions that find a difficult egress, through an involuted cervix, and a strictured canal. The cervical canal may be completely obliterated, so that none of the accumulated fluid can escape. In such cases the patient may suffer little or not at all, except at intervals of a few months, or longer; she then has a bearing-down sensation of fulness above the pubis, and the womb may be sometimes felt to be large, and it may be the chief seat of pain. In an exceptional case, there were one or more attacks of pain every day, and nothing more resembled labour pains, as she lay on her back, groaning or screaming, with face injected by tugging hard at a sheet tied to one of the bed-posts. In most cases, the pain is felt on one or other side of the womb, and there is more or less back pain and inability to walk. There may be nausea, vomiting, constipation, incontinence of urine, with great and varied symptoms of cerebral disturbance. In such a case I order hot hip-baths, hot poultices to the abdomen, followed by the application of a stimulant liniment, a purgative, henbane pills, or a bromide mixture. In a fortnight the symptoms subside, and the patient recovers her usual health for some months or longer, until the recurrence of similar symptoms. I can only account for these by supposing that, from some unknown cause, there is occasionally an extra accumulation of uterine secretion, and that by the subsequent absorption of the watery parts of it, the strain is taken off the over-distended womb. This is a rare disease, and I have never seen it lead to a fatal termination, except in the case of an old lady, who I attended with Mr. Walker, of Peterborough. When this lady was about 60, I had to remove from the os uteri two small polypi, and as there was ulceration, or an hypertrophied cervix, I applied potassa fusa cum calce. The menopause had long passed, so I did not think it worth while to take steps to prevent the closure of the os uteri. This patient enjoyed fair health for many years, after which she suffered in the way I have described about every six months. When 74, and fourteen years after the little operation, she was seized with acute pelvic peritonitis, with great pain and sickness, and died in a few days. There was no post-mortem examination, and as there was no intestinal disturbance, I cannot help thinking there was a rupture of the womb and effusion of the uterine contents into the peritoneum, as in a case related by Duparque, in which, ten years after the menopause, a patient died in the midst of severe pain, and on opening the body, a large quantity of blood was found in the peritoneum, and it had evidently come from the distended womb, for there was a rent in the fundus, while the cervix was cartilaginous, and its canal obliterated. In other instances the obliteration of the cervical canal has been observed in connection with an enlarged womb containing a caseous-looking fluid, and some of the cases described as hydrometra have no other origin.

Treatment.—If there be chronic inflammation of the cervix, the first thing is to cure it, for that may suffice to cure internal metritis. The repeated application of the solid nitrate of silver to the cervix for the cure of ulceration has appeared to me to bring about a decrease in the size of the body of the womb, and Scanzoni reports having seen this practice to have rapidly reduced the size of the womb, which had risen two inches above the pubis, to its level, in a woman aged 57. I have applied blistering liquid to the skin above the pubes, giving astringent injections, with the addition of Condy's fluid, if the discharge be fœtid, prescribing extract of nux vomicæ in conjunction with ergotine. I have carefully looked after the cervical canal to maintain its permeability, dilating with laminaria bougies whenever the womb occasionally ejects its contents by a spasmodic effort, for if there be not a free passage to the exit of uterine secretion, internal metritis cannot be cured, whatever may be a woman's age. I have seldom injected a solution of nitrate of silver into the womb in such cases, and supposing life to be endangered by excessive purulent discharge, which I have never observed, I should rather fully dilate the cervix, bring down the womb, and swab its internal surface with fuming nitric acid. The same treatment is the best for the rare cases of dangerous flooding in old women, which cannot be checked by the intra-uterine injection of tincture of iodine, or by a solution of the tincture of subsulphate of iron. Flooding was nearly fatal in a patient of Dr. West, aged 51, and at page 251 of the third edition of my work on the Changes of Life, I have related a fatal case of internal metritis in a lady aged 64, death being due to long-continued blood-loss, intense uterine pain, want of sleep, and an inability to keep down food. In the rare cases in which I explained to myself considerable pelvic distress by the extra accumulation of secretion in the womb, owing to cervical obliteration, I have never sought to re-establish the permeability of that canal, but the cases just given show that it might be justifiable to do so. With regard to the prevention of uterine inflammation in old age, the gynæcologist should never interfere with the permeability of the cervical canal if he be obliged to operate on the cervix, whatever may be the patient's age. When the womb is found to be much too large after the menopause, it is well to try to reduce it, for even if it be free from disease it is a standing menace to the future health of a woman, particularly during the two years subsequent to the menopause, during which the womb is still more or less subject to congestion, without efficient means of relief, and it may be useful in such a case to take from the arm eight or ten ounces of blood. Astringent vaginal injections have seemed to me of service; also the alternate exhibition of iron and strychnia in combination with ergotine. When defective involution of the body coincides with a hard hypertrophied cervix, the application to it of an issue, by means of potassa fusa cum calce, and the subsequent dressing of the womb with tincture of iodine, may be sometimes resorted to, as means of reducing the size of the entire organ.

Clinical Records.

CASES OF CHRONIC DYSENTERY.

By C. HANDFIELD JONES, M.B. Cantab, F.R.S.,
Physician to St. Mary's Hospital.

No. 1.—S. H., æt. 45; admitted July 14, 1876. Served all through the Crimean war, and 13 years in India. Had dysentery in the Crimea, everybody had it; in India had slight fever and pain in right side, lasting only a week, no other illness. Has been ill over six months, got ill from being at Millbank in charge of convicts. He was sergeant-major, and weighed 14 stone when he left the army. After two years of Millbank he was a wreck, and had lost 52 lbs. Has had to walk four miles, twice a day, to and from his work, got very weak. He has been suffering during the last six months with continual purging, alternating with constipation, with pain and swelling of his abdomen after food. His bowels act six times a day or oftener. Has passed a good deal of blood per anum, but has not passed any during the

Digitized by Google

last fortnight. Ordered Acid muriat., ℥ij ; acid hydrocy. dil., ℥iij ; tr. calumb., ℥v ; aq., ℥j ; t.d. Gummi rubri, gr. v, in pil., t.d. Simple diet—milk, beef-tea, two eggs, ground rice pudding. He improved very materially under this treatment, said he was a better man than he had been a long while. One relapse occurred after eight or nine days of treatment, but soon gave way to rest.

No. 2.—H. B., æt. 47 ; admitted June 1, 1877. He had cholera two years ago in India, followed by dysentery, which lasted four months. He was operated on for urethral stricture 12 years ago, partial stricture still exists. No enlargement of liver or spleen. Emaciated, arms and legs very thin and wasted. Is anæmic. Has pain occasionally in abdomen at site of large intestine. Has frequent calls to stool, but has no pain or straining now, as he used to have lately. Motions watery, and almost colourless. Occasionally has griping pains. Ankles have been much swollen, but are not now. Tongue small, moist, clean, very dry at night. Lungs and heart normal. His weight on 14th was 78lbs. On 30th, it had increased to 87 lbs., on July 9th it has declined to 85 lbs. Red gum, gr. v, quater die, was tried in this case, but without benefit, the purging was increased. Liq. ferri perchlor., ℥xx, with acid muriat. dil., ℥xv, t.d., and cod oil, ℥ij, t.d. was of much use. Liquid extract of coto seemed, however, even more effectual ; he stated, after taking ℥x t.d. for a week, that it had done him a world of good, had made another man of him. He went out August 2.

No. 3.—J. K., æt. 24, soldier ; admitted January 15, 1872. He was quite healthy before he went out to India, was in Madras three years. After 12 months he got diarrhœa and dysentery, and then liver disorder. Used to to take a good deal of spirit in India. He had a slight touch of fever and ague in Burmah, gets chilly sensations now and then. He was invalided and sent home for liver and dysentery. Has been at home two years, and has had repeated attacks of dysentery. Has passed blood and slime, and now everything he takes seems to go through him directly, he passes slime, but no blood. Has great tenderness over region of gall bladder, not much in other parts of abdomen. Liver dulness extends from 4th space to margin of ribs. Abdomen not distended. Feet stone cold and numb the last three weeks. Is very weak. Temp., 98·6 ; pulse, 100, small and weak. Sometimes the purging stops, and he has no stool for three or four days. Brandy, 3 oz. Simple diet—milk, ground rice pudding. Gummi rubri, gr. x ; glycerini, ℥j ; aq., ℥j ; quater die.

Jan. 18th.—Has got pain to-day in lower right side, increased on respiration—continuous poultices.

24th.—Bowels act eight times a day, no blood or slime passed, the stools are much firmer than they were, pain in right lower side almost gone, only felt when he draws a deep breath. Pulse 92, of fair force.

Feb. 1st.—Only two stools a-day.

14th.—Doing perfectly well. His weight a little before admission was 113 lbs., yesterday was 133 lbs.

17th.—Gone out well.

He was re-admitted April 22, 1872, in a state of great exhaustion with severe recurrenee of dysentery, which had come on soon after he left hospital. Treatment was unavailing, and he died May 1.

There were several small recent abscesses in the liver, and one as large as a good sized orange, evidently of old date. The liver weighed 103 oz. The cæcum at its lower part showed dark red, congested mucous membrane, eroded at small spots into ulcers with grey bases ; at a little distance these coalesced, the mucus membrane disappeared, and the whole of the large intestine was a sheet of the same grey looking ulceration, marked here and there by streaky deposits of black pigment. Mesocolic glands enlarged and hard, and dark coloured. A little peritonitis. Splen pretty normal.

No. 4.—J. P., æt. 32 ; admitted December 22, 1874. Has been in India and Africa, had some fever. Ill now six weeks, has lost much flesh. Bowels usually act eight to nine times a day, stools some days loose, on others more solid, a little blood is passed sometimes. Abdomen feels sore, especially at lower part and left flank, he feels sore inside ; it is collapsed. Has nausea at times, but no vomiting. Pulse 96, open, soft. Neither liver nor spleen enlarged. Tongue pale, natural. Ordered Gummi rubri, gr. x ; glycerinii, ℥j ; aq., ℥j ; quater die. Simple diet—rice pudding, beef jelly.

24th.—Temp., 98·6 ; pulse, 64 ; resp., 20. He feels a good deal better, stools are more consistent, the last are slightly streaked with blood.

28th.—Five stools in last twenty-four hours, more solid. Two eggs. Fotus tereb. abdomini.

31st.—Up, bowels acting four times a day, sent back to bed.

Jan. 4th, 1875.—Keeps in bed, has three stools a day ; says that the turpentine stupes caused the stools to be more frequent and bloody. Pt. mist., c. gr. xv, gummi.

7th.—Has had seven stools a day since. Catarrh very prevalent. Argenti nitratis, gr. vj ; tr. opii, ℥x ; aq. destil., ℥iv ; m. et solve fl enema, bis die.

9th.—Enemata retained fairly well, but stools have been more frequent—nine per diem, and bloody ; one I saw consisted of shreds of mucus and blood, was scanty. Pulse 100, feeble ; not much pain, looks low. Pulv. ipecac., gr. v ; mist. mucilig., ℥j ; t.d.

14th.—Three stools a day, feels better, is up, little or no nausea from medicine. Fish.

18th.—Four stools a day, ordered again to bed. Ext. ergotæ liquidi, ℥j ; aq., ℥j ; quater die.

25th.—Has had only two stools per day, until last 24 hours, then only one. Feels very well.

28th.—Only one stool a day, feels quite well, allowed to be up a little.

Feb. 4th.—He remains quite well, is about the wards. Discharged. Pte. mist., bis die.

No. 5.—J. P., æt. 24 ; admitted March 1, 1879. He was in this hospital in 1875, left in September, went back to his work as ship's steward, but did not make a voyage. Has been working on and off since that time, has been feeling extremely weak lately. While he abstained from opium or brandy he had had 24 motions a day. On March 14th he had 32 motions between 8 p.m. and 6.30 a.m. He describes the motions as consisting of blood and matter, with some cheezy mucus floating in the liquid. Lately he has been getting thickheaded, cannot calculate. Has taken gr. x of pulv. doveri frequently, and describes the effect produced as follows :—"Head, trunk, limbs, are like dead weights, and he feels that he must lie down. He remains in this state about three hours, feeling as if everything in him was dead, except his brain. At these times his thoughts are so vivid and rapid that he feels as though he was on the verge of delirium, but he never has been really delirious. The effects pass away in about three hours, leaving him just as he was before." Skin cool ; pulse 56, very feeble and compressible, irregular. Heart normal. Temp. normal, one morning 96·8. Chest ill-formed, pigeon-breasted. Loud rhonchi in both fronts, crepitations in both backs, no dulness. Has had dry cough for a week. Tongue red and large, dorsum very cracked ; appetite very good. He suffers severe pain across the abdomen, especially on the left side. Pain is increased shortly before a motion." As soon as he wakes in the morning the excessive pain brings on a motion, he then passes more blood than at any other time. Motions are quite fluid, dark brown in colour, contain blood-streaks, and some whitish clots. He was ordered on admission—Gummi rubri, gr. v, in pil., and has taken by 3 p.m. to-day (22nd), 7 pills ; the bowels have acted 15 times in the same period. Intermittent pill. Pulv. ipecac., gr. v, in pil., quater die. Simple diet—milk, beef-tea.

24th.—Feels much better, stools less frequent, five or six he thinks in 24 hours, containing much less blood. Left iliac region tender. Improvement was marked on 23rd, pulse then was extremely small and feeble. I offered him stimuli, but he declined. Pulse 72. Broth diet on 23rd. Resumat pil. gummi rubri.

Digitized by Google

26th.—Yesterday there was more blood in the stools, to-day he has had three stools by 2.30 p.m., none in the night—stools contain a little blood. Pain in belly gone, he had a turpentine stupe applied there. Pulse less weak, of more volume. Brandy 2 oz. ordered on 25th.

28th.—Is rather worse, bowels more relaxed. Capiat pulv. ipecac., gr. ij, in pil. altern. cum pil. gummi rubri.

29th.—Much better, no stool from 5 p.m. to about 6 a.m. of to-day, only one since.

April 8th.—Doing very well, has only had one stool a day during last four days. Stools are formed. Ordinary diet—greens. Went out soon after.

No. 6.—S. C., æt. 43, clerk; admitted March 25, 1879. Anæmic, with greyish hair. Has been several years in the Tropics, returned in September, 1877. While in India he had no bronchitis, but had dysentery in Ceylon, no fever, although he was a good deal in the lowlands. Married, children healthy. Family history, good. He spat up a little blood 8 or 10 years ago, but only streaks, he had then a bad cough. Pulse 95, weak. Skin cool. Temp., 98·8. He has three to six stools in 24 hours; he has had three stools to-day, all containing blood; has not had a natural stool since his return to England. Says he has suffered from piles for some week; when a motion occurs, he thinks that the bowel protrudes, and that this causes the bleeding. Has sometimes a little griping in the belly, has no tenderness, but a dragging sensation as if his bowels were falling downwards. No distinct tumour in abdomen, but the left hypochondrium is dullish, as well as the adjacent lower side. Has lost flesh lately, but is not very thin. The last three days his dysentery has got worse. Defective entry of air in both backs, expiration is prolonged and attended with rbonchi, same condition in fronts. Percussion note in right upper front slightly inferior to that in left, surface in right is slightly flattened, and air enters there rather less freely. Acidi nitrici, ℥ij; tr. calumb., ℥x; liq. morph. bimec., ℥v; aq., ℥j; t.d. Fotus terebinth. dorso. Cold sponging to anus. Simple diet—chop.

29th.—Had seven stools in 24 hours, up to 7 p.m. last evening, most of them containing blood except the last one or two. Has been taking last two days pulv. ipecac., gr. j; ext. conii, gr. j; in pil. quater die. Omit pil. Fotus terebinth. abdomini.

31st.—Nothing discoverable at anus, has pain across mid-abdomen and griping, and has had till to day six stools in 24 hours. Omit mist. pulv. ipecac., gr. ij; opii, gr. ¼; in pil. quater die.

April 3rd.—Better, less pain in abdomen, stools fluid, bilious; blood is occasionally passed—is always distinct from the stool.

8th.—No blood in stools now, has three a day. Nothing very marked found on rectal examination on 7th. Pain is felt across upper abdomen; some tenderness in both hypochondria. Pulse 92, jerky. Began yesterday pulv. ipecac., gr. ij; gummi rubri, gr. v; opii, gr. ¼; in pil., ij quater die. Broth diet.

14th.—State same. Bowels loosely open three or four times a day. Omittantur pil. Ext. ergotæ liquidi, ℥j; aq., ℥j; t.d.

17th.—Has about four stools a day, liquid, more offensive than before. Belly quite soft and lax, not tender any where definitely. Olei ricini, ℥x; liq. opii sedat., ℥ij; mist. mucilag., ℥ij; 2dis. horis.

21st.—No benefit; stools very offensive and liquid. Glycerole of tannin, ℥j; aq., ℥j; 4tis horis.

26th.—Stools less liquid, always preceded by griping; has four in 24 hours. Baln. calid.

28th.—Same. Pl. argenti nitratis, gr. x; tr. opii, ℥xv; aq. dest., ℥v; m ft. enema in dies.

30th.—No blood in stools now for six days, seems better.

May 1st.—Stools liquid, blood bright red in last but one. Ergotine disc subcutaneously, bis die, omittr. alia.

3rd.—Has been passing blood in stools ever since; the blood is red and clots; the stools are most offensive. Pulse 100, weak and small. Pain is felt across upper abdomen; there is no tenderness, but griping when the bowels are about to act. Pulv. ipecac., gr. v; opii, gr. ½; in pil., ij quater die.

8th.—Not improving. Liq. ferri perchloridi, ℥j, glycerinii, ℥j; aq., ℥j; quater die.

20th.—Improved, has two stools a day, and they are more solid; has simple diet—fish and sago.

26th.—Only one stool a day, and that formed, no pain in abdomen.

June 6th.—Has had no recurrence of symptoms; has kept in bed. Discharged.

Remarks.—These six cases have been met with in about 1,200 taken indifferently. The subjects are all male. All had been in the Tropics (there is perhaps some doubt about No. 5), and had acquired their malady there. Red gum was tried in all the cases; it failed in 3, and succeeded in 3. In 1 of the failures, and in 1 of the successes, it was combined with ipecacuan. In the latter the combination seemed essential to success. One case was cured by ergot, one by ℥j doses of liq. ferri perchloridi. This last case had proved very refractory, and the success of the iron, which was suggested by my house-surgeon, Mr. Brown, was very remarkable. The analogy between this case and one of extremely asthenic bronchial catarrh complicating rheumatic fever, and attended for a time with quasi-gangrenous fœtor of the breath and sputa, was shown by the same remedy succeeding in both. In 2 of the cases ipecacuan was of use in mitigating the severity of the recrudescences, though the astringents were necessary to produce a permenent effect. The good effect of rest in bed is by no means to be ignored, but it is abundantly clear that it alone did not suffice to obtain recovery. The cases show how varying are the conditions in chronic dysentery, and how much depends on what we must term the idiosyncrasy of the individual. One or other of the astringent tonics will almost invariably be necessary, but it is scarce possible to say before trial which will suit best.

No. 3 affords a warning against tao early discontinuance of medical care, however great the improvement may be. The larger abscess in the liver no doubt existed during the patient's first stay in the hospital, and caused the pain in the lower right side. Probably, under long continued treatment he might have soundly recovered.

Comparing chronic dysentery with acute, the condition which is cured by large doses of liq. ferri perchlor. with that which yields to large doses of ipecacuan, the difference clinically is enormous, and should suggest to pathologists the existence of some factor in the inflammatory process, apart from the blood and vessels. This I have always insisted is the influence of the tissues, which when perverted seems to arrest the blood-current, judging from the observed effects of ammonia in producing stasis in the frog's web. In acute inflammation, especially in sthenic habits, the tissue influence is a principal motor of the process; in chronic it counts for much less, except during the exacerbations.

Translations.

HYSTERIA MAJOR.

By PROFESSOR CHARCOT,

Physician to the Salpetrière Hospital, Paris; Member of the Academy of Medicine of France; Fellow of the Clinical Society of London, &c.

Abstracted by T. M. DOLAN, F.R.C.S.Ed., Halifax, Yorks. (*a*)

(*Continued from page* 178.)

THE convulsive attack of hysteria major, with the characteristics which have just been sketched, is not peculiar to patients in the centre where our observations have been made.

For a long time it has been known that imitation may have a certain influence on the form of the complications assumed

(*a*) *Progrès Medical.*

Digitized by Google

by hysteria. But this is not the case, as far as regards (at least) the leading features of our description. These features are found without any fundamental qualification in patients isolated from town, where the influence of imagination could not have any play. They are found in observations made abroad. This is testified, for instance, by the facts recently collected in Scotland by Dr. Inglis, assistant at the Edinburgh asylum. We find in the descriptions of such authors the various phases in succession: epileptoid major movements, attitudes of passion, &c., &c. The decisive influence of compression of the ovary is equally noted. The descriptions of Dr. Leiderdorf, of Vienna, offer confirmatory evidence.

The study of ancient convulsive epidemics bears evidence that hystero-epilepsy has not changed with the times. We find, in the relations given of these epidemics, the principal characteristics on which we have insisted. The epileptoid convulsions are almost constant and clearly indicated, but the authors principally expand in their description of the second phase; being struck by the frightful contortions and strange movements, which were frequently attributed to the influence of a supernatural force.

The *arc de circle*, for instance, is noticed in most of the celebrated epidemics; in the hystero-demonopathy of the religious of St. Elizabeth at Lousers, from 1642 to 1646, in a similar attack of the nuns of Naertet, Germany, and also in the *convulsionnaires* of St. Mèdard.

The attitudes of passion are found isolated under the form of ecstasy or *representations* according to the expression used at St. Mèdard. Finally, as regards the latter *convulsionnaires*, we have the recital of attacks of religious and phophetic delirium, which clearly belongs to the delirium of the terminal period of the attack.

A point of study of the most immediate interest, consists in the resemblance between the preceding description of an attack of hystero-epilepsy and the description given by classic authors of an attack of common hysteria. It clearly results from this similarity that we cannot separate these two affections to make two maladies of a different nature, and that common hysteria or *petite hysteria* must only be considered as an attenuation or a rudimentary state of hystero-epilepsy or hysteria major.

Some quotations borrowed from the works of some of our principal classic writers on hysteria, M.M. Briquet and Bernultz, will prove this. In the midst of the description which M. Briquet gives of the convulsions forming part of an attack of hysteria vulgaris, the following passage is found, manifestly in relation with the epileptiform convulsions of the first period:—

"The face swells; the jaws clasp one another, so as to produce gnashing and grinding of the teeth; the neck swells; the muscles of this part and those of the chest contract spasmodically. The thoracic walls either remain immovable, with their muscles contracted in such a manner as to threaten asphyxia (tonic phase), or move convulsively and rapidly as in the most severe attack of asthma (clonic phase). The muscles of the abdominal walls are agitated with similar movements to those of the chest."

Mr. Bernultz is perhaps more expressive still:

"At the moment when the hysterical cry is produced suffocation appears at its summit, there is a kind of general tonic spasm, sometimes of tetanic stiffness of the whole body. The figure is swollen, injected. . . . . The neck is tumefied; the carotids beat violently; the jugular veins are swollen and distended, whilst the abdomen is slightly meteorised. There is considerable oppression as if threatening asphyxia. . . . . Ordinarily the time of the attack is very short, and convulsions more or less general (second period) immediately succeed loss of consciousness."

Who does not recognise here a sketch of the epileptoid period?

The second period seems to constitute the greatest part of hysteria vulgaris. The authors describe it at length, as Briquet, thus:

"Most ordinarily the patients are agitated at one time as if they wished to escape violence, at another as if they resisted restraint. . . . . At another time the upper and lower extremities move in all directions; flexion, extension, rotation, adduction, abduction, succeed one another with the greatest rapidity. The body moves sometimes like a worm, at another time contracts. The head is agitated backwards, forwards, sideways. The hands are carried instinctively either to the neck, which is violently seized as if to tear away some body which is causing it great restraint, or towards the epigastrium, which the patients endeavour to tear or to strike; at another time they try to pull off their hair or tear their face. The force employed in some of these acts is so great that many strong persons can scarcely hold a frail young woman, who in such moments is capable of bending the iron laths of a bed."

Briquet has also noticed the cry of fury accompanying the ordinary movements of the second period:

"There are yet a certain number of hysterics whose cries last during the whole period of an attack. These cries are analagous to those raised by a person suffering, or who was resisting violence."

The description of Bernultz resembles that of Briquet:

"These convulsions when they are typical have a special physiognomy; persons unacquainted with medicine recognise them. They are very difficult to describe on account of the disorder accompanying them. The members one instant stiffen (first period) convulsively; we have abduction, adduction, extension, and flexion, and *vice versa*."

The third period, or period of *attitudes of passion*, is not less clearly indicated. M. Bernultz even employs some words very similar to those used by Charcot, when he designates under the name of "*expressions passionnées*" the different movements of the patient in this period. He says when the convulsive movements have lost their energy, and when the figure only presents a slight turgescence, a new phase developes, in a certain number of hysterics. Their *faces*, up to that passive, become animated, and the seat of various expressions. The eyes contribute to this effect by frequent winking, and there is sometimes nystagmus. A variety of expressions are produced, as anger, terror, voluptuousness, whilst there is muttering of incoherent words by some patients.

The attitudes of passion may be recognised in this description. M. Briquet has not failed to remark them as the following passage clearly proves:—

"The patients present a succession of tableaux, in which may be found the expression of all the passions of the soul and of the sensibilities.

"During the convulsions patients are often seized with delirium more or less lively; it has generally some relation to scenes that the patient believes she is acting in, or to thoughts with which she has been occupied. During the attack hallucinations, ecstasy, often come on."

The delirium of the fourth period has not escaped the sagacity of these observers. It is thus described by M. Bernultz:

"When the period of passionate expression has tided over the eyes become humid; tears flow in abundance constituting a veritable crisis of sobs, during which the patients completely recover consciousness. . . . . Some patients in place of bursting into tears have an attack of convulsive laughter; others are semi-delirious, and relate in an incoherent and unintelligible manner some fact or event, or involuntarily allude to some indiscretion, very compromising to themselves or others."

M. Briquet expresses himself as follows:—

"After lasting some time the convulsions cease; consciousness returns, but scarcely has it returned when sobs burst forth. In some cases, in place of tears there is laughter. A state of delirium and dreaminess exists in a few patients, during which unreasonable things are done."

In thus collecting and co-ordinating these scattered fragments nothing is wanted to complete the description. If the authors from whom these quotations are borrowed, had only in view an attack of hysteria vulgaris, that is a powerful argument in favour of the opinion maintained by Charcot, that hystero-epilepsy is only the most intense degree of hysteria. It is also an argument in favour of the excellence of the method, which consists in considering the major types before entering on the study of imperfect forms. For it is incontestible that the description of an attack of hysteria vulgaris is singularly clear, when considered by the light of ideas furnished by the study of hysteria major.

(To be continued.)

The Société de Biologie in Paris has opened a subscription-list for the purpose of erecting a monument to Claude Bernard. It will take the form of a statue, which, by permission of the Municipal Council of Paris, will be placed opposite the chief entrance of the College de France.

THE MUSEUM DEPARTMENT OF THE BRITISH MEDICAL ASSOCIATION.

One of the most complete and interesting stands in the Exhibition, was that of Messrs. Fannin and Co., of Dublin, which contained not only the exhibits of the firm itself, but those shown on behalf of Messrs. Krohne and Seseman. Messrs. Fannin showed, Browne's electric polyscope, for illuminating the mouth and other cavities; Allen's carbolic steam apparatus; Dr. Gordon's impaired splint for fracture of the radius; Dr. Stevenson's splint for fractured patella; Dr. Sparner's 30 cell constant current battery; Mr. Butcher's box-splint and straight thigh splint; Spencer Wells' new torsion forceps; Mr. Hayes' splint for excision of knee-joint; Parkes' new English medical microscope; Allen's croup kettle; Alexander's pocket clinical urine case; Siemann's (New York) new patent clinical thermometer; Dr. Shrady's new subcutaneous saw knife and bone rasp; Sussdorf's tupelo tents for dilating os and cervix uteri; Pond's improved sphygmograph; Dr. R. McDonnell's apparatus for intravenous injections of blood, milk, &c.; Dr. Kidd's cephalotribe; Drs. Hayes, Corley, and Richardson's hernia knifes; new screw dilating vaginal speculum; improved lever Sim's speculum; new instrument for hare-lip; endoscope; Lennox Browne's ophthalmoscope; Davy's lever for compression of iliac artery; Dr. L. Atthill's intra-uterine canula. On behalf of Messrs. Krohne and Seseman, the firm exhibited Schrafter's trachea dilators; Lennox Browne's laryngoscope; Parker's prepuce dilator—laryngo-phantom; Bryant's double splint for hip-joint disease or fracture of the thigh or lower leg; Thomas's splint for diseased knee-joint or fractured thigh; Spencer Wells' piessure forceps.

SURGICAL INSTRUMENTS.

Mr. Lester, pharmaceutical chemist, Cork, represented Messrs. Wright and Co., 108 New Bond Street, London, and exhibited on their behalf, an extensive assortment of surgical instruments, including almost every instrument of recent introduction, and many special instruments used by our leading men. There were to be seen on this stand, Lister's spray producer, Barnes' obstetric bag, Smith's cleft palate case, Sparner's portable induction apparatus, bi-valve stethoscopes, Alexander's urinary case, jointed throat forceps, Sim's fenestrated speculum, Hoffmann's uterine syringe, Sigmundi's injection syringe, Kristolle's vaginal speculum, Zanfal's nasal dilating speculum, and a great number of others.

Mr. Marr, 27 Little Queen Street, London, exhibited several of Prof. Lister's steam spray producers, such as are used by Prof. Lister himself. All these spray producers exhibited by Mr. Marr, were made under his personal supervision.

Messrs. Maw, Son, and Thompson, of London, exhibited an improved form of Dieulafoy's aspirator, several écraseurs, lithotrites, the clinical case suggested by Dr. Dobell, resection saws, urethra dilators, uterus forceps, an ingenious form of sphygmograph, with circular movement, a number of clinical thermometers, with the recently improved magnifying lens and indestructible index. This firm also exhibited a very handsome set of ivory-mounted amputation knives and saws of their own special manufacture, and an improved form of enema.

Mr. Lester, of Cork, had also an extensive show of all the new chemicals, new drugs, and new preparations used in medicine, but which have not yet received a place in the Pharmacopœia, such as the salicylates of quinine, potash, and soda, thymol, salicylic acid, jaborandi leaves, and its alkaloid, pilocarpine, coco-leaves, and preparations of coco, caffeine, and theine. The citrate of caffeine, and a great many other chemicals, which were remarkable for their beautiful crystalline form; and many of the alkaloids were remarkable for their costlines. Nearly all the alkaloids of opium were exhibited by Mr. Lester, some of considerable rarity, such as cryptopia, apomorphia, narceine, papaverine, &c. The new medicinal syrups, such as the bromides, iodides, phosphates, arseniates, &c., all made in Mr. Lester's laboratory. Mr. Lester showed al the Al cod-liver oil, cod-liver oil emulsion, powdered extracts of the pharmacopœia, soluble meat, &c., of Messrs. Southall, Bros., and Barclay, of Birmingham, whom he represented.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 3, 1879.

BACON'S INFLUENCE ON SCIENTIFIC DISCOVERY.

Readers of Professor Draper's work on "The Intellectual Development of Europe" must remember how that writer inveighs against the unmerited praises which posterity has lavished upon the author of the "Novum Organum." Professor Draper goes so far as to say that Bacon was, from a scientific point of view, little better than an impostor; that he was not acute enough to appreciate the magnitude and the utility of the scientific discoveries made in his own day, and that the great reputation which his scientific writings have earned for him might more justly be claimed for his predecessor and namesake Roger Bacon. Similar, though less severe, reflections have been recently made by our excellent contemporary the *Guy's Hospital Gazette*. Bacon's influence, remarks the writer, was really popular, and not scientific. "We shall find him great, not for teaching the art of discovery, but for strengthening and spreading abroad those habits of mind which were familiar enough to such men as Galileo and Harvey, but were as yet strange to most of their contemporaries. As a matter of universal experience, men do not discover by rule. Kepler, and Copernicus, and Galileo were not led by any systematic method. The discoveries of modern times owe nothing to the systematic expositions of scientific processes of Sir J. Herschell, Whewell, and Mill, and we cannot doubt that the discoverers of Bacon's day were equally independent of rules." The writer goes on to say that the "Novum Organum" was not

Digitized by Google

so much admired by those scientific men who were actually engaged upon the study of nature, and who had then shown their independence of Aristotle, as by that large and increasing party in the Universities, who were just beginning to free themselves from the authority of the Greek philosopher. At the same time, he admits that Bacon's work was indirectly of the greatest value, and that, although comparatively ignorant of the sciences of his day, none proclaimed more clearly than Bacon, the nature of the problems of science and the spirit in which to meet them.

There can be no doubt that the disparaging remarks which have been made by Draper and others, with regard to the scientific aspect of Bacon's writings are for the most part just. We have too many instances of the fact that men may be more fortunate after than they were before death, and that often posthumous fame as much exceeds as it sometimes falls short of that which is deserved. Would, it may be asked, the memory of the great lexicographer, Dr. Johnson, be held in such high estimation at the present day had he not had a Boswell to write his life; and would Bacon's fame be so great, or his writings so frequently quoted, were it not that his great learning and eloquence have for ages attracted the admiration of a host of literary men and essayists who were incapable of questioning, or unwilling to question, his merits as an inductive philosopher. It is indeed strange that the apostle of the experimental philosophy should have altogether ignored the existence and work of Roger Bacon, whose "Opus Majus" may, says Whewell, for its wide views of the reform of philosophy, and the mass of solid knowledge which it contains, be considered as the *Novum Organum* of the fifteen century. It is strange, too, that he should have spoken so contemptuously of his contemporary Gilbert, who not only in his celebrated work "De Magnete" repeatedly asserts the advantages of the experimental over the *à priori* method of inquiry, but succeeded when his censor failed in giving a practical example of the utility of his precepts. Nevertheless, the faults which have exposed the reputation of Bacon to the attacks of modern critics are but trivial when compared with the merits of his teaching. Undoubtedly the great feature of the Baconian philosophy was the earnestness with which it exhorted all men to throw aside useless speculations, and to confine their attention to whatever tended to increase the happiness, or lessen the miseries, of mankind. That the elaborate scheme which he laid out with that object, and which is so eloquently developed in the "De Augmentis" and "Novum Organum," is not yet perfect, and not without a flaw, is no reason why we should withdraw our admiration for the general principles of his philosophy, and for the ever-valuable sayings and precepts that are to be found in every page of his writings. In fact, one of the great merits of Bacon's works is not so much that they actually teach men to be great discoverers as that they remind even great discoverers of the errors into which they are liable to fall in the course of their investigations. Hence there are few scientists of the present day who may not derive both pleasure and profit from a perusal of these works—who, indeed, would not be all the better for studying the "De Augmentis" and "Novum Organum" before entering upon a course of original research. Over and over again the scientific inquirer will come across precepts that will be of the greatest use to him in the prosecution of his studies. He will learn, for instance, how "method is the architecture of the sciences," and that (as we are told in another place) "when a man tries all kinds of experiments without method or order, this is mere groping in the dark; but when he proceeds with some direction and order in his experiments it is as if he were led by the hand." He will learn the value of "a diligent kind of doubting which is no contemptible part of knowledge." He will learn that, with regard to authority, "it is the greatest weakness to attribute infinite credit to particular authors . . . . for truth is rightly named the daughter of time, not of authority." He will be told that our wealth of literature is deceptive, and that, if any one "be inclined to admire the immense variety of books offered to his view," his astonishment will cease on examining their contents, being rather surprised "at the poverty and scarcity of matter which has hitherto possessed and filled men's minds." And, above all, he will be cautioned against falling into those errors which arise from prejudice and preconceived opinion, from one being too much absorbed in "some predominant pursuit," from "association of words and names," and the "re-action of words upon the understanding," from drawing conclusions from insufficient data, and other like causes of fallacious reasoning. In short, it would be wrong to deny the salutary influences which the study of Bacon's writings is capable of having upon the mind of those who propose devoting their time to original research, and especially those whose judgment is too much biased by the grand, but crude, speculations of modern science, We therefore trust that, however much Bacon's merits as a practical philosopher may be questioned, his aphorisms will not be allowed to fade from the memory of man, and that they who are engaged in the difficult task of medical discovery, will continue to regard him as a guide who, if he cannot lead them to the desired goal, can, at least, point out the pitfalls into which they may stumble on their way.

THE LUNACY LAWS.

It is doubtful whether the public will be satisfied with the observations which the Commissioners in Lunacy have made on the report of the select committee of the House of Commons which last year inquired into the operation of the lunacy laws. "We are not disposed," they say "to advocate any radical changes in the existing law regarding the care and treatment of the insane, and in particular, so far as our present experience extends, we are quite satisfied that the present system of certification, both of private and pauper lunatics, and of visitation of the asylums, hospitals, licensed and unlicensed houses where they are received, affords, in practice, ample safeguards as well as against the admission of persons of sound mind as for the discharge of insane patients without undue detention." Thus they are disposed to leave things much as they are. They certainly go on to note certain points where amendment would be useful, but virtually they would have the lunacy laws remain much the same as they are at present. But there is an impres-

Digitized by Google

sion among the public, and even among writers in the daily press, that the general principle which governs the drawing up of medical certificates of lunacy is a bad one, and it is a question whether greater deference should not have been paid to public opinion in this matter, especially as cases now and then occur which not only show that there are some grounds for this popular suspicion, but that the authorities would be justified in making a complete change in the system at present adopted. Only a short time ago a commission of lunacy has been inquiring into the case of a Mr. Dicker, a gentleman of some means, who was accused of being a lunatic and incapable of managing his own affairs. Several medical men attested that he was insane, and several witnesses made various allegations, scarcely one of which proved anything more than that he was very eccentric. On the other hand, medical experts came forward and declared that Mr. Dicker was not insane, while a bank manager and other witnesses, proved that he was quite able to manage his own monetary affairs. Moreover, the examination of the gentleman himself was satisfactory, and after a sitting of three days, a verdict was returned in his favour. Two or three years ago we were ourselves called to see a patient who had become a sort of dipsomaniac, and whose husband was so determined to get her into an asylum, that at last he got two medical men to sign a certificate of lunacy against her. Fortunately, they soon saw their mistake, and the certificate was withdrawn almost as soon as it had been written. The husband still persisting, an eminent expert was called in, who at once decided in the lady's favour, and so the matter ended. Now these are just the cases which prejudice the public mind against the system now adopted previously to the admission of a patient into a lunatic asylum, and which induce writers in the daily press to talk of persons being, "through the aid of accommodating doctors, packed off to an asylum by designing relatives, where, if they are not already insane, they soon become so." Indeed, the present law which allows a patient to be sent to an asylum merely on the certificates of two medical men is decidedly objectionable. We admit, that as a rule, the medical profession consists of upright and honourable men, but then there are exceptions, as there are in the case of every other profession, and the public should be protected as much as possible from those whose ignorance or bad principles would, if unchecked, further the designs of wicked relatives. Besides, the signing of a lunacy certificate is a responsibility which should not be thrown upon the shoulder of any medical practitioner, and generally speaking, medical men are very glad to shirk a practice which while it is of very little profit to them, may give them a good deal of trouble and annoyance. There are several ways in which the present plan might be altered for the better. But leaving this subject for another occasion, we would only now express our regret that the Commissioners in Lunacy have not thought proper to do something more than make a few trivial suggestions with regard to the amendment of our lunacy laws.

The will of Dr. Charles Radclyffe Hall, of Torquay, has been proved under £90,000.

THE HEALTH OF DUBLIN.

The return for the week ending August 23rd shows an exceptionally healthy condition of Dublin. Therefore we shall not be considered as selecting an exceptionally bad week with the desire to make a case against Dublin sanitation. The mortality of the week was only 22·8 per 1,000 of the population, and—with one exception—the number of deaths has not been so low for over twelve months. We owe this apparent healthiness to an accidental decrease in the registration of diarrhœa deaths, which reduced the zymotic deaths nearly 30 per cent. But in spite of this fortunate circumstance Dublin was yet much more unhealthy than other large towns. Against its 22·8 stands a mortality of 19·1 in London—17·2 in Glasgow, and only 15·2 in Edinburgh.

Let us see, moreover, how many lives the neglect of sanitation in Dublin has cost its citizens within so brief a period as six months. Here is the statement for each week from March 1 to August 23 :—

Week.	Deaths each week this year.	Average of same week ten years.	Increase above average.	Decrease below average.
March 1	185	182	3	—
March 8	191	187	4	—
March 15	183	189	—	6
March 22	180	198	—	18
March 29	208	209	—	1
April 5	230	155	75	—
April 12	165	168	—	3
April 19	184	178	6	—
April 26	190	177	13	—
May 3	204	179	25	—
May 10	152	178	—	26
May 17	188	170	18	—
May 24	217	185	32	—
May 31	164	170	—	6
June 7	207	178	29	—
June 14	203	183	20	—
June 21	224	173	51	—
June 28	239	190	49	—
July 5	206	157	49	—
July 12	194	162	32	—
July 19	195	167	28	—
July 26	178	158	20	—
August 2	153	151	2	—
August 9	201	175	26	—
August 16	202	171	31	—
August 23	192	161	31	—
Total increase			544	60
Deduct decrease			60	
Balance of excess of mortality			484	

Here—beyond dispute—are nearly 500 souls lost within six short months over and above those which would probably have succumbed in former years *in Dublin*, and—be it remembered—what that phrase means. It means that ordinarily and every year the mortality in Dublin is greatly higher than that of other cities, and that—in this year—its mortality is more than 1,000 above that excessive amount. Are we unreasonable in asking how it can be that neither Corporation sanitarians, newspapers, Government officials, nor citizens think it worth while to rouse themselves to the consideration and active remedy of such a state of things? Can there be any excuse whatever for the culpable delay in entering upon the Government inquiry asked for nearly two years ago, and granted six months since? Are the citizens of Dublin to be allowed to die at the rate of 1,000 in each year awaiting the convenience of Colonel Rawlinson, or some unhoped-for activity on the part of the Corporation Public Health Committee?

STATISTICS OF MEDICAL QUALIFICATION AND REGISTRATION.

The Half-Yearly Medical Register, which has just been issued, under the supervision and editorship of Mr. Miller, the Registrar of the General Medical Council, bears evidences of the determination of its editor, not only to minimise the errors of the Register, but to make that roll of practitioners useful as a basis from which important statistical information may be deduced. We cannot hesitate to congratulate the profession and the Medical Council upon the obvious disposition of its chief recording officer to step outside the narrow circle of his official functions, and devote himself to the codification of information, the collection of which will greatly aid a due understanding of the questions now at issue in connection with medical reform. The tables which precede the Half-Yearly Register refer firstly to the registration within the half-year which ended on the 1st of July; and, secondly, to the complete roll of registrations contained in the 1879 Register.

From the six months' list of names and qualifications much interesting information may be deduced. Within that period 267 persons entered their names within the United Kingdom as qualified practitioners. Of these nearly one-half (41·7 per cent.) possessed only a single qualification; but of the other half (58·3 per cent.) the greater majority will no doubt obtain one or more additional diplomas at some future period, but we find that, of the whole number of practitioners now on the Register (22,564), about one-fifth (19·33 per cent.) content themselves with a single diploma, and are engaged in practice on the strength of that one qualification. This is a fact deserving of the consideration of the Select Committee, because we all know that there is not granted in the United Kingdom any one diploma or degree which can be accepted as a guarantee of competency in all branches of medical study, and it is notorious that, as a rule, a single diploma only infers education and examination in one section of medical education, and that certain licensing bodies purposely confine them to the subjects which they conceive to be their own specialty, proceeding on the perfectly unjustified assumption that the student will be called upon to answer elsewhere in the subjects which it neglects. For instance, one licence which may be, and is, registered as a full and perfect title to practice entirely ignores surgery, both in its curriculum and its examination, while another, intentionally excludes midwifery and gynæcology from its examination. The insufficiency of any single diploma as a guarantee of medical competency is, indeed, so fully understood that most public bodies refuse to accept one qualification as sufficient, and the Irish Local Government Board insists upon an additional midwifery diploma being held by its officers. It is, therefore, a serious matter, and a fact which, *per se*, would justify conjoint examination, that, as shown by Mr. Miller's statistics, one half of those who enter practice do so though they have been tested in only one division of medical knowledge—licentiates may and do pursue medical practice, and act in a public capacity, for a period which is absolutely at their own discretion, before they are examined in the remaining divisions of their professional education—and that one-fifth of the whole profession continues in the pursuit of such semi-qualified practice, and are actually engaged in the daily treatment of disease which they may never have troubled themselves to learn, and respecting which their knowledge has never been tested.

Further testimony may be derived from this part of the Registrar's tabulation as to the excellent effect which may be expected to ensue from conjoint examination in this direction. We have said that 41 per cent. of the medical men recorded in the six months' Register possess only one diploma; of these the greater number hailed from England, where the single and double diploma holders for this period were practically equal in numbers—a circumstance which arises, doubtless, from the absence of any intimate relation between the licensing bodies which grant the separate diplomas. In Ireland, we hope, such a relation exists, for the University grants separate surgical and medical degrees within its own walls, and affords great facility for the taking of both degrees at the same time, while there is, between the Colleges of Surgeons and Physicians a co-operation as close as that between the London College and Hall. Therefore, in Ireland, the single diploma practitioners are only as 35 to 64, while in England they stand as 48 to 51.

In the Scottish statistics the effect of the double diploma or conjoint examination system is obvious. In that country only seven persons registered a single diploma out of 53 within the half-year; the single diploma holders being only in the proportion of 13 to 86. These figures teach us that even when single diplomas are freely open to students they will always prefer to take the double qualification, and that the effect of placing even a voluntary conjoint examination at the disposal of students is to secure for the public advantage the benefits of a complete guarantee of competency in all branches of professional knowledge.

As to the relative share of each of the licensing bodies in the work of medical qualification, some information may be derived from another of Mr. Miller's table. Out of each hundred candidates admitted to the profession the

London R. C. S. examined ...	(say) 41·0
London Apothecaries' Co.	28·0
Edinburgh R. C. S.	17·0
Dublin R. C. S.	12·0
Irish College of Physicians	21·0
Glasgow Faculty	72·4
Dublin Apothecaries' Co.	1·3
Oxford and Durham	0·0

All other qualifying bodies varying from 3 to 0·3

These figures must not be taken as an absolutely reliable representation of the proportionate work of each licensing body in medical qualification, because the apparent proportion of examinations held by each will vary according to the time of year in which the examination is held, but it is sufficient to show that many of the licensing bodies which have as loud a voice in medical affairs as any other are altogether insignificant as contributors of medical men to the public service. This fact bears forcibly upon the proposition of the Medical Alliance Association incorporated in Dr. Lush's Bill, to the effect that many of the existing licensing bodies should send a representative to the Medical Council only in common with some other

Digitized by Google

body, and that, by this means, the number of the Council should be reduced.

We again commend Mr. Miller's tables to the careful study of medical reformers.

Notes on Current Topics.

The London Water Supply.

Colonel Bolton, the water examiner, and Professor Frankland, report of the London water that "taking the average amount of organic impurity contained in a given volume of the Kent company's during the nine years ending December 1876 as unity, the proportional amount contained in an equal amount of water supplied by each of the Metropolitan water companies and by the Tottenham Local Board of Health was :—Colne Valley 1·3, Kent 1·4, Tottenham 1·8, New River 4·5, Chelsea 4·8, Lambeth 5·6, East London 6·2, Grand Junction 6·5, Southwark 6·6, and West Middlesex 6·7.

The Thames water delivered by the Chelsea, West Middlesex, Southwark, Grand Junction, and Lambeth companies, was much polluted by organic matters and was not fit for dietetic use. The West Middlesex company's water was also slightly turbid and contained moving organisms.

The Lea water distributed by the New River and East London companies was but slightly better, and the New River water was slightly turbid owing to suspended crystals of carbonate of lime.

The deep well water delivered by the Kent and Colne Valley companies and by the Tottenham Local Board of Health has not been affected by the heavy rains. It was as usual, clear and bright, and of excellent quality for dietetic purposes.

Seen through a stratum two feet deep, the waters presented the following appearances :—Kent, Colne Valley, and Tottenham clear and colourless ; Southwark, Grand Junction, Chelsea, Lambeth, and East London, clear and pale yellow ; West Middlesex and New River, slightly turbid and pale yellow.

Overcrowding in Past Times.

Judging from some information which the *Builder* has derived from a series of books, entitled the "Remembrancia," and preserved in the Record Room of the Town Clerk of London, our ancestors were not quite so oblivious to the sanitary condition of their surroundings as we are apt to imagine. The endeavours to prevent overcrowding, indeed, to prevent any addition to the number of inhabitants, appear to have been continuous. Dated October, 1632, there is a petition to the Lords of the Council, complaining of the multitude of newly-erected tenements in Westminster, the Strand, Covent Garden, Holborn, St. Giles's, Wapping, Ratcliff, Limehouse, Southwark, and other places, which had brought great numbers of people from other parts, especially of the poorer sort, and was a great cause of beggars and other loose persons swarming about the City, who were harboured in these out-places. That by these multitudes of new erections the prices of victuals were greatly enhanced, and the greater part of their soil was conveyed by the sewers in and about the City, and so fell into the Thames, to the great annoyance of the inhabitants and of the river. That if any pestilence or mortality should happen, the City was so compassed in and straitened with these new buildings that it might prove very dangerous to the inhabitants. They, therefore, prayed the Council to consider the great inconveniences of these new erections, and to petition to the king that some restraint might be had.

Treatment of Opium Poisoning by Atropine.

It is satisfactory to observe that cases now and then occur which seem to show the antidotal effects of atropine in poisoning by opium. In a recent issue of one of our contemporaries, a case is recorded in which the patient had taken 6 drachms of the tincture an hour before his admission to the hospital. Sulphate of zinc failing to produce vomiting, the stomach-pump was used, and by it 12 ounces of brownish fluid were withdrawn. Notwithstanding strong coffee and other remedies were tried, his condition became worse, when one-tenth of a grain of sulphate of atropine was injected. Immediately improvement took place, and continued for about 10 hours, after which there was a relapse. The farther injection of one-fourth of a grain caused a slight improvement, but there was no return of consciousness. After an interval of half-an-hour, the respiration suddenly sank to 12, but rose again to 20 after artificial respiration had been kept up for about 10 minutes. From this time the patient slept for about 15 hours ; attempts made to rouse him, being only partially successful. On awakening he was able to answer questions put to him, and soon recovering left the hospital. In this case the good effects of the atropia were not so apparent as they have been in other cases, and no doubt in some instances it is difficult to say how far the recovery has been due to the action of that drug.

The Weather and the Death-rates.

According to the Registrar-General's returns for this week ending August 23rd, the annual death-rate in London from all causes, which had been equal to 17·6 and 19·4 per 1,000 in the two preceding weeks, was 19·1. During the past eight weeks of the current quarter the death-rate in London has averaged but 18·1 per 1,000 against 20·2 and 24·1 in the corresponding eight weeks of 1877 and 1878. The rates of mortality in the twenty large English towns were also remarkably low, ranging from 13 per 1,000 in Portsmouth to 21 in Salford.

It must not, however, be inferred from these low death-rates that the health of the adult population has been the better, for the extraordinary wet, cold, and sunless weather that has prevailed all this summer. In the first place there are many complaints and functional derangements of the system induced by the prevalence of wet weather, which are not necessarily fatal, and which consequently would have no immediate effect upon the death-rate of the population. In the second place, we have the very significant fact that "the low rate of mortality in recent weeks has been mainly due to the unusually slight fatality from infantile diarrhœa." The deaths from diarrhœa, which had risen from 25 to 127 within four preceding weeks, further rose to 174 last

Digitized by Google

week, but were 73 below the corrected average for the corresponding week of the last ten years. Hence the effects of the very hot and dry weather which usually prevails towards the end of the summer are chiefly felt by infants and young children, and hence when we have a cold and very wet summer, the diminution in the general death-rate is owing to the exemption of that class from those maladies to which they are so liable during high ranges of temperature. On the other hand, so great is the total annual mortality among children under five years of age that any conditions which specially and injuriously affect their healths will very soon swell the infantile mortality, and consequently so increase the general death-rate as to lead to the belief that the health of the community at large is worse than it really is.

The Chloride of Ammonium with the Perchloride of Iron.

In the current number of the *Practitioner* Dr. T. Grainger Stewart draws attention to two points. First, that in certain cardiac cases, particularly those in which aortic valves are diseased, a peculiar condition sometimes arises which demands for its treatment large doses of iron. Second, that in some cases, both belonging to the above group and of other kinds, the reception of iron by the system is greatly facilitated if chloride of ammonium be administered along with it. The condition to which Dr. Stewart alludes is that so frequently seen in heart disease, namely, general poverty of blood, great debility, cerebral anæmia, giddiness and general distress, symptoms for which physicians have been long in the habit of prescribing ferruginous tonics. The combination, however, of the tincture of the perchloride of iron with chloride of ammonium is a good suggestion, which is worth making a note of. Dr. Stewart finds that when, during the administration of iron, functional derangement of the stomach and liver set in, with furred tongue, impaired appetite, headache, &c. — these symptoms rapidly disappeared after adding half a grain of ammonium to each minim of the tincture. In this way he has been repeatedly enabled to administer iron in large doses to patients who could scarcely have otherwise taken it. This combination is also particularly serviceable in cases where the liver or spleen is enlarged.

Advice to Bathers.

With the view of diminishing the number of deaths which annually occur at this season of the year from incautious bathing, the following notice has, by order of the Royal Humane Society, been issued by the Secretary, and distributed throughout the United Kingdom: "Important to bathers.—Avoid bathing within two hours after a meal. Avoid bathing when exhausted by fatigue or from any other cause. Avoid bathing when the body is cooling after perspiration. Avoid bathing altogether in the open air if, after having been a short time in the water, there is a sense of chilliness with numbness of the hands and feet; but bathe when the body is warm, provided no time is lost in getting into the water. Avoid chilling the body sitting or standing undressed on the banks or in boats after having been in the water. Avoid remaining too long in the water, but leave the water immediately there is the slightest feeling of chilliness. The vigorous and strong may bathe early in the morning on an empty stomach. The young and those who are weak had better bathe two or three hours after a meal; the best time for such is from two to three hours after breakfast. Those who are subject to attacks of giddiness or faintness, and those who suffer from palpitation and other sense of discomfort at the heart should not bathe without first consulting their medical adviser."

Remedies in Tetanus.

In the last number of Schmidt's *Jahrbücher*, Dr. Knecht closes a long review of the recent treatment of tetanus. He finds that the plans adopted give the following result:—

By means of *surgical measures* (nerve stretching, excision, &c.), of 58 cases treated 28 died; mortality 48 per cent. 51 cases were treated with *curare*, of which 26 died; mortality 49 per cent. 60 cases were treated with *calabar bean;* of these 27 died; mortality 45 per cent. 134 cases were treated with *chloral* alone, of which 55 died; mortality 41 per cent. To these add 23 cases treated by combining chloral either with bromide of potash, morphia, cannabis indica, or belladonna, with only 4 deaths, and the mortality is 37 per cent. 63 cases treated in various other methods (belladonna, baths, jaborandi, opium, expectant method, &c.) gave 31 deaths; mortality 49 per cent.

From this exhaustive study he reaches the conclusion that *chloral*, especially in combination, should have the decided preference in the treatment of this formidable complication of wounds.

Enemata of Chloral in Sick Headache.

Dr. J. Seure (*Bulletin Gen. de Therap.*) recommends this treatment very highly. He says that a patient of his (a lady), who is subject to severe attacks of migraine after shopping, &c., is accustomed, on her return home, to take an enema consisting of a glass of warm water, with a tablespoon of the following mixture: ℞ Chloral, gr xlv.; aq. destillat., f. ʒ x.: M. Within a few *seconds* she begins to taste the chloral in her mouth, and, at the same time, she experiences a sensation of numbness. Little by little the headache disappears, nausea is allayed, and half-an-hour later nothing remains but a slight discomfort in the head, with a little torpor.

In this case twenty grains of the chloral are enough, but in the case of men thirty to forty grains are required. Dr. Seure has noticed that the relief gained is more prompt if a tablespoonful of brandy or whisky is added to the enema. Dr. Seure regards this treatment as almost infallible for the arrest of an attack of sick headache, and as decidedly preferable to the administration of remedies by the mouth. It has the advantage of not disturbing the stomach.

A Satire on Mechanical Improvers.

A most amusing satire appears in the *Louisville News* on the method of obtaining notoriety adopted commonly by a certain class of surgeons, i.e., to make some useless or

Digitized by Google

injurious modification of a well-known instrument, and give the modification a new and incomprehensible name, and publish the affair in a sixpenny pamphlet with great emblazonment of the "inventor's" titles, and a record of cases cured by the use of his instrument.

The satire is in the form of—"An Account of the Perineosinuexerecinator. By Jacques Robinson, A.M., M.D.; Surgeon to the Hospital for Ruptured Vesicles; Member of the Anteversion Society, and of the Round Ligament Club, &c., &c." The author, with the usual "pomp and circumstance," recounts the history of the common probe, first proposed "by the eminent gynæcologist Dr. Smith, of Jonesville," and narrates the subsequent modifications of it by various inventors, by making it a little longer, and turning it up at both ends. The originality of the "Perineosinuexerecinator" is that it differs from all former efforts of ingenuity by being turned up at one end and straight at the other.

Finally the author gives cases, after the manner of such inventors, of which the following is a specimen :—

"Mrs. A B., aged forty years, female, brunette, bilious temperament, native of Kentucky, residence in Louisville, 397 West 36th Street, north side (up stairs); married 4th of July, 1866 (no cards); three children, named respectively Thomas, Richard, and Henry; weight one hundred and twenty-three pounds (somewhat greater after eating).

"She states that her appetite is good when she is hungry, generally sleeps at night, and is about during the day. Had suffered the week previous to her visit to me with perineal furuncle, for which ordinary remedies had been used, and it had discharged. Suspecting a sinus had resulted, I made exploration with the smaller of my instruments, and verified my diagnosis. Sinus measured 2 centimetres in depth.

"R. Argent nit., to be used locally, and to take fluid ext. black haw. Cured."

Tobacco-Blindness.

The following are the conclusions at which Dr. Martin has arrived in his recent thesis for the doctor's degree regarding disorders of the eyes produced by tobacco: 1. It is easy to distinguish between amblyopia caused by alcoholic poisoning and by abuse of nicotine, as in both cases the affection presents characteristic symptoms. 2. The most important of these symptoms is the condition of the pupil, which is dilated in alcoholic amblyopia and contracted in the other case. In the first case the affection progresses irregularly and with occasional changes for the better, which are followed by relapses, while in the second case its progress is slow, but uninterrupted. In the one both eyes are always affected to the same extent; in the other, they are not both affected, or at least not simultaneously. The patients do not see as well at night as during the daytime, and do not suffer from hallucinations, illusions of sight, or diplopia. In alcoholic amblyopia, on the contrary, the patients cannot bear a strong light, see better during the night, and complain of hallucinations, polyopia, and diplopia. 3. Visual disturbances, when connected with poisoning by tobacco, are manifested under the following forms: *a.* binocular amblyopia; *b.* muscular amblyopia with central scotoma; *c.* amblyopia caused by both tobacco and alcohol.

Habitual Drunkards.

The Habitual Drunkards Act, which was passed last session to facilitate the control and cure of habitual drunkards, will come into operation on the 1st of January next. In the preliminary part of the Act it is laid down that an "habitual drunkard" means "a person who, not being amenable to any jurisdiction in lunacy, is notwithstanding, by reason of habitual intemperate drinking of intoxicating liquors, at times dangerous to himself, or herself, or to others, or incapable of managing himself, or herself, or his or her affairs." A "retreat" is stated in the Act to mean "a house licensed by the licensing authorities named by this Act for the reception, control, care, and curative treatment of habitual drunkards." No license shall be given to any person who is licensed to keep a house for the reception of lunatics. The Act gives to the justices of the peace in England and Ireland, and to the sheriff or his substitute in Scotland, power to hear and determine, under the Summary Jurisdiction Acts, an information or complaint under the Act. The justices are to have the power to send habitual drunkards to retreats; and persons may be admitted to retreats on their own application, and such applicants, after their admission and reception into retreats, unless discharged, shall not be entitled to leave the retreat till the expiration of the term mentioned in the application, provided that such term shall not exceed twelve months. Provisions are made for the inspection of retreats by an officer, to be styled the "Inspector of Retreats," and each retreat shall be inspected at least twice in each year. Power is given to the justices to permit an habitual drunkard confined in a retreat to live with any trustworthy and respectable person willing to take charge of him for a definite time for the benefit of his health. An habitual drunkard escaping from the person in whose charge he has been placed shall forfeit his license, and may be taken back to the retreat. Ample provision is made by the Act for the medical attendance and care of those detained in the retreats under orders made by the justices. The Act is a tentative measure, having to stand the test of ten years' experience as to its feasibility before it becomes a statutory Act.

Origin of Diphtheria.

Diphtheria is believed to have originated in Egypt more than two thousand years ago. It prevailed in Egypt and Asia Minor, to which it extended, during the first five hundred years, and hence was early called an Egyptian or Syriac disease. Having invaded Europe, the disease appeared in Rome A.D. 330, and, being highly contagious, in its fifteen hundred years' transit on the continent of Europe it affected mainly rural districts and garrisoned towns. It extended to Holland, in which it was epidemic in 1337; to Paris in 1576, and again appeared there in 1771. It prevailed more extensively in France in 1818 and 1835, and in England, the United States, and Canada from 1856 to 1860, and more or less ever since.

Choked by a Tooth.

Dr. Poulet, in his "Traité des Corps Etrangers," reviewed in *Lyon Med.*, mentions two cases in which death resulted from the fall of teeth into the larynx during

Digitized by Google

extraction. In both these cases the operations were performed under the protoxide of nitrogen. A short time since a sudden death occurred to a child seven years old, at Lyons, the dentist having removed a molar by means of the American forceps, from the grip of which it escaped during the struggles of the patient. During a deep inspiration it entered the larynx, and the child died instantly. This case may be compared with one which occurred to Poof. Rigaud, who had a child die under his hands while he was attaching the pins for a hare-lip. At the autopsy a milk-tooth was found between the lips of the glottis, which it completely obstructed.

Homœopathy Outdone.

A WRITER in the *Boston Journal of Chemistry* says that "he was called to prescribe for a child, supposed by the physician in attendance to be dying, the disease being diagnosed as cholera infantum. My prescription was *one ripe strawberry every hour till better*. The child speedily recovered. Three months after, I was asked to prescribe for another child aged eleven months. The disease this time was really cholera infantum. *One-half strawberry every hour proved a successful treatment*. This child had also been given up to die." Of course! the *modus operandi* of the remedy is obvious—a pottle of strawberries gives the gripes—*ergo* half a strawberry must cure them.—Q.E.D.

A New Convalescent Home.

THE new Convalescent Home recently erected at Meanwood, near Leeds, was opened on the 30th ult. by the Bishop of Ripon and Miss Beckett, of Somerby Park. The building will accommodate about eighteen children, and is pleasantly situated on the high road between Meanwood and Moortown, having a frontage to the south-east and west aspects. Besides the usual kitchen offices and outbuildings which are placed in the rear to the north, a dining-room with south and east aspects, and a day-room, with south and west aspects, are provided, on the ground-floor there is a matrons' room, storerooms, and other conveniences. The kitchen is placed in the rear of the dining-room, having a buttery hatch or window for serving purposes, and the matron's room has an inspection-window overlooking the day-room. Suitable dormitories are provided on the chamber-floor, also matron and servants' bedrooms, with inspection-windows overlooking the dormitories. A lavatory and bath-room with cold and hot water services, linen-room, &c., are also provided on this floor. Much attention has been paid to light and air, drainage, and the proper ventilation of all drains, soil-pipes, &c., and to providing ample superficial and cubic space to the day-rooms and dormitories, and other matters of detail necessary to render the Home healthy and comfortable. The building has been erected by the late Mr. Moxon, of Headingly, from the designs of Mr. John Birch, of John Street, Adelphi, London.

THE annual meeting of the French Association for the Advancement of Science is now sitting at Montpellier; M. Bardoux is president.

Death of Prof. Julius Klob.

THE Vienna University has lost by death one of its best sons. Dr. Julius Klob has just died, æt. 49, at Ischl, where he had gone for his recovery, after a short illness from typhus, or, as some say, from pyæmia. He was Professor Extraordinary of Pathological Anatomy, and also one of the most popular practitioners in Vienna. Perhaps he was the most distinguished of Rokitansky's pupils, whose assistant he was from 1855 to 1861. Medical science owes several works of great merit to him, foremost amongst which is his "Pathological Anatomy of the Female Sexual Organs;" and special attention should be paid to his "Pathologico-Anatomical Studies on the Nature of the Cholera Process," which details investigations on this subject of the highest importance.

The Birmingham and Glasgow Waters.

DR. HILL, the medical officer of health for Birmingham, reports that the water supplied to that town "was clear, but both the solid and organic impurity was again larger than in recent months."

Dr. Mills, F.R.S., of Anderson's College, Glasgow, reports that the water supplied to that city from Loch Katrine "was brown in colour and contained much suspended matter, together with a decided amount of iron."

To Hasten the Action of Quinine.

DR. STARKE (*Berliner Klin. Wochenschrift*) advises that before swallowing powders or pills of quinia a weak tartaric acid lemonade be taken. This procedure not only greatly accelerates the solution and absorption of the quinia, rendering its physiological action much more prompt, but also obviates that unpleasant gastric irritability so common after the administration of large doses of this drug.

The Influence of Intellectual Labour on the Development of the Cranium.

M.M. LACARSAGNE and Cliquet communicated to the *Societe de Medicine Publique, etc.*, the results of comparative measurements of the heads of various individuals, viz., 190 doctors in medicine, 133 soldiers who had received a rudimentary education, and 90 other soldiers completely illiterate:

The antero-posterior diameter averaged:

	Doctors.	Soldiers, educated partially.	Soldiers illiterate.
	85·29	81·97	79·13
Frontal	48·91	43·65	42·35
Parietal	52·58	49·66	50·27

Moreover, the two halves of the cranium are not symmetrically developed. In the educated the left half is most developed, and in the uneducated the right half. They conclude:

1st. The cranium is more developed in the educated than in the uneducated.

2nd. In the educated the frontal region is relatively more developed than the occipital region.

Cantharidin from the Potato Bug.

IT appears from some experiments detailed in the Ameri-

Digitized by Google

can *Journal of Pharmacy* for June, that the fresh powder of the potato bug yields about one one-third per cent. of pure cantharidin. This is a large product, and no doubt these pests will be increasingly used as a cheap source of this valuable remedy.

THE *Rochester and Chatham Journal* gives currency to a statement that at Fort Pitt Hospital, Roshester, where the sick soldiers from Chatham garrison are taken, the men are dying at the rate of seven a week, the principal causes of the mortality being typhus fever and dysentery. The victims have been chiefly recruits. Dr. J. B. Jaedine, medical officer of health of Chatham, contradicts the above report, and states that there have not been any deaths from either of those maladies for years past, and only three fatal cases, during the last two months, of consumption, heart disease, and pneumonia.

THE fity-second meeting of the German Naturalists and Physicians, the parent of the now numerous tribe of scientific congresses, is to be held, under the presidency of Prof. Baumgärtner, at Baden-Baden, from September 18 te 24. Besides the work to be done in the very numerous sections, addresses will be delivered uy Profs. Baumgärtner, Kussmaul, Hermann, Birch, Hirschfeld, Ecker, Göltz, Jäger, &c.

WILLIAM EMERSON BAKER, a citizen of Boston, America, offers 200,000 dollars to the Public Health Association of that city, on condition that half as much more be contributed by others. The association is devoted to investigation as to house ventilation and drainage, the sale of adulterated and otherwise unfit food, and general questions concerning health.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

DEATH-RATE OF GLASGOW.—The deaths in Glasgow for the week ending the 23rd August, were at the rate of 17 per 1,000 per annum, against 15 in the preceding week, and 20, 20, and 19 in the corresponding weeks of 1876, 1877, and 1878. The rate of 15 per 1,000 is about the lowest ever recorded.

REGISTRAR-GENERAL'S RETURNS.—The weekly return of births, deaths, and marriages in the eight principal towns of Scotland for the week ending Saturday, August 23rd, says: The death-rate in the eight principal towns during the week ending with Saturday, the 23rd August, was 17·1 per 1,000 of estimated population. This rate is 13 under that for the corresponding week of last year, but 1·8 above that for the previous week of the present year. The lowest mortality was recorded in Greenock, viz., 10·1—and the highest in Paisley, 32·9. The rate in Leith was 32·7. The mortality from the seven most familiar zymotic diseases was at the rate of 2·6 per 1,000, being 0·8 above the rate for the previous week. The increase occurred chiefly in scarlet fever, whooping-cough, and diarrhœa. In Paisley, 5 deaths or 16 per cent. of the mortality of that town were caused by scarlet fever. Acute diseases of the chest caused 72 deaths, being 14 above the number recorded for the previous week.

HEALTH OF EDINBURGH.—The mortality in Edinburgh for the week ending the 23rd ult., amounted to 61 deaths, or a death-rate of 15 per 1,000. There was only one death from fever. The rest of the zymotic diseases were due to whooping-cough.

PAISLEY BURGH POORHOUSE AND ASYLUM. — At the monthly meeting of the members of the Burgh Parochial Board held on the 25th ult., the Asylum Committee's meetings bore that they had agreed to ask the Board of Lunacy whether, in the event of their appointing a resident medical man, they would sanction the house being utilised to the full extent of its accommodation—viz., for 150 inmates. They had further resolved to ask the permission of the Board to remove some harmless female patients to the poorhouse, in consequence of the present overcrowded state of the asylum. The asylum license, it was stated had been transferred to the new superintendent, Mr. Scrimgeour. The report on the institution by Dr. A. Mitchell. commissioner in lunacy, of July 7th was read. The present population of the house consisted of 117 persons (the license being only for 99), and the report recommended a reduction of the number as quickly as possible by the removal of some of the boarders to other establishments. Since the doctor's previous visit there had been 24 admissions, 10 discharges, and 5 deaths (males). Of the 10 inmates discharged, 7 were reported to have recovered. No fewer than 7 accidents had happened in the same period, 1 of them attended with fatal results. The health of the inmates was anything but satisfactory, and the reporter accounted for this state of matters by the patients' dietary, the defective water supply, the overcrowded state of the house, the want of ventilation, and the absence of kindly and judicious superintendence. Dr. Mitchell animadverted in unusually strong terms on most of the above points, and with reference to the last, he remarked that it was unnecessary to say much about it, seeing a change in the superintendentship had now been made. He hinted, however, that further innovations might be beneficial, and concluded with the hope that the house, in spite of the past, had yet a good future before it.

ABERDEEN.—MEDICAL APPOINTMENT.—Mr. James Hutchinson Walker, M.A., M.B. & C.M. Univ. Aberd., has been appointed certifying surgeon under the Factory Act for the district of Friockheim, Forfarshire.

Correspondence.

MEDICAL REFORM.—DR. McKENDRICK'S ATTACK ON THE ONE-PORTAL SYSTEM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—A casual reference to Dr. McKendrick's recent address on the above subject, by me, in your issue of the 6th ult., has exposed me to the charge, by this gentleman, of making statements of an "ungenerous and misleading nature." I can assure the learned professor that I should exceedingly regret to deserve this censure, for the cause must be a weak one which requires such weapons of offence or defence. It is far otherwise with the question of medical reform; and I maintain that if Dr. McKendrick's address did not, his letter certainly justifies my representation of the position assumed by him with reference to the important question under consideration. If Dr. McKendrick's letter is remarkable for one thing more than another, it is a brilliant example of gratuitous assumption, transparent and feeble special pleading, and illogical deduction. The gravamen of the charge against the existing state of matters —and it is from this standpoint that Dr. McKendrick attacks the claimant reform—may briefly be stated to be that with nineteen licensing bodies, of which a large pro-

Digitized by Google

portion are teaching bodies likewise, the natural tendency is towards a downward competition in the personal interests of the bodies in question, which are enriched in proportion to the number of individuals they teach and qualify, and that in consequence of the operation of these very human interests, incompetent men gain admission into the profession. To remedy this condition, fair and open competition in the education of medical students is proposed, while it is reasonably contended as a corollary that it must be immaterial to the public where, or from whom, the education of medical practitioners has been obtained (and it was originally intended by the universities that it should be obtained from their graduates, *as graduates able to read their diplomas* may learn), *provided a sufficiently high order of excellence be ensured;* and it is further contended that under these circumstances at the present moment, the profession is supplied by members of preeminent culture to a limited extent.

In defence of the present system, Dr. McKendrick at once lays down the position that he "cannot admit that the public are in any way suffering from the present arrangements as to the admission of men into the medical profession." "I have seen no proof," he continues, "that unqualified men are admitted, &c." Now this is a point which the *ipse dixit* of an interested individual is not sufficient to decide; it is a question of evidence, and of the standard of competency taken; and I would assert with equal assurance that the overwhelming preponderance of professional and public opinion of any value supports a diametrically opposite conclusion, and that from my own personal knowledge of students, and the opportunity which I have had of estimating the value of their preliminary and professional education, that both are in a great measure lamentably defective; that the great bulk of medical men are but very sorry representatives of a liberal profession; and that the numerical factor at the universities and corporations is of so peculiarly personal a nature that the examinations implied to have been passed are a sham and a delusion. I could, from personal knowledge, substantiate this accusation, but will content myself with the mere statement.

"Thanks," says Dr. McKendrick, "to the interest taken in recent years in medical education, and to the visitation of members of the General Council, all the boards are keenly alive to the fact that their doings are scrutinised, and that they dare not pass men below a certain standard of excellence. To maintain this *healthy state* of things I would urge efficient supervision by the Medical Council, or failing that, giving the requisite guarantee of thoroughness in the examinations, I would support the proposal for a State examination on practical subjects passed subsequent to obtaining a diploma or diplomas from one or more of the medical authorities presently existing."

Now what is the clear rendering and purport of these sentences? An admission that there is a natural disposition to pass unqualified men; but that this is to be averted by supervision of the Medical Council, or State examination—that a new examination is to be superinduced to qualify men for practice; but that this "healthy state of things" can exist only, however, in conjunction with the bodies thus kept in check, for, marvellous to relate, the moment the State contemplates the exclusive licensing of medical practitioners, Dr. McKendrick objects, "because it tends towards a minimum standard of qualification, lower in all probability than the lowest at present existing in the United Kingdom." The State can effectually keep nineteen corporations in a "healthy state," but it will signally fail in keeping one or three corporations of its own in this desirable condition! On the one hand its supervision implies the maximum, or the other, the "minimum, standard." It would be interesting to be informed how Dr. McKendrick extricates himself from this peculiar dilemma.

Dr. McKendrick's second objection to the conjoint board or boards, is equally vague and illusory. It runs thus:—"Because it discourages the scientific culture and the training in various departments of natural science which have hitherto been one of the most striking features in the education of most medical men."

For such a statement as this, in its entirety, there exists not the shadow of foundation. It is an unsupported and visionary assertion, of which the writer has little reason to congratulate himself, and the best reply to it consists in simply indicating what the University of London has done, and is engaged in doing, towards elevating the social and scientific status of the profession. Has any member of the profession the foolhardiness to say, in perfect sobriety of intention, that the University of London has discouraged the "scientific culture, and the training in various departments of *natural science*," to which Dr. McKendrick professes so much attachment?

Dr. McKendrick's third allegation against the conjoint boards is that the system "will operate prejudicially on teachers, reducing them to the position of men simply training students for examinations, instead of leaving a man free to teach those views that seem to him to be the truth." The sense of this clause, if any exist, is not very apparent. What the position of a teacher is, and ought to be, other than to instruct students in departments on which they are expected to pass satisfactory examinations at the hands of men of undoubted competency, it is somewhat difficult to conceive. Whether is it more likely that truth shall be arrived at through the prelections of a man who teaches that by the knowledge of which, whether it be right or wrong, he qualifies students, and whose drivel, in many cases, is returned in parrot fashion, in order to obtain the coveted parchment, and flatter unbounded conceit, or through the instrumentality of a board of properly qualified men above the suspicion of personal motive or the gratification of personal fancy in the unfettered domain of science?

Fourthly, Dr. McKendrick pleads that "by favouring a minimum standard of qualification, and by discouraging men from connecting themselves with the literary and scientific culture of the universities, it will place medical men lower in the social scale than they are at present." What would be the result if the standard of qualification of the conjoint boards were as high as that of the Scotch universities; and is there any reason why it should not be so? As to the "literary and scientific culture" of the universities, I presume Dr. McKendrick to have in view the recent battle of the clinical chairs at the University of Glasgow—institutions more creditable to the commercial than to the scientific acumen of the city—the treatment which his predecessor in office received, and the "literary and scientific culture," begotten in pamphlet form as arising from these delectable professional tournaments.

Finally, the assertion is made by Dr. McKendrick that "in the selection of examiners to form the conjoint boards, there will in all probability be a new field for canvassing, testimonial giving, and intrigue, and in which party feeling of various shades will undoubtedly find place."

Dr. McKendrick, it will be noticed, deals largely with probability in argument, a habit, one would have supposed, strangely at variance with the "literary and scientific culture" of a university. Of the probability in question, what evidence exists? While past experience amply justifies the belief that on the occasion of the first professorial vacancy in any of our Scotch Universities, "canvassing, testimonial giving, and intrigue, and party feeling," will be fallen back upon as *heretofore;* and evidence is wanting that Dr. McKendrick's own appointment was unsullied by these shortcomings any more than those of his colleagues. If Dr. McKendrick be such a purist in the matter of professional preferment, should he not recognise that in "free teaching," to which he professes friendship, and a board of examiners who have no personal or selfish motives in qualifying candidates for the profession, the most effectual remedy for that which he deplores must of necessity exist?

With the remainder of Dr. McKendrick's letter I am not concerned. The corporations which he would annihilate must look after themselves. Such, then, are Professor McKendrick's amended views with reference to the conjoint board, for he ingenuously confesses that some years ago he was in favour of it; and in the light of them I confidently leave it to your readers whether the statement "that it seems he would approve, in short, of any scheme which would not disturb the monopoly of the universities, nor diminish the emoluments of the professors," is, after all, either "ungenerous or misleading."

I am, sir, yours, &c.,

"YOUR NORTHERN CORRESPONDENT."

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The letter by Prof. McKendrick in your issue of the 20th ult., gives some information about the one-portal system

Digitized by Google

and University teaching, of which, probably, many members of the profession had little previous idea. There can, surely, be nothing unfair in postulating that the promoters of this measure—the one portal—have not the least intention of levelling down; they may even be accredited with the notion that they *are* levelling up; their expectation being that the minimum standard of qualification will be one up, not down, to which the student must come; that this standard will be a guarantee for proficiency in general and professional knowledge, giving a dignified position to the successful candidate and perfect ground for public confidence. And surely they may be pardoned for the assertion that, instead of all this the result may be a level "lower, in all probability, than the lowest at present existing in the United Kingdom," involves a prediction for which something more than probability is required to ensure its respect, or even render it worthy of consideration.

That there is room for improvement in the existing state of things is, however, admitted; it may even be sharp and sweeping as in the case of the corporations, which "should have nothing to do with admitting men into the profession," but, in fact, we are to have King Canute acted over again, as the waves of reform may be allowed to travel till they touch the chairs of the Universities, and there must their course be stayed.

There is no need for interference here, the Universities are engaged in a "healthy state of things," which may be supervised by the Medical Council, or kept up to the mark by a State examination after a diploma had been "obtained" from one or more of the medical authorities "presently existing;" but all further meddling would be wrong, even although it should be difficult to understand how a State examination would tend to keep things right when exercised after a diploma had been obtained, yet would probably put them wrong if getting a diploma depended on its being passed. A State examination must, in the opinion of some people, be a queer affair; but of this, at all events, there can be no doubt—it would be entirely above suspicion as to passing students for the sake of fees, or making a school prosperous in numbers by dealing gently with ignorance, indolence, or incapacity. Literary and scientific culture may flourish perfectly under the influence of its demands, and will certainly command respect whether they have been prosecuted in a University or not. Teaching, instead of being hindered, should be stimulated; for teacher and student will be alike ignorant of what questions will form the subject of examination. While, so long as the medical profession takes any interest in the progress of science, teachers, who think they have some truth to tell in advance of what is known, will find a critical and appreciative audience, and certainly need have no fear of being cramped in their mental career by having for one hour a-day during six months of the year to tell a number of young men the truths they ought to know; these possibly being as much as they can learn in the time at their disposal, and haply of more importance than any special opinion, recount of experiment, or even individual discovery upon which their teacher might possibly be only too prone to dilate.

I am, &c.,

MEDICUS (Glasgow).

VIVISECTION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The able, logical, and vigorous address of Dr. Pye Smith, in vindication of the scientific pursuit of physiology, should not, I venture to think, be relegated to the archives of the British Association. It certainly deserves to be reprinted and distributed throughout the length and breadth of the land, for many reasons, but chiefly because of the utter ignorance that generally prevails on the question of so much importance, a sound knowledge of physiology, to the community generally and to the medical profession in particular in the successful treatment of disease. I would have a copy of Dr. Smith's address sent to our law makers, the members of both Houses of Parliament, since they evince great ignorance on the right method of teaching physiology, and therefore require educating on the subject; more especially so, because of the fact that, either from ignorance, supineness, or the love of killing in sport, not more than eighty members out of the eleven hundred and twenty-seven comprising the two Houses, could be found to vote against the barbarous cruelty of flaying men alive with the cat-o'-nine-tails; whilst a much smaller number neither uttered a word or voted against an Act which has placed science in fetters, and imposed a penal enactment upon an enlightened profession.

I would also have the address sent to all of those commonly termed the educated classes of society, because a large number of them have banded themselves together for the purpose of collecting money, which they lavish in a wicked and ignorant denunciation of certain members of our profession, and hindering the work of Christian charity.

As an example of the way in which Anti-Vivisection Societies impudently spend the money collected, several hand-bills have been found in my letter-box during the past fortnight, containing an urgent appeal to the subscribers and supporters of University College Hospital to withhold their support from this charity on the iniquitous ground that "Mr. Schäfer has just obtained a license to inflict torture upon animals." If we longer remain idle, or indifferent, we shall be a party to the grossest outrage and wrong that fools and hypocrites are bent upon inflicting upon the most useful and hardworking members of our profession.

We can, I think, no longer afford to treat the vivisection question with indifference. An association must be formed, and money collected, to print and distribute broadcast such addresses as those of Dr. Pye Smith and Dr. Andrew Clark; and means must forthwith be taken to counteract the craze of the *Anti-Vivisectionists*, and to obtain in the next Parliament the removal of any disadvantage of a public kind which impedes the progress of science. Any assistance I can render in the formation of an association for the purpose shall be freely and cheerfully given.

I remain, your obedient servant,

1 Bedford Square,
Aug. 27, 1879.

JABEZ HOGG.

Literature.

A TREATISE ON THE PATHOLOGY OF THE URINE. (*a*)

WE owe our author an apology for the delay which has arisen in noticing this work; but Dr. Thudichum's is a book which could not be skimmed over slightly. From a chemical point of view we believe that Thudichum's treatise leaves very little to be desired. While it presents itself as the result of a full and discriminating examination of the principal researches that have been made by chemists into the various constituents of normal and abnormal urine, it contains not a little to prove that Dr. Thudichum is no mere bookmaker, but that he has made the subject of which he treats a matter of patient thought and investigation in the laboratory. Many, indeed, of the practical manipulative details into which the author enters would be out of place in a work professing to be less than exhaustive. As it is, Dr. Thudichum places before his readers, in almost every case, not merely the general methods of separation, but even the minutiæ of analysis, which are so apt to escape all but specialists, and which are yet so necessary to success. In drawing attention, for instance, to the impossibility of effecting by means of alcohol a thoroughgoing separation of formiate and acetate of lead, he does good service, in as far as he impresses upon us the propriety of a healthy scepticism of much hand-book information that is too often accepted unchallenged. The book often, also, conveys its information with much liveliness and interest from the polemical tone which the author prefers to adopt. A good illustration of this feature is found in his defence of Seegen's position that sugar in normal urine is, for all we actually know to the contrary, a mere myth.

The book, with all its comprehensiveness of plan, and all its details of processes, calculation, and formulæ, is not, of course, altogether free from blunders. To expect so much would be to look for a miracle. The use of the word "manganese" for "manganese-dioxide" in the method for the artificial preparation of urea illustrates this charge, and though a bad enough error, it is nothing in comparison with the printer's error, which styles "Mosite" ($C_6 H_{12} O_6$) a "Hydrocarbon"

(*a*) "A Treatise on the Pathology of the Urine, including a complete Guide to its Analysis." By J. L. W. Thudichum, M.D. London: J. and A. Churchill. 1877.

Digitized by Google

instead of a "Carbo-hydrate." Such mistakes as these, we doubt not, will have vanished in a revised edition of the work.

The great wonder is that there are so few errors in such a labyrinth of formulæ as necessarily surround the most complex substances known to modern chemistry. At a first glance one might take exception, did he wish to be hypercritical, to certain parts of the nomenclature employed by Dr. Thudichum. A reader is startled when he first meets with "hydrothion in alkaline solution," and it is a moment or two before recognises his old laboratory "sulphide of ammonium." Nor is the author, to our thinking, quite consistent, for while he adopts a new family name for this sulphur-acid, we still find the $H_2 S_2 O_3$ called "hyposulphurous," instead of its now generally-accepted title of "theo-sulphuric."

There is noticeable in some parts an excess of detail, while in some, again, there seems a decided lack of it. For example, in giving the process for the estimation of urea by the evolution of nitrogen from urea by contact with hypobromite of soda, Dr. Thudichum omits to give the equation $CH_4 N_2 O + 2 Na Br O + 2 Na HO = 3 Na Br + 2 Na CO_3 + 3 H_2 O + N_2$. Indeed, considering that this, though not a thoroughgoing reaction is yet regular in its degrees of approximation, rapid in its operation, and much used now as the only handy clinical method sufficient for most practical purposes, we think our author is somewhat slighting in his treatment of it.

The volume is, on the whole, well up to date, although we still find the writer in the belief, in his chapter on ammonia, that it is impossible to catch the neutral point of a litmus solution by artificial light. It is possible, however, that the employment of a monochromatic light, such as that of a sodium salt (a method eminently successful) had not been mooted until after the publication of the work. It is only to be regretted that Dr. Thudichum did not give at the end of the work a more lengthy scheme for the systematic qualitative examination of urine. One which will be at once full and condensed is much required, and that which is given is too fragmentary to be of great practical value. For example, of what value is it to give the flame re-action to prove the presence of sodium? And why is no caution given in mentioning the reduction of the cupric-oxide of the "Fehling test" for sugar, that the practical student may guard against the possible presence of other reducing agents on which Dr. Thudichum, in the main body of his work, so properly dwells. Leaving, however, out of consideration these little imperfections and omissions, we can only say that the work is worthy of all respect as that of a man thoroughly read in his subject, and thoroughly conversant with its chemistry, theoretical and practical. As a chemical handbook on urine it is clear, exhaustive, and accurate, and will save the medical practitioner a world of trouble which he would otherwise have in ransacking chemical handbooks and the monographs of those who have striven in the laboratory to unravel the complexity of a substance into which is poured all the *débris* of the human body in health and in disease.

THE WASTING DISEASES OF INFANTS AND CHILDREN. (a)

[SECOND NOTICE.]

THE chapter on Inherited Syphilis is carefully written, and well worthy of study in conjunction with the recent article on Syphilis, by Baümler, in Ziemssen's "Cyclopædia of Medicine," Vol. iii.

It would exhaust the space of a review to discuss this chapter in detail, but we may mention here that in addition to epitomising the knowledge derived from the chief syphilographers of the past twenty-five years, Dr. Eustace Smith has enriched our knowledge by reference to the tenets of modern times as expressed by Bouchut, by Parroti; to the latter the author attributes originality in the discussion of dactylitis syphilitica and syphilitic dystrophia. Are we not, however, largely indebted to Professor R. W. Taylor, of New York, for much original research in connection with bone syphilis? No mention of his work, nevertheless, appears in relation to it, although Professor Taylor treats at length upon dactylitis syphilitica and the inter-dependence between rachitis and syphilis. The interesting researches of Elsässer upon the rate of closure of the fontanelles, which he finds to be especially retarded in rachitis, may serve to explain those cases of inherited syphilis in which the fontanelle is very widely open, unless, indeed, it be proven that this tardy closure is a more especial feature in inherited syphilis, pure and simple.

Pleurisy, also, is quoted upon the dictum of Mr. Hutchinson, to be a not uncommon cause of death in syphilitic infants; and here again, we want a series of carefully collected statistics, to show whether infantile pleurisy from simple non-specific, idiopathic causes, is not very frequent also as a cause of death. There is a need for great care in applying the *post hoc ergo propter hoc* argument in reference to specific diseases and their complications.

Among other authorities we notice the mention of interesting researches on this subject in connection with the names of Kassowitz, of Vienna, Chassagnac, Pacchioti, Hutchinson, Samuel Gee, and Coupland. In reference to treatment, the usual methods are detailed, but we fail to notice the mention of the combined treatment of mercury and Iodide of Potassium upon which Professor Taylor places so much reliance; nor does the mercurial vapour-bath, prescribed with such beneficial results in the secondary and tertiary syphilis of adults, by Mr. Henry Lee, meet with any notice in infantile syphilis; neither also do the recent researches by Mr. Buxton Shillitoe, upon the value of Sarsaparilla, which the late Mr. Holmes Coote extolled, appear within the pale of methods of treatment worthy of notice. Mercurial innunction, though noticed by the author, is not emphasised by him so fully as the investigations of our continental *confrères* would seem to warrant.

We pass now to the chapters on chronic pulmonary phthisis and the caseation of lymphatic glands. As the preface indicates, the former chapter incorporates the consideration of chronic tuberculosis, which, in an earlier edition, was treated of in a separate chapter. Dealing first with the relative value of the terms pneumonic phthisis, chronic tuberculous phthisis, and fibroid phthisis, the author passes on to the pathological differentiation between each and all of these. Then follows a good *resumé*, based on clinical observation, of the symptoms which may be observed during life. Useful hints upon the methods of examination to be employed are given, with appropriate information upon certain peculiarities which occur to modify the physical signs in childhood and infancy. After these, are discussed respectively the diagnosis, prognosis, prevention and treatment. This chapter is likely to prove useful to the student, and will reward perusal by the busy practitioner, who seeks a guide in conducting careful clinical observations. The almost universal use of the thermometer will perhaps explain the brevity with which its employment, for the differential diagnosis of the various forms of phthisis, is mentioned by the author.

As we regard the chapter on mucous disease of value in drawing attention to it, as an entity in disease; so too, we apprehend the author has done good service in devoting a separate chapter to the study of the caseation of glands. It is but too common a practice for authors to assume on the part of their readers a large amount of knowledge on special points; hence any effort which is made to give force and definition to special points in disease is worthy of careful consideration and merits support. This chapter deals in a clear and lucid manner with the process of caseation as it affects the lymphatic glands, and notes the value in a physiological and pathological point of view which attaches to the changes induced by caseation. A more detailed consideration then follows of the caseation of the bronchial and mesenteric glands respectively; the physical signs which accompany the change; points of interest associated with the diagnosis, and the appropriate special treatment.

In the concluding chapter the Diet Tables have been revised, and we cordially support the author in his plea for plain, minute and exhaustive directions, as well as for variety in reference to the feeding of infants and children in health and in disease. He has rendered no small service, to say the least, to students and junior practitioners by publishing these well-arranged diet tables.

We desire for the present edition an extensive circulation, and trust that the labour bestowed upon its production will secure for its author the thanks of the profession to which he is so justly entitled. It is a work of interest and of such merit as should secure for it a place in the library of every practitioner who realises the value of modern professional thought, and careful clinical observation, in reference to wasting diseases in infancy and childhood.

Medical News.

University of London.—The following gentleman have passed the first M.B. Examination :—

EXAMINATION FOR HONOURS.—ANATOMY—First Class: Edgar M. Crookshank (Exhibition and Gold Medal), King's College; William Lane (Gold Medal), Guy's Hospital: John Desmond Ernest Mortimer, Westminster Hospital. *Third Class:* Alfred Meeson, Liverpool Royal Infirmary; Joseph James Udale, Guy's Hospital (equal). *HISTOLOGY AND PHYSIOLOGY—First Class:* Thomas Harris, Owens College; William Eckett Fielden, Guy's Hospital. *Second Class:* William Lane, Guy's Hospital.

Growth of Drug Manufacture in America.—The *Scientific American* says that the manufacture of cream of tartar has so developed there that the imports of it from France have fallen in six years from 6,000,000 pounds yearly to none, whilst the price has been reduced from 32 to 24 cents per pound. In like manner the imports of citric acid from England have fallen from 250,000 pounds yearly to 27,000 pounds last year, the price having fallen to about one-half. In the case of borax the relations are even more completely reversed; for in consequence of the development of the borax mines in Nevada, England now appears as a buyer of crude and refined borax in the United States market, where she used to be the principal seller.

The Causation of Sleep.—The learned German alienist, Dr. Siemens, concludes that sleep is due to the activity of certain circumscribed parts of the brain, which form an inhibitory centre, and which are situated in the medulla oblongata, near to the convulsive centre. In support of this view, the connection between sleep and epilepsy is alleged, The inhibitory sleep centre stands in direct antagonism to the cerebral cortex; if the one is in a state of activity the other remains passive; the former can only exercise its function when the cortical substance is either inactive or nearly so. Sleep is much more easily induced in childhood, as the convolutions of the brain are at that time only partially developed, Sleep is also much more frequent and continuous when the cortical substance has degenerated, as in paralytic dementia; when its nutrition is faulty, as in anæmic conditions; also when it is to some extent paralysed by the action of hypnotics or by excessive cold. On the other hand, no sleep can be obtained when the cortex is in a state of activity, due to strong psychic impressions, excesses, alcoholism, or any form of mental disease. When, owing to some morbid condition, sleep has been absent for a length of time, the products of fatigue must have been generated in the body in large quantities, but still the hyperactivity of the cortical substance prevails and prevents the occurrence of sleep.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

G. A. MACNAMARA.—WE are making inquiry. Answer next week.

MR. FELLOWES.—1. Murchison's Fevers. 2. Masse's Anatomical Plates, with Bellamy's Translations. 3. Parkes's Hygiene.

A PROVINCIAL.—The various changes will be noted in our Student's Number. Our last year's Number is out of print.

DR. WILSON.—The publication is contemptible, we are surprised that a member of an honourable profession should allow his name to be connected with it.

MR. ENSOR.—If you will send the MS. we shall be happy to give you our views.

A MEMBER.—Not until November; the dates will be duly announced.

VACANCIES.

Alnwick Infirmary.—House Surgeon. Salary, £120, with furnished apartments, attendance, &c. Applications to the Hon. Sec. by Sept. 27.

Dreadnought Seamen's Hospital, Greenwich.—House Physician and House Surgeon. Salary, of the former, £76, of the latter £50, with board, apartments, and attendance. Applications to the Secretary on or before Sept. 10.

East London Hospital for Children.—Resident Clinical Assistant. Board, but no salary. Applications to the Secretary on or before Sept. 8. (See Advt.)

Leeds Union.—Medical Superintendent. Salary, £300, with an unfurnished house. Applications to be sent to the Clerk of the Guardians, East Parade, Leeds.

London Fever Hospital.—Resident Medical Officer. Salary, £200. Applications to the Secretary, Liverpool Road, Islington, before Sept. 6.

Royal Hants County Hospital.—House Surgeon and Secretary. Salary, £109, with board and lodging. Applications to be addressed to the Committee, under cover to the Secretary, before Sept. 10.

Westminster Hospital.—Pathologist and Curator of Museum. Salary, £52. Applications to the Secretary on or before Sept. 13.

APPOINTMENTS.

ALLNUTT, W., M.R.C.S.E., L.S.A.L., Public Vaccinator for the District of Westbury, Tasmania.

BALLANCE, C. A., M.R.C.S., Assistant House Surgeon to St. Thomas's Hospital.

CANT, W. J., M.R.C.S.E., L.S.A.L., House Surgeon to the Lincoln County Hospital.

COLGATE, R., F.R.C.S.E., L.S.A.L., Certifying Factory Surgeon for the District of Eastbourne, Sussex.

DAVIES, D. S., M.R.C.S., L.S.A., House Surgeon to St. Thomas's Hospital.

DAY, R. N., M.R.C.S.E., L.S.A.L., Medical Officer for the Harlow District of the Epping Union.

ELLIOTT, H., M.R.C.S.E., L.R.C.P.Ed., Medical Officer for the No. 6 District of the Maidstone Union.

FERNIE, A., M.R.C.S.E., L.S.A.L., re-appointed a Medical Officer of Health for the Barnstaple Rural Sanitary District.

GRIMBLY, R. H., M.R.C.S.E., L.S.A.L., Certifying Factory Surgeon for the District of Newton Abbot.

GROOMS, W. W., M.B., M.R.C.S., House Physician to St. Thomas's Hospital.

HALPIN, G. H., L.R.C.P.Ed., L.R.C.S.I., L.A.H.D., Certifying Factory Surgeon for the District of Wicklow.

HARTLEY, C., M.R.C.S.E., L.S.A.L., re-appointed a Medical Officer of Health for the Barnstaple Rural Sanitary District.

JACKSON, H., M.R.C.S.E., L.S.A.L., re-appointed a Medical Officer of Health for the Barnstaple Rural Sanitary District.

KERIGAN, L., L.R.C.S.I., Medical Officer to the Castletown-Geoghegan Dispensary, Mullingar Union.

LAKING, F. H., M.D., Surgeon-Apothecary to the Household of H.R.H. the Prince of Wales.

MORSE, R. E. R., M.R.C.S.E., a Junior Resident Medical Officer to the Royal Free Hospital.

NEWSHOLME, A., M.R.C.S., Assistant House Physician to St. Thomas's Hospital.

O'FARRELL, G. P., M.D., M.R.C.S.E., Certifying Factary Surgeon for the District of Boyle, co. Roscommon.

POPERT, A. J., M.R.C.S.E., L.S.A.L., Resident House Surgeon to the Southport Infirmary.

ROBINSON, A. H., M.B., M.R.C.S., Senior House Surgeon to the Hull General Infirmary.

SHAW, J., M.R.C.S., L.S.A., Assistant House Physician to St. Thomas's Hospital.

SHORT, W., L.F.P.S.G., L.S.A.L., Certifying Factory Surgeon for the District of Harrogate.

SMITH, R. P., L.R.C.P., M.R.C.S., House Physician to St. Thomas's Hospital.

TAKAKI, K., L.R.C.P., M.R.C.S., Resident Accoucheur to St. Thomas's Hospital.

WILLIAMSON, R. J., M.A., M.R.C.S., L.R.C.P., House Surgeon to St. Thomas's Hospital.

Births.

MACKESY.—On Aug. 25, at 47 Lady Lane, Waterford, the wife of George I. Mackesy, M.D., Mayor of Waterford, of a daughter.

SAUNDERSON.—On Aug. 26, at Mount Lucas, Phillipstown, King's co., the wife of R. Saunderson, M.D., of a son.

Marriages.

SHACKLETON—LEECH.—On Aug. 27, in Dublin, Edmund Shackleton, L.R.C.S.I., to Anna Maria (Nannie), daughter of Charles Leech, Esq., Q.C

Deaths.

BULL.—On Aug. 19, at Jersey, Martin Meggison Bull, M.R.C.P.L., aged 58.

FOX.—On Aug. 26, at 14 Harley Street, London, Mary, widow of Dr. L. O. Fox, and mother of the late Dr. Tilbury Fox, both of whom she survived but a few weeks.

GOOCH.—On Aug. 22, at Grove Hill, Ventnor, William H. Gooch, M.D. aged 68.

HAY.—On Aug. 23, at Christchurch, New Zealand, Dr. Thomas Bell Hay.

JAGOE.—On Aug. 21, at Bandon, Benjamin Hays Jagoe, M.R.C.S.E., aged 59.

JONES.—On Aug. 29, at Bryny Hynon, Dolgelly, Wales, Harriette Sophia, wife of J. E. Jones, M.D., aged 43.

MASON.—On Aug. 27, accidentally drowned at Hampton Wick, J. Wood Mason, son of J. Wood Mason, M.D., M.R.C.S., of Calford Bridge.

THOMAS.—On Aug. 24, John Henry Thomas, M.D., M.R.C.P., &c., of Cyfarthfa, Merthyr Tydfil, aged 48.

WILLIAMS.—On Aug. 15, at Denbigh Evan Pierce Williams, M.D., aged 49

IRISH POOR-LAW INTELLIGENCE.

ABSTRACT OF ANNUAL REPORT OF THE LOCAL GOVERNMENT BOARD FOR IRELAND.

MAY IT PLEASE YOUR GRACE,

WE submit to your Grace this our Seventh Annual Report under "The Local Government Board (Ireland) Act, 1872."

In 1876 and 1877 we noticed a decrease in the average daily number of workhouse inmates for two years in succession. In 1878 we were called on to report a change in the other direction; the average daily number of inmates being 1,441 more than in the preceding year, attributable to the indifferent harvest of 1877, and to the inclemency and wetness of the subsequent season. In the present report the average daily number of inmates shows an increase of 3,318 over that of the preceding year.

The out-door relief lists at the same periods show an average daily number of 36,274, in comparison with 33,547 in the previous year, showing an increase of 2,727.

The latest returns show in regard to the workhouse inmates a difference of only 2,267 betweeh the present and the past year, at the close of the corresponding week; but, on the other hand, a difference of no less than 4,404 between the numbers on out-door relief in 1878 and 1879, exceeding considerably the difference between the average daily number in the two years respectively.

The excess of the number of recipients of relief in the present year strikingly confirms our repeated observations, that under the existing Irish Poor-law fluctuations in the extent of the relief afforded, are mainly due to the character of the seasons, and this law of fluctuation presents itself systematically, not only as between the different portions of each succeeding year, but likewise between one year and another year, according to its character, as affecting the general health and condition of the population.

If the exceptional severity of the winter had been attended by no increase in the number of workhouse inmates, and by no increase in the number of persons receiving out-door relief, the Irish Poor-law would have failed to exhibit that elasticity and adaptation of itself to the circumstances of the country which has been for twenty-five years its most striking characteristic; while, on the other hand, there is abundant ground for satisfaction that a year almost unexampled for the length and severity of the winter season has produced so little strain upon the resources of the Poor-law Unions. It is further satisfactory to reflect that the increased cost of out-door relief, viz., £8,188, although forming a large percentage, in addition to the previous year's cost, has been expended on the three following classes exclusively, viz. :—

Persons permanently disabled from labour by reason of old age, infirmity, or bodily or mental defect.

Widows having two or more legitimate children dependent on them.

Persons disabled from labour by reason of severe sickness or serious accident.

Thus on the last Saturday of February the total number of persons receiving relief out of the workhouse under the 1st section has increased from 35,535 to 39,947, a difference of 4,412; including an increase of 1,428 in the class of "permanently disabled;" of 1,042 in the class of "widows with two or more legitimate children;" and of 19,42 in the class of "persons disabled by severe sickness or serious accident."

The total number of deaths in the workhouses in the year has been 12,789. In the corresponding table in the last Annual Report the total number of deaths was 11,190; so that there has been an increase of 1,599 deaths, as compared with the number last year.

Deaths by fever were 645, as against 617; by lung disease 2,274, as against 1,850; and deaths by small-pox 254, as against 12 in last year.

IN-DOOR RELIEF.

An increase of 4,921 has taken place in the total number admitted in sickness during the year; an increase of 43,389 in the number admitted who were not sick; an increase of 1,170 in the number suffering from fever and other dangerous contagious diseases, and an increase of 49,271 in the total number relieved.

FINANCIAL STATISTICS.

Poor-relief expenditure for the year ended 29th September, 1878, £845,608; for 1877, £780,326—Increase, £65,282: Number relieved, 1878, 224,100; 1877, 267.031 —Increase, 57,069.

There has been an increase of £43,879 in "in-maintenance and clothing," an increase of £8,188 in "out-door relief," an increase of £24 in cost of "deaf, dumb, and blind," an increase of £2,826 in "salaries and rations of officers," and an increase of £10,365 in "all other expenses," making a total increase of £65,282. The increase in the total number relieved has been 57,069.

TREASURY SUBSIDIES.

The following is a statement of the Parliamentary Grant for Medical and Educational purposes, and for Salaries under the "Public Health (Ireland) Act, 1874," for the year ended 25th March, 1378 :—

	Amount allowed for the Year. £	s.	d.
Medical purposes	70,351	8	0
Educational purposes	9,172	8	11
Total for Medical and Educational purposes ...	79,523	16	11
For Salaries under Public Health Act...	13,550	16	3
Total	93,074	13	2

The total amount allowed under the Parliamentary Grant

Digitized by Google

for Medical and Educational purposes, for the year ended 25th March, 1878, namely, £79,523 16s. 11d., is £677 2s. 2d. more than the amount for the previous year.

The amount for Salaries under Public Health (Ireland) Act, namely, £13,550 16s. 3d., is £202 18s. 1d. more than for the previous year.

Expenditure for all Purposes for Twenty-One Years Past.—While the total expenditure of poor rates for all purposes, viz., relief, medical relief, burial grounds, registration of births, deaths, and marriages, sanitary measures, expenses under Superannuation Acts, payments under Cattle Diseases Acts, and under National School Teachers' Act, was, in 1877, £1,030,798, making a poundage of 1s. 6½d. on the valuation, in 1878 the expenditure for those purposes was £1,124,221, thus showing a net increase in the total expenditure of £93,423. The current sanitary expenditure for the year was £48,157, in comparison with £44,870 in the previous year.

Summary of Cases of Medical Relief.—In Ulster there has been an increase of 6,081 cases at the dispensaries, but a decrease of 630 of those attended at their own houses. In Munster there has been an increase of 5,197 cases at the dispensaries, and of 5,442 of those attended at their own houses. In Leinster there has been an increase of 8,042 cases at the dispensaries, and of 2,964 of those attended at their own houses. I nConnaught there has been a decrease of 1,447 cases at the dispensaries, but an increase of 617 of those attended in their own houses.

Vaccination.—In the following table are shown the number of cases of vaccination in each year from 1855 to 1878; the Compulsory Act having been passed in 1864:—

	Number of Cases of Vaccination.		Number of Cases of Vaccination.
1855	46,711	1867	125,741
1856	84,131	1868	131,426
1857	47,855	1869	125,672
1858	54,984	1870	140,220
1859	140,411	1871	179,889
1860	107,305	1872	282,484
1861	90,256	1873	138,873
1862	89,863	1874	139,587
1863	106,510	1875	137,340
1864	191,810	1876	114,487
1865	169,142	1877	117,679
1866	137,124	1878	133,045

The next table presents the record of the vaccinations performed at the dispensaries and vaccination stations since 1864, distinguishing the cases of children born since January, 1864, from those of persons born before that time, the former being liable to, the latter exempt from, compulsory vaccination.

Total for Ireland of Number of Cases of Vaccination Performed during the Years ended September 30th.

Years.	Cases of Children born since January 1st, 1864.	Other Cases.	Totals.
1865	67,160	71,982	169,142
1866	104,730	32,394	137,124
1867	107,473	18,268	125,741
1868	118,613	12,813	131,426
1869	117,912	7,760	125,672
1870	135,057	5,163	140,220
1871	139,053	40,836	179,889
1872	142,662	139,822	282,484
1873	119,319	19,554	138,873
1874	119,337	20,250	137,587
1875	119,675	17,665	137,340
1876	112,489	1,998	114,487
1877	115,190	2,489	117,679
1878	122,149	10,896	133,045

There is an increase in the total number of cases vaccinated and revaccinated in all Ireland of 15,366 cases.

Defaulters Under the Vaccination Act.—There were 140,469 births registered in the year 1876, 139,659 in the year 1877, and 134,370 in the year 1878. The number of children vaccinated yearly in those years, and coming under the provisions of the Compulsory Vaccination Act, are returned as 112,489, 115,190, and 122,015 respectively, showing a decrease in the number of births, but an increase in the number of children vaccinated, and, therefore, a more satisfactory compliance with the provisions of the Compulsory Vaccination Act. With respect to defaulters under the Compulsory Vaccination Act, a return has been prepared showing the numbers of defaulters returned in the whole of Ireland for the half-year, ended the 30th June, 1878. The total results arrived at are as follows:

No. of Defaulters returned	16,48
,, found vaccinated	11,230
,, not found at addresses, dead, or left district	2,341
,, found still unvaccinated	2,918
,, unfit	1,148

THE EFFECT OF THE PUBLIC HEALTH ACT UPON IRISH SANITATION.

Abstract of a few Registrars' Notes.

(Continued.)

CLOGHEEN—*Caher.*—A portion of the district (the country part) has been unhealthy during the quarter, scarlatina, of rather a malignant type having occurred in it; six deaths are recorded; otherwise the district is healthy.

CLOGHEEN—*Clogheen, W.*—There has been an epidemic of scarlatina in this district during the quarter. The source of contagion cannot be ascertained. The epidemic has been of a mild type, and the mortality light, considering the number attacked. Three deaths in dispensary and private practice during the quarter. In nearly all the houses attacked by the disease, there was overcrowding and bad ventilation. No improvement could be effected in that respect. The other sanitary arrangements were fair. The necessary sanitary precautions were given. There has been no fresh case of scarlatina to my knowledge in the district within these last six days.

DUNGARVON—*Ringville.*—The severity and inclemency of the spring, and the variable temperature of the summer months predisposing to affections of the respiratory organs, 16 of the 26 deaths registered occurred from diseases of this class. The sanitary state of the district otherwise is satisfactory. No prevalence of zymotic disease.

DUNGARVON—*Whitechurch.*—The Public Health Act has been almost a nullity here. Cesspools reported years ago remain in the same state, the sanitary authorities being powerless to compel the poor to be cleanly, who, from want of rere accommodation, must deposit night soil, filth, and all refuse matter in holes now filled with putrid water, and which recently contained manure, in front of their wretched cabins. The district abounds now with this class of nuisance, but I cannot see the remedy for its abatement until suitable dwellings with yard and aspit in rear be provided.

Fermoy.—The sanitary condition of the north side of the town (Barrack Hill) leading to the barracks (military) is in a bad state. The water supply of this portion of the town is very defective, and there is *practically* no drainage from blocks of houses of which the place is composed. Pigs are kept in all the back yards, which are scarcely ever cleansed or white-washed. Reports to urban sanitary authority entirely neglected.

TRALEE—*Tralee, No* 1 *W.*—Fever, which was on the decline, has been more prevalent during the past quarter. As usual the cause of the disease is traceable to bad houses, and the dirty habits of the inmates; it is very

Digitized by Google

hard for local sanitary officers to thoroughly improve the class of labourers' houses by any amount of reports. If they were aided by a district sanitary officer, who should visit each district, their combined efforts would be productive of more real good. There is a small place not far from this now famous for fever; for the past few years it has been proverbial for producing fever, which spreads over the county, and will continue to do so till the class of houses is improved.

ABSTRACT OF REPORT ON THE DISTRICT, CRIMINAL, AND PRIVATE LUNATIC ASYLUMS IN IRELAND.

In the last Parliamentary Report, that for 1877, which we had the honour to address to your Grace, a return was given of the number of lunatics under our immediate supervision, and of the places in which they were detained. They amounted on the 31st December, that year, to a total, between both sexes, of 12,380; 6,047 being males, and 6,332 females, thus distributed:—

	M.	F.	T.
In Public Asylums	4,393	3,790	8,183
In Dundrum Central... ...	133	34	167
In Lucan Government Asylum	4	18	22
In Private Asylums	249	387	636
In Poorhouses...	1,268	2,104	3,372
Total	6,047	6,333	12,380

At a correspnding date in 1878, the insane were located as follows:—

	M.	F.	T.
In District Asylums	4,550	3,857	8,407
In Central Asylum	140	37	177
In Lucan Government Asylum	4	18	22
In Private Asylums	257	385	642
In Poorhouses...	1,320	2,017	3,337
Total	6,271	6,314	12,585

There thus appears to be an increase of inmates in the above institutions amounting to 205, of which increase district asylums, in consequenc of additional accommodation, have most largely participated, while there has been a small decrease of 35 in poorhouses. The increase of residents in asylums is not altogether owing to the admission of primary or acute cases; other causes have tended to it.

The deaths as well as cures in the year 1878 have been proportionately somewhat less than in the preceding year, while relapses have exceeded those in 1877 by thirty re-admissions.

The actual cases of first attack of insanity in the periods just referred to are all but identical, there being only ten more in the latter year, or 1,934, as against 1,924 in the former.

On the score of relapses, males appear to have been in excess by fully 16 per cent. over females; a circumstance fairly referable to the fact that physical causes are not only more prevalent than moral, but especially so in regard to males.

The total admissions during the past year, namely, 2,366, comprise 1,278 male and 1,088 females, of whom 178 were over 60 years; while between the ages of 20 and 40, 1,264 patients, in like proportion as to sex, were also admitted.

Comparing the general statistics of lunacy in all its different forms, as before us for the past five years, a marked uniformity in relative proportions is perceptible, so we may fairly assume that the principle of averages holds good in mental affections as existing in the United Kingdom in general; certainly, so in the population of this country, which average may be set down at the rate of 3 insane to about 1,200 sane.

With regard to the authority for admission, an important consideration ought not, perhaps, to be omitted here. The more correct practice, as in England—that by order of a Board, has, in great measure, been superseded in Irish asylums—ninety out of a hundred cases being taken in as urgent by resident physicians, or through magisterial committals. Two drawbacks are attendant upon this system—the first, an uncertainty as to the proper chargeability of patients—the second, a want of information as their previons history and symptoms—much being left to guess-work in the early stages of treatment. Still there is a benefit derivable therefrom, as lunatics are thus prevented from injuring themselves or others.

The actual recoveries, 1,047 — 532 males and 515 females—constitute a fair ratio, as to sex, on the aggregate number under treatment during the year. While in regard to the *improved*, who were taken home by their friends, reaching a total of 221—124 men, 97 women—a nearly similar proportion obtains Looking to the percentage of cures on the total resident, as well as to annual admissions, one year with another during the present decade, there would seem but little variation in Irish District Asylums. They may be fairly set down as ranging from 44 to 47 on recent cases, and from 11 to 13 on the aggregate in them.

Of the recovered, 197 had passed their fiftieth year; eleven of them being reported as over seventy.

It may be here remarked with regard to the mortality in Irish asylums, that generally speaking, it is lower than in like institutions elsewhere by nearly 1 per cent. In 1878, the deaths, 817, upon the total number under treatment were 7¾ per cent., being somewhat less than in the preceding twelve months. Of these 2 were from suicide, the first by a male in the Belfast, the second by a female in the Londonderry Asylums. In each case a coroner's inquest was duly held; as exculpatory verdicts were returned, it is needless to advert further to them.

Fortunately homicidal propensities are not prevalent among the actual insane out of doors, still less when under treatment in asylums; for exciting causes there are in great measure suppressed.

It is wonderful, however, how means are stealthily prepared occasionally, and opportunities sought by the suicidally-disposed for attaining their object, to guard against which must by a never-ceasing cause of deep anxiety to the superintendents and staffs of lunatic asylums. Very nearly 7 per cent., or 572 patients, in confinement at the close of the year, were deemed suicidal.

Two fatal accidents, against which, however, no foresight could have guarded, occurred. An epileptic lunatic at Richmond, and other at Sligo, were found dead from suffocation in their cells by the night watch. The remaining 812 deaths were attributable to the usual causes of mortality, the most predominant being pulmonary affections, 320, as against 223 of a cerebral character, and 172 from debility and old age. Seven male patients escaped during the year: four of them were convalescent, three still uncured.

Adding to the 8,183 inmates at the close of 1877, the admtssions 2,336, during the succeeding year, 10,548 would constitute the total under treatment in 1878. Deducting from which, recoveries, removal by friends, deaths, and escapes as above given, there remained in district asylums at the opening of the present year 8,047 persons —4,550 men, 3,857 women.

A classification of the preceding aggregate would, as regards their mental condition, distinguish them as follows:—1,840 lunatics, probably curable; 5,795 probably incurable; besides 576 epileptics, and 196 idiots. Many of the two latter are occasionally violent and refractory. Thus the curable would scarcely number 28 per cent of the total under treatment. Analysing the condition of the incurables, many, unpromising though they may seem, through scientific treatment and suitable occupations ultimately recover. The great majority, however,

Digitized by Google

for the most part tranquil and reasonable on many subjects, are liable to sudden outbreaks of passion. As a rule the most useful, they are nevertheless uncertain, and if excited become dangerous. For months plausible and quiet, they are subject to insane paroxysms, which continue for indefinite periods, and then completely subside to recur, frequently, in an aggravated form. Perhaps of all the inmates of an asylum, none require a more constant and careful supervision, and all the appliances a well organised establishment can afford, both for their own and for the safety of others, as may be inferred from the fact that no less than 1,315 were admitted as dangerous in 1878, either by warrant of the Lord Lieutenant or by magisterial committals. Hence, a very serious responsibility is entailed on the medical officers of asylums in regard to their absolute discharge, however convalescent they may appear; or to their removal to other establishments when not recovered.

Some of those painful incidents which, from time to time, harrow public feelings, from the untoward destruction of human life, are the deeds of patients comprised in this class.

Doubtless no inconsiderable number of inmates, composed of aged and utterly demented lunatics, as well as of epileptics and idiots, might be located in secondary institutions easy of access, situated in the immediate vicinity of district asylums, and thereby to a considerable extent existing ones would be eased; but as to any economy, bearing in view the Treasury rate in aid, little would be gained by the ratepayers at large on the score of current maintenance.

It should be remembered that incurables from physical and incurables from mental affections are not altogether in the same category, though the identity of term tends to place both before the public in the same light—the lunatic, being irresponsible for his actions both morally and legally, must be judged of by his peculiarity of temperament, equally as it affects himself and society. Hence, when it is said, and truly said, that an asylum is crowded with patients not likely to recover, the question should be asked—are the individuals safer and better circumstanced both personally and socially than if they were located in a less guarded establishment?

The expenditure with which we have to deal is that for the year 1877, inasmuch as audit certificates, but not transmitted to us in due time for an earlier publication, are required in support of its exactitude in detail. It amounted to a total of £200,031 8s. 9d. on an average number of 8,116 patients, being £23 17s. 3d. per head; in 1876 it was £192,265 16s. 5d., or £24 13s. 8d. per head, there being in that year 7,952 as an average of inmates; consequently a diminution in the capitation charge has arisen in 1877 of 16s. 5d.

If from the above total in 1877 the treasury rate in aid be deducted, viz., £80,379 16s., with payments from contributing patients, £3,518 10s. 8d. the actual outlay in Irish asylums, as met directly by local rates, amounted to £116,133 2s. 1d. This current maintenance is definite, including every charge incidental to their support and supervision.

At the Summer assizes of last year, the Act of 38-9 Vic. came into operation. Previously, and since the passing of the 1st and 2nd George IV., cap. 23, quarterly advances were applied for through our office by the different District Asylum Boards to the Lord Lieutenant in Council for current maintenance, and on their order all required moneys were issued in their favour by the Treasury. These advances, which bore no interest, we repaid half-yearly by grand jury presentments. The present statute directs that Boards of Governors shall transmit to the Inspectors twice annually estimates of the amounts necessary for these different institutions, which, when examined and passed by them, and subsequently countersigned by the chief or under secretary, are to be forwarded to the various secretaries to grand juries to be duly presented for and fiated by the judges on circuit at the next assizes. The amount being a first charge on the public is immediately payable into bank to the credit of the boards. Than this arrangement nothing can be more simple or satisfactory in its operation.

Assuming, as we apprehend that the calculation is very approximate—certainly not in excess—that provision for 9,600 inmates will be necessary to meet all the requirements of the insane poor of Ireland, and regarding the question simply in a fiscal point of view, their annual maintenance may, we think, be fairly set down for the future at £23 10s. per head, constituting a total of £225,600, subtracting from which the capitation rate in aid—£10 8s. a year, in the aggregate £99,840, as well as probably £5,760 from contributory patients, the net lunatic cost to the country would be £120,000, which, levied on its rateable property, £13,600,000, might be set down at 2d. and the tenth of a penny in the pound sterling.

Instead, however, of being accommodated in district asylums, if these lunatics were located in poorhouses, from the character of their malady they should be treated as hospital patients, and have besides a special staff of attendants for their own safety, and the protection not only of others, but of property. The average cost of an ordinary patient in a workhouse infirmary, if the varied items of expenditure as obtains in the debit of asylum outlay be minutely totted up, including all establishment charges, physicians, clergymen, matrons, masters, clerks, and other officials, cannot be under 5s. a week; so that, bearing in view the rate in aid, there is really a gain to the Irish public, *quoad* direct taxation of the difference £120,000 and £124,800, according to the existing system. Hence it would appear that not only is a more suitable treatment established for a section of society bearing to the general community a definite ratio, as the statistics of insanity demonstrate, but one more economical to the public in behalf of a class deprived of liberties and social privileges, from a visitation of Providence in the vast majority of instances, for doubtless few, but very few, comparatively speaking, are in part responsible for their own misfortune.

In 1874 the expenditure of this country on the current maintenance of its lunatic poor, averaging daily 7,497 asylum inmates, amounted to £190,511 15s. According to the preceding calculation 9,600 persons under a like treatment would be annually supported at about £120,000, or £70,000 less, for fully two thousand more patients. Hence theories that could be advanced five years ago, cannot owing to the late Treasury grant be now well sustained.

In previous reports we had the satisfaction of adverting in favourable terms to the mode in which the accounts of institutions under our immediate supervision had been testified to by the Government auditors. On the present occasion the same agreeable opportunity is afforded us; for on analysing all the returns submitted to this office under the Act 31 and 32 Vic., cap. 97, no irregularity tending to the loss of a shilling has occurred, with the exception of deficiencies in the storekeeper's department at Londonderry. At the same time, it is but right to state, the books of the clerk there were kept in a satisfactory manner, all cash received by him was duly accounted for, and the outlay fully authorised.

(To be continued.)

TO READERS.

THE Editor will feel especially obliged by receiving copies of newspapers which contain any Poor-law or other intelligence of medical interest, in order that he may, if fit, republish it for the benefit of the readers of the *Medical Press*. Although twenty-one of the leading Irish newspapers are received at the Irish office, many things may escape notice which are deserving of attention. Newspapers should be marked, and addressed to Dr. JACOB, at the Dublin offices of this paper.

CASE OF OVARIOTOMY.

By LOMBE ATTHILL, M.D.,
Master of the Rotunda Hospital, Dublin.

Ovariotomy is so frequently performed now-a-days that few care to read the details of an isolated case. The following one, however, was to me of special interest; I therefore give it at some length :—

Mrs. ——, a widow, æt. 52, and a large heavy woman, came under my care in March last. She stated that she had never been pregnant, and that till two years ago had always enjoyed good health. At about that time menstruation began to be irregular; she suffered from dyspepsia and loss of appetite, and became weak and debilitated. Shortly after, she perceived that her abdomen was enlarged, but did not suspect the existence of any serious disease; and when at last she did seek medical aid, was treated for "dropsy," without benefit.

When I saw her she was an enormous size, and measured 52 inches round the abdomen. Fluctuation was very distinct, and the anterior surface of the abdomen was dull on percussion—the flanks being resonant, while the uterus was normal in size and shape, and the existence of a large ovarian cyst, probably unilocular, and nearly free from solid matter, was diagnosed.

The patient was at this time in a very debilitated condition. She suffered constant pain, and moved with the greatest difficulty. The tongue was dry and fissured, and the urine, which was very scanty, was loaded with lithates. Evidently no time was to be lost if life was to be saved, and I recommended the immediate performance of ovariotomy. The patient at once consented, and on the 14th March I performed the operation, assisted by Dr. Kidd and Prof. Bennett. Æther administered by Dr. William Smyly was the anæsthetic employed, and thymol spray was used as an antiseptic.

The operation did not present any special difficulties, but the abdominal parietes were loaded with fat, while the wall of the cyst was so very thin that, when only partially emptied, it gave way, the fluid escaping into the abdomen. This, however, was all thoroughly removed by sponging; the pedicle was secured with a hemp ligature, cauterised, and thrown back into the abdomen. There was no vomiting during the operation, nor subsequently, till long after all effects of the æther had passed off. The cyst proved to contain a small secondary one; there was not any solid matter.

At 4 p.m., five hours after the termination of the operation, the pulse was 96; temperature in the vagina, 101·2°. Ice given freely.

11 p.m.—Pulse and temperature unaltered; urine scanty and high coloured; no deposit in it. To have 1 ounce of beef-tea every two hours, and ice *ad libitum*.

15th., 9 a.m.—Temperature, 101·4° in vagina; pulse, 98. Complained of stinging pains in the abdomen. During the day vomited.

At 10 p.m. the temperature rose to 102·4° (in the vagina); pulse, 98, being very restless and suffering some pain half a grain of morphia was administered hypodermically.

16th.—Had a good night. Temperature, 101·5°; pulse, 100; much tympany; a red discharge, apparently menstrual, appeared, continuing for several days; had much pain in the abdomen when she coughed or moved; vomited several times during the day, this, on the last occasion was "coffee ground," the previous vomit not having been green; the urine was scanty and did not deposit any lithates; it was of a most peculiar red colour, leading to the supposition that it contained blood—a specimen of it drawn by a catheter was examined by my friend Dr. Harvey, but it did not contain any blood.

18th.—Great tympany, but still very little pain; vomits nearly everything swallowed, the ejecta frequently being "coffee ground;" the vomiting was always temporarily restrained by the hypodermic injection of morphia, half a grain being thus administered morning and

Digitized by Google

evening from this date for a considerable period. Everything swallowed being rejected, whether brandy, beef-tea, lime-water, and milk, or essence of chicken, I now ceased to administer food by the mouth, but directed that 2 ounces of beef-tea and half an ounce of brandy should be administered, per rectum, every two hours, and this method of giving nourishment was continued for the following twelve days, ice alone being allowed by the mouth, and the temperature having risen during the day to 102° (pulse, 108), I commenced the use of the ice-cap; this gave the patient much comfort, and the temperature gradually fell to 100·6°.

20th.—Condition very unsatisfactory; abdomen enormously distended; constant "coffee ground" vomiting; great restlessness, only quieted for a time by the hypodermic injection of morphia; forbidden to take anything by mouth, even ice.

21st., 9 a.m.—As the result of the absolute prohibition to swallow anything, she has not vomited since 10 p.m. last night. Allowed a little tea. Pulse, 108; temperature, 100·8°.

10 p.m.—Vomited only once, but pulse and temperature have both gone up; two-thirds of a grain of morphia hypodermically.

22nd., 9 a.m.—Pulse, 108; temperature, 101·4°; coffee ground vomiting has returned; to have a sheet wrung out of cold water constantly over abdomen, this to be changed every few minutes.

10 p.m.—Temperature has fallen since application of cold sheet to 100°; has not vomited since 11 a.m., but has brought up 4 ounces of green fluid just now.

23rd.—Had a quiet night; wet sheet constantly changed; temperature, 99·8°; pulse, 96. The wet sheet is very comfortable to patient, and has, in twenty-four hours, reduced the temperature 1·4°. It was now discontinued a few hours, but was recommenced at 10 p.m.; during the day were vomited "coffee grounds;" deposit of lithates in urine.

24th.—Temperature, 99·6°; pulse, intermittent; tympany, if possible, greater. Allowed a little champagne, but vomiting returned immediately, and she flushed up greatly.

25th.—Temperature, 98·8°; abdomen, a little softer; vomited coffee grounds once. To have a little thin gruel, this being the first time anything has been given by the mouth since the 19th, except champagne once. The bowels not having been moved since the operation, an enema of castor-oil and turpentine was administered with the long tube; it was retained, but did not produce any effect. The application of the wet sheet, which had been suspended for a few hours in the morning, was resumed at night, the temperature having risen to 100°. Some flatus passed.

26th.—Temperature, 99·2°; pulse, 90; no "coffee ground" vomiting, but the gruel is brought up nearly unchanged.

27th.—Temperature, 100·2°; tympany increased; wet sheet still continued almost constantly, being always applied when the temperature rises to 100°.

28th.—A fortnight to-day since the operation; condition very critical; there is enormous tympany, and though the vomiting of "coffee grounds" has ceased, everything taken seems to be rejected; is fed altogether by the beef-tea and brandy enemata, to which the yolk of an egg has of late been added twice a day; bowels remain obstinately constipated; temperature rises if the wet sheet be withdrawn; back beginning to become sore; is very restless, except for a few hours after the hypodermic injection of morphia, which is administered morning and evening. Saw Dr. James Little in consultation, he recommended the administration of salicylate of sodæ in effervescence.

30th.—Temperature, 99·8°; pulse, 104; has not vomited since 3 p.m. yesterday; has taken a little gruel, this being the first food retained since the 18th; abdomen softer; passed some flatus.

31st.—A bed-sore forming over sacrum, and also over left trochanter; was placed on a water-bed; gruel was administered nearly every hour, and generally retained.

April 4th.—Had a feculent evacuation from bowels, this being the first evacuation since the operation was performed, exactly three weeks ago.

6th.—Hypodermic injection of morphia discontinued; egg, beef-tea, and various thin forms of farinaceous food taken with relish.

From this date convalescence proceeded slowly but steadily; the bed-sore proved very troublesome, and healed very slowly; the wound in the abdomen also suppurated, and did not close for several weeks, but her recovery was ultimately perfect.

The treatment adopted throughout the whole of this patient's protracted illness was expectant. No attempt was made by the administration of purgatives to get the bowels to act; I believe that such an attempt would have failed, and would only have tended to increase the existing distress. Purgative enematas were on two or three occasions administered with the long tube; they did not produce any effect, save that of causing some discomfort to the patient, and the attempts to free the bowels by them was therefore discontinued. Opium, administered twice daily in the form of the solution of morphia hypodermically, was for a long time the sole medical agent employed; it always quieted the distressing peristaltic action of the bowels, produced sleep, and for a long time checked the vomiting. I believe the patient's recovery was mainly due to this persistent administration of morphia.

The application of cold to the surface of the abdomen was also of the greatest use; it was continued with but little intermission for nearly ten days. The patient lay on an india-rubber sheet, with the night dress drawn up as high as the axilla, another piece of water-proof sheeting was tucked under it and turned back outside it, so as to protect the night-dress from damp and keep the thorax warm. In like manner the bedclothes covering the legs were protected from damp by a piece of india-rubber sheeting; thus, the chest, arms, legs, and feet were kept warm, the abdomen alone being exposed, a large bath-towel wrung out of cold water was then laid over it; this was changed very frequently—at first, every five minutes, then, whenever it felt warm to the hand, after the administration of the morphia at night, a bag made of thin gutta-percha tissue filled with ice was substituted for the towel for an hour or two; this was done to prevent the patient being disturbed during the sleep which the morphia always produced. If the patient complained of being cold, the cold applications were discontinued, to be resumed the moment the temperature rose to 100° in the vagina; this generally occurred within an hour and a-half of the withdrawal of the cold. By this means the temperature was permanently prevented from rising, whilst the patient experienced but little discomfort from the treatment.

The coffee ground vomiting was of course a very alarming symptom; as a rule, I am in the habit of looking on it as a fatal one, and this is the first case of ovariotomy in my practice in which recovery followed after its occurrence.

The patient was fed for fourteen days, altogether by the rectum, one and a half-an-ounce of beef-tea and half-an-ounce of brandy being injected every second hour; it was nearly always retained. After a time the yolk of an egg was added twice in the day, and for a couple of days milk was substituted for the beef-tea, but it did not answer so well, a large quantity of it being expelled after the lapse of some hours in a very fœtid state, while this never occurred with the beef-tea.

The only encouraging feature in the case was the recurrence of the menstruation. This is always a good symptom.

To what the obstinate constipation and consequent tympany were due, is not absolutely clear; probably, to a localised enteritis, though there certainly was also some peritonitis present.

ON INTERMITTENT BRONCHO-PNEUMONIA.

By H. CRIPPS-LAWRENCE, L.R.C.P., Lond., &c.

The cases about to be considered as illustrations of this affection are but few in number, and they will be recorded in reference to observations and inductions made respecting them.

A. Let me first proceed with the observations.

Case 1 was published in the *Medical Press and Circular*, of October 16, 1878, under the following title: "A Case of Metastatic Lobular Hyperæmia of the Lungs, and Dry (left) Pleurisy, as Sequelæ of Measles." I mention this title here because it epitomises, so to speak, the clinical features of this form of lung congestion.

Case 1.—Read from published report.

Case 2.—J. M., æt. 2 years 5 months. Health fairly good from birth. Five months previous to my first visit she was left at home with her nurse, her parents being away. The child continued well apparently for four months of this period, but one month before I saw her she was reported to have become languid and feverish, and one week later, that is three weeks before my attendance commenced, she had become evidently ill, the prominent symptoms being cough and feverishness.

On November 5th, 1878, I saw the child for the first time, and on examination of her chest I found the physical signs normal with the following exception:—Dulness was present on percussion over the apex of the left lung, posteriorly extending from the supra-spinous fossa as far downwards as the junction of the lower and middle third of the left scapula. This dulness was chiefly marked above, gradually diminishing from above downwards. Respiratory murmur was absent, and the vocal resonance increased superiorly; the symptoms being relatively altered in character from above downwards, until at the level above mentioned, normal lung was demonstrable by the absence of abnormal physical signs. An ordinary saline mixture was prescribed. It is noteworthy here that the child had vomited.

8th.—Temperature 98·4, respiration 24, pulse 88. The dulness and hyperæmia of the posterior apex of the left lung had nearly disappeared. The patient now complained of inability to stretch her legs and thighs out without pain, more especially the right one.

9th.—Temperature 102·8, respiration 44, pulse 140. Respiration markedly thoracic. A patch of dulness detected over the right scapular region, with coarse breathing, but neither bronchophony nor crepitation were audible. Cough frequent, spasmodic, and suggestive of pertussis. Vomiting had occurred twice, and the bowels had acted once. Tenderness felt over the cæcum, accounting for the thoracic respiration. Repeat mixture. Balneum vespere, 92 deg. Fahr; catap. lini capiat i coli.

10th.—Temperature 99·4, respiration 24, pulse 96. Hyperæmic patch over the right scapula gone. Much relieved by the warm bath. Patient had slept from bed time till 2 a.m. Cough looser, less frequent; no vomiting; bowels had acted. Motions reported natural. Slight tenderness over the cæcum. Repeat mixture.

11th.—Temperature 100·2, respiration 32, pulse 120. A limited patch of dulness about the size of a florin was now detected near the angle of the left scapula, and bronchial crepitation was audible over it. Tenderness diminished, but pain was felt over the cæcum, and the legs were still drawn up. Upon further inquiry it was elicited that for the last four days a marked periodicity was evident in the febrile condition and this was intermittent in type. The attack, it was observed, commenced with either a modified rigor or with sickness, and from 4.30 p.m. to 9 p.m. the child was hot and feverish; after 9 p.m. the hot stage gradually passed off, leaving the patient sweating until 4 p.m., when she became cool again, until the return of the attack in the afternoon. Quinine was now ordered in gr. ¾ doses thrice daily, with a double dose an hour before the expected return of the attack.

This afternoon (November 11) the attack was modified, no fever occurred at 4.30 p.m., but at 7 a.m., November 12th, there was a rigor, with an inclination to, but no actual occurrence of, sickness. Little or no appreciable fever followed, but from 10.30 a.m. till 4.20 p.m. more or less sudoresis was observed, after which the patient continued cool. Temp. 99.2, resp. 24, pulse 92. No abnormal chest sounds. No tenderness over the cæcum. Bowels had acted; debility was more marked. The dose of quinine was doubled throughout, and ʒj. sp. vini gallici given in milk every three or four hours.

18th.—The nurse reported that on November 16, four days after doubling the dose of quinine and ordering the brandy, the fever had commenced at 12.30 noon, a variation in time which is noteworthy. Moreover, the febrile attack was fugitive and slight in character; at 8 p.m. vomiting occurred without subsequent fever. No fever after November 16th. Ordered a dose of syrup, sennæ et rhei. Temp. 98, resp. 20, pulse 88.

21st.—No fever; no vomiting; slight cough, but no abnormal chest sounds. Bowels acted freely after the laxative. To continue double doses of quinine.

28th.—Convalescent. Gaining appetite, flesh, and strength. Repeat mistura, quinine ter die vel ut opus sit.

On February 15, 1879, I saw this patient, and learned that convalescence had progressed uninterruptedly from the preceding November, and she had remained well since.

Case 3.—I was unable to observe in a satisfactory manner owing to the slight degree of the illness. Yet, as the main features presented by the case were allied in character, though in a diminished degree as compared with the others, I have ventured to include it as illustrative of this form of lung hyperæmia.—T. B. æt. 6 years, enjoyed good health up to April, 1878, from which date we may follow up the history of the case.

In April, 1878, the patient went with his mother to Winchester in excellent health. In May he complained of sore throat, coughed a good deal, and lost his appetite. At this time he was seen by a medical man, who was at this time attending the boy's aunt, for a sore throat which was attributed to imperfect drainage. Upon hearing this his mother removed the patient from Winchester into Somersetshire. Here he improved in health, and a fortnight later he went to Tiverton in Devonshire. Here both the patient and his sister complained of, and were ill with, sore throats, for which reason they were removed to Westward-Ho, where they both soon regained health and strength.

In October, 1878, the patient went to stay with some friends at Newton-Abbott, where he relapsed into ill-health, commencing with a cold. He now returned to Tiverton, and soon after began to cough. Had fever at night, with some chilliness or shivering in the day-time. The house at Tiverton is reported to stand on high ground with a good deal of water stagnant in the lowland around it, while a canal runs below the long garden at the back of the house. In October the ground was dug up to make a new drain, and at this time the first well-marked rigor occurred.

At my first visit, on January 2, 1879, I found the boy weak, with flabby muscles, a sallow, almost earthy, complexion from pallor, while cough, with shivering once or twice in the twenty-four hours, followed by fever and sweating, were the prominent symptoms.

The periodicity of the rigors, the loss of flesh and appetite, the increasing debility, and increasing cough were all points which had been noticed by the patient and his mother also.

Upon physical examination of the chest, all appeared normal, except in the upper part of the right inter-scapular region, where a patch of dulness, about the size of a five-shilling piece, was noted; over this area vocal resonance was relatively increased, and respiration was audible. This patch was painted occasionally with the linimentum iodi. The physical signs varied, gradually lessening in degree, until they almost disappeared on January 9th.

Digitized by Google

On January 13th, however, they re-appeared, being almost gone again on the 17th.

On January 17th, however, there was noted a slight increase of dulness towards the sternal end of the right infra-clavicular region.

I now lost sight of the patient for a few days, during which interval he moved from an unhealthy house to a more airy and healthier one.

At my next visit, on January 27th, the abnormal chest sounds had almost disappeared, and on the 30th, the chest was quite normal.

This patient was treated throughout with gr. j. doses of quinine every four hours. When I first saw him the rigors were noticed to occur periodically at 6 a.m. and 6 p.m., daily, were well marked in character, and followed by evident fever and subsequent sweating.

Irregularity in the periodicity of attack was the first sign of improvement, which was soon followed by less marked rigors, less fever, and less sweating, until at the end of the month the attacks were quotidian in type, and of very slight intensity. The periodicity, however, was evident after the lung hyperæmia disappeared the first time.

Before dismissing the observations, let me add a word respecting the treatment and prognosis of these cases.

The first and most typical of these cases puzzled me not a little, until the periodicity appeared as a prominent symptom in the attack, and gave me the key and clue to the necessary treatment—the administration of quinine.

Until this periodicity became marked, I prescribed salines with unsatisfactory result, but so soon as quinine was given, amelioration, followed by cure, occurred in this, as in all the cases recorded. The treatment adopted in Case 1 illustrates that necessary for this condition of lung universally, and will be found in the *Medical Press and Circular*, of October, 1878, p. 311.

In reference to prognosis, an irregular course of lung congestion should lead us to suspect the presence of some abnormal systemic influence, and if it be associated with an intermittent type of fever, the presence of a miasmatic origin becomes probable. As a consequence, the prognosis should be guarded, and this especially in respect to two points—

1. The period of the attack may be, most probably will, be lengthened, as compared with ordinary lobar or lobular pneumonia.

2. As to the events of the attack, the poison may gradually expend itself; but the more virulent it is in character, *i.e.*, the more marked the miasmatic influence, by so much does the probability increase that the poison will express itself by a localisation, either in an endo- or pericarditis, an empyæmia, a peritonitis, or in one or more local abscesses.

In Case 1 the elimination was markedly by the skin, and the cutaneous hyperæmia indicated the employment of daily friction of the skin with maintenance of warmth of surface.

B. The inductions suggested by these cases appear to me the following :—

(*a*) These cases illustrate an interesting clinical variety of lung congestion. This hyperæmia of lung differs from ordinary lobular or lobar pneumonia. In the first case, no distinct pathognomonic lung congestion occurred, running a definite course to subsidence in resolution, or disintegration of lung tissue. On the contrary, there were found physical signs of hyperæmia, occurring here, or there, or anywhere, not spreading by continuity, but attacking various parts of the lung and different organs, *per saltum*. For in the first case, there was co-incident dry pleurisy; while in the second, marked tenderness of the cæcum co-existed with the lung complication.

Be it remembered, however, that in the first case, on May 2, 1878, the base of the right lung threatened consolidation; and the physical signs of consolidation were stationary and indolent in the third case. These facts are noteworthy in reference to the nomenclature of the disease.

(*b*) The occurrence of a rapid metastasis in lung hyperæmia, complicated or not with co-existent congestion of other viscera, is suggestive of an altered blood state finding its expression in an abnormal systemic condition.

(*c*) The occurrence in each case of a more or less well-defined rigor, followed by fever and sweating, pointed to a malarial poison as the *fons et origo mali*. And here note that in Case 1, a swampy district in the neighbourhood of the school to which the first patient went, afforded a hunting ground for the boy naturalists, not unmixed with danger to those predisposed to the influence of marsh miasm by ill-health or debility.

In Case 2, the father of the child informed me that for upwards of a year previous to her illness, the ground skirting the small garden at the back of his house, had been excavated and exposed to the air, previous to being used for building purposes. This is a very interesting fact, as it brings home to us, very practically, knowledge of which we have abundant testimony from malarial districts proper. In Japan and China it has been a common experience that troops quartered near to *ground recently exposed to air*, had intermittent fever rife amongst them.

In England we are too apt to regard intermittent fever as a disease peculiar to certain countries or limited districts. This may be true of the typical and genuine form of the malady, but until a more exact state of science shall enable us to separate the *fons et origo mali* of intermittent fever, we shall be wise not to disregard the plain teaching of facts. The rapid growth of large towns and cities necessitates the exposure to atmospheric influence of earth which, though not essentially marshy, is nevertheless untilled, and the emanations thence resulting may be productive of more or less intermittent fever in human beings living in such neighbourhoods.

(*d*) In each case a period of incubation, predisposing to malarial influence, was well-marked :—In Case 1 the patient had first varicella, then measles in February; in the interval between February and April he was at school, and, presumably, though the actual proof is wanting, may have been occasionally bird-hunting in the adjacent swamp. On April 8th he became ill, and on April 12th had inflammation of the lungs and (right) pleurisy, which, later on, relapsed into typical intermittent broncho-pneumonia.

In Case 2, a child of almost infant years, is unwittingly living near unhealthy emanations, arising from ground excavated for building purposes (subsequent investigations demonstrated imperfect drainage and imperfect sanitary arrangements also). The primary effect of the malaria rendered such a system prone to be prejudicially affected by continued exposure to its influence. In due course, such exposure continuing in operation, the specific influence of a baneful miasm expressed itself in a mild and modified but specific attack.

In Case 3 the history pointed also to prominent predisposing ill-health. This had been induced by bad drainage: then came the debilitating catarrh at Newton-Abbot; followed soon after by living in an unhealthy house at Tiverton; for though, on high ground, it was surrounded by damp, marshy, low-land; and, lastly, but by no means least an exposure to recently excavated earth—for at this juncture, when the earth was excavated to make the new drain, we learn that the first well-marked rigor occurred.

(*e*) The metastatic character of this form of hyperæmia of the lung, with or without co-existent implication of the other viscera, should lead us to suspect an altered blood state; to search for a history of intermittent; and if this be found, at once to adopt its specific treatment by quinine.

(*f*) Quinine is a specific for intermittent broncho-pneumonia.

(*g*) The term intermittent broncho-pneumonia appears preferable to intermittent pneumonia. Ordinary broncho-pneumonia only intermits in a very limited sense. It intermits somewhat in its access and regress; but the term intermittent broncho-pneumonia implies a much more definite fact than this, viz., its association with, nay its

Digitized by Google

dependence for existence, upon the presence and action of a miasm, capable of inducing a truly intermittent form of disease. It is allied to ordinary broncho-pneumonia, in that one or more lobules become hyperæmic at a time; in some cases the lung hyperæmia becomes a consolidation, and thus the disease associates itself, though very locally, with pneumonia, to which statement the transitory consolidation in Case 1, and the more permanent one in Case 3, bear witness. Thus compound in nature, intermittent broncho-pneumonia suggests many interesting thoughts respecting the etiology of broncho-pneumonia, and of pneumonia proper. The disease itself appears to be a nondescript hybrid, anomalous in nature, as well as in type.

These observations and inductions may possess an increased interest from the fact that they result from my independent clinical observation and induction, and it was not until I had arrived at these conclusions that I became aware that the disorder had been previously described. This statement, while on the other hand it exhibits a personal ignorance on my part, which for some reasons I would be glad not to have to plead, is, on the other hand, eminently satisfactory to me, as I can appeal to the recorded independent observations of others to substantiate the statements I have already advanced.

In the 1871 edition of Reynold's "System of Medicine," there is a brief notice at p. 615 by Dr. Wilson Fox on the effect of irritating vapours in the production of a disseminated form of pneumonia resembling closely the lobular pneumonia occurring in bronchitis; and at p. 616 of the same work the subject of intermittent pneumonia is briefly discussed.

The French term of intermittent broncho-pneumonia appears to me preferable, as expressing more accurately the physiological and pathological conditions associated with the affection we are considering.

Turning to French medical literature, I found in the *London Medical Record*, of Feb. 15, 1876, a note that on Jan. 11, 1876, M. Bourgada, of Clermont, read a memoir on Intermittent Broncho-Pneumonia before the Academy of Medicine in Paris. This affection, it is stated, M. Bourgada had frequently observed in the middle regions of France. It constitutes an incipient paludal affection, a remittent fever with bronchial and pulmonary localisations. It is more mobile than pneumonia; irregular in its progress, assuming the tertian or quartan type. It is amenable to quinine, which affects a cure without local treatment.

In the *L'Union Médicale*, of August 19, 1876, in a clinical lecture on "Intermittent Fever in Children," delivered by Dr. J. Dubrisay, before the Medical Society of Paris, in June, 1876, an exceedingly confirmatory illustration of intermittent broncho-pneumonia may be read, from which I translate the following paragraph as apposite and interesting:—

"The subject of intermittent fever, and especially as it occurs in childhood, has been singularly ignored by most authors. The pathological works extant among us, are for the most part silent on the theme. Treatises especially devoted to intermittent fever and the diseases of children such as those by Barrier, Billard, Rilliet and Barthez, Vogel, Trousseau, West are not explicit enough respecting it."

In the work by Bouchut, the first edition of 1845, there was a long chapter on the subject, and after this several practitioners published memoirs and observations thereon, in the journals.

Among others I may mention Sémanas in 1847, in the *Gazette Médicale*; Guiet in 1850, in the same journal; Ebrard, Valleix, in 1848; Schnitzer in 1849; Alaboisette in 1850; Aubinais in 1851; these five all contributed to *L Union Medicale*.

In the collection of the *Archives* and in that of the *Gazette Hebdomadaire* I have not been able to find any important document about it. Lastly, in the *Revue des Sciences Medicales d'Hayem*, of the year 1873, vol. ii., chapter i., I have met with a detailed analysis of a lengthy memoir published by Professor Böhn.

When a subject is thus passed over it behoves each one to record any new facts he may meet with; to compare them with previous observations; and then, instead of such a topic remaining buried in obscurity, it will soon be investigated and become a recognised item of professional knowledge.

THE MEDICAL HISTORY OF THE TEMPERANCE MOVEMENT.

By NORMAN KERR, M.D., F.L.S. (*a*)

At no stage in the onward progress of the temperance movement have representatives of the medical profession ever been wanting. In the early or moderation stage, when the advocacy of temperance reformers was confined to abstinence from ardent spirits, a numerous company of Æsculapians was invariably in the van.

Leaving out of the reckoning altogether the many unstinted commendations of temperance by the early fathers of the healing art, while united temperance effort was yet in the womb of time, from the ranks of the noble profession of medicine emanated graphic expositions of the physical, mental, and moral dangers accompanying even limited alcoholic indulgence.

In 1725 Dr. Cheyne had issued a second edition of his first work (1), in which he commends total abstinence as the most natural, healthy, and safe mode of living, and condemns moderate drinking as unhealthy and dangerous.

In 1747 Dr. James (2) wrote, "Every person who drinks a dram seems to me guilty of a greater indiscretion than if he had set fire to a house; and for the same reasons cordial waters are the most dangerous furniture for a closet." Again, "I cannot forbear admiring the great wisdom of Mahomet, who has strictly forbade his followers the use of fermented liquors for better reasons than are generally apprehended."

Dr. Darwin, author of "The Botanic Garden," in 1794 (3) calls wine "a pernicious luxury in common use, and injuring thousands."

In 1802 Beddoes (4) pointed out the many dangers attendant on the social and medical use of intoxicating drinks, dwelling on the "mischief from wine taken constantly in moderate quantity," and emphasising "the enfeebling power of small portions of wine, regularly drunk."

Dr. Trotter, two years later (5), denounces beer as a "poisonous morning beverage," says "wines strengthen neither body and mind;" and thus writes, "When wine was first introduced into Great Britain, in the thirteenth century, it was confined to the shop of the apothecary. It would have been well had it always been confined there."

Writing to Dr. Joshua Harvey in 1829, Dr. John Cheyne, Physician-General to the Forces in Ireland, in a letter published in Dublin (6), contends that the medical profession "ought to make every retribution in their power for having so long upheld one of the most fatal delusions which ever took possession of the human mind." Dr. Cheyne also trenchantly exposed the fallacy of supposing that fermented wines recruited the strength in bodily or mental exhaustion.

So much for British medical men in the prehistoric temperance era. If we turn to America, we find Dr. Rush, nine years earlier than Beddoes, vigorously engaged in enlightening his fellow-countrymen on the terrible evils wrought by the imbibition of ardent spirits (7). In 1813 Dr. Reuben Mussey, of Salem, was doing good service, and four years later Dr. Torrey was hard at work, as was Dr. B. J. Clarke in 1822; Dr. John Ware, of Boston, in 1823; Dr. Gamaliel Bradford, in 1826; Dr.

(*a*) Read at the Temperance Jubilee Fete, Crystal Palace, September 2nd, 1879.

Charles A. Lee, of New York, in 1827; and Dr. Flint in 1828 (8).

The period of incubation having ended, we find numerous representatives of the medical profession officiating at the hatching of the promising Bird of Temperance, and carefully watching over its infant life of abstinence from distilled spirits alone. Among the office-bearers of the Glasgow and West of Scotland Temperance Society, in November, 1829, was Dr. Charles Ritchie (9), and in the same year Dr. Kirk (10) occupied a similar position in Greenock. Among the officers of the Hibernian Temperance Society, in 1831, were Drs. Harvey, Cheyne, Pope, Adams, and Bevan (11). In June, 1831, at the head of the British and Foreign Temperance Society were Sir John Webb, M.D., Sir Jas. McGrigor, M.D., Sir Matthew Tierney, M.D., Sir John Richardson, M.D., Dr. Conquest, and Dr. Pidduck (12).

When temperance had emerged from its infancy of total abstinence from ardent spirits and moderation in the use of wines and malt liquours into the full bloom of teetotal manhood, the representatives of medicine were still conspicuous by their presence.

A veteran Æsculapian to this day in professional harness, my honoured friend Dr. Daniel Richmond, of Paisley, had the privilege of being one of the founders of the Youths' Temperance Society there on 14th January, 1832 (13), and on the succeeding day of assisting at the formation of another total abstinence society in the city of Glasgow (14).

In England Dr. Grindrod; Mr. Higginbottom, of Norwich; Dr. Beaumont, of Bradford; and Dr. Oxley, of London, were among the pioneers. To no member of the profession is the temperance movement more indebted than to the venerable though vigorous author of "Bacchus." He was one of the first, if not the first, medical man to sign the pledge (15) a practical abstainer for years before, and an avowed one in 1830 (16). He founded the first exclusively teetotal society in England, at Manchester, on 25th February, 1854 (17). In 1835 he established a children's society, a veritable Band of Hope, in the same city (18). In that year, and for many years thereafter, he was journeying through the length and breadth of the land delivering illustrated lectures (many of these presided over by medical men) on the physiology of alcohol, teaching that alcoholic beverages were "pernicious, poisonous, deadly" (19). More than 100,000 persons took the pledge at Dr. Grindrod's lectures (20). Eight doctors signed after his lecture at South Shields (21). He advocated the institition of coffee taverns as conteractives to drunkenness in 1835 (22). He was the first in this country to utter sound views on what is known as "the unfermented wine question," taking in answer to objections urged against total abstinence from the supposed Scriptural sanction of the ordinary use of intoxicating liquors, the stand all enlightened students of God's Word must eventually occupy, that the wines mentioned in the Bible embrace both fermented and unfermented varieties (23). Dr. Grindrod was advocating these views as early as early as 1834 (24) He took the leading part in establishing the first abstinence organisation, the British Temperance League, in 1835 (25); and, having organised temperance societies in connection with St. Paul's Church, Manchester, in 1835, may be said to have been the real founder of the great Church of England Temperance Movement. From the first he advocated that every church should have a temperance society, and every Sunday school its Band of Hope (26). Dr. Grindrod was the first to propose the compulsory detention of habitual drunkards (27).

Dr. Beaumont was an abstainer in 1829, and published an exposure of the dangerous effects of strong waters in 1830 (28).

Mr. Higginbottom, F.R.S., was probably an abstainer many years before the birth of the movement, and had abandoned the prescription of alcohol as early as 1832 (29).

Dr. Oxley was a teetotaler in 1790 (30), and also among the first was Dr. Kirk, of Greenock. Dr. J. C. Ferrier became a declared abstainer in 1832, Dr. Menzies in 1835, and Dr. Burn in 1836, all in Edinburgh; Dr. Menzies being the second, and Dr. Burn the third president of the Edinburgh Total Abstinence Society. Mr. Bennett, of Winterten, joined the ranks in 1835, Mr. Mudge, Mayor of Bodmin, and Mr. Julius Jeffreys, F.R.S., in 1837. Among those who rapidly followed suit were Dr. Lovell, of London; Dr. Collenette, of Guernsey; Dr. Fothergill, of Darlington; Dr. Gordon, of Hull; Mr. Courtenay, of Ramsgate; Mr. Nicolls, of Longford; Dr. Robert Martin, of Manchester; Sir John Forbes; Dr. Thompson, J.P., of Bideford; Mr. Batchelor, of Dunstable; Dr. Mackenzie, J.P., of Inverness; Mr. Townson, of Liverpool; Dr. Holdsworth, of Wakefield; Dr. McCulloch, of Dumfries (whose lecture to the Scottish Universities in 1852 did yeoman's service); Dr. David Brodie, of Edinburgh; Dr. Linton, of Aberdeen; Dr. Adams and Dr. Thomson, of Glasgow; Dr. Jeffrey, of Ayton; Dr. J. C. Reid, of Newbiggin-on-Sea; Dr. Purdie, of Edinburgh; Dr. Watson and Mr. Anderson, of Travent; Mr. Aikman, of East Linton; Mr. Smith, of Denny; Mr. Rae, of Stonehouse; Dr. Scatliff, of London; Mr. Dixon, of Watlington; Dr. Gilchrist, of Dumfries; Deputy Surgeon-General Gunn, Surgeon-Major Lynn, and Dr. Forsayeth.

Dr. Forman, of Glasgow, who had been one of the earliest abstainers, was the proprietor and editor of the *Teetotal Mirror*, a fortnightly publication, with its habitat in Glasgow, devoted to the advocacy of the cause. The first number appeared on 16th January, 1838, and the last on 24th January, 1839.

Time fails me to enumerate the long list of medical worthies who have since kept up, with unbroken continuity and ever increasing volume, the line of temperance apostolical succession. Two names in this undaunted band command attention. Well do I remember, in the Free Church of Scotland Assembly at Edinburgh in (I think) 1856, the late Professor James Miller boldly declare that, in his opinion, the greatest stumbling block to the temperance reformation was total abstinence; but twelve months had barely elapsed ere this noble-minded Christian surgeon stood up, at the next meeting of that very Assembly, to confess his error and urge the claims of abstinence on the assembled fathers and brethren. His burning zeal and eloquent tongue, combined with his eminence in the profession, had a marked effect on the progress of our movement. Many renowned physicians and surgeons have since that time come over to our side, notably Professor Rolleston, of Oxford, and Sir Henry Thompson, of London; but

"the noblest Roman of them all,"

the high priest of hygiene, a man honoured no less by popular acclaim than by the world of science, is the illustrious Dr. Benjamin Ward Richardson. An original investigator—for to no one are we more indebted for what accurate knowledge we have of the action of the alcohols—his scientific attainments, with that classic diction of which he is so consummate a master, have won for our cause a position it had never been within sight of before.

In every phase of the temperance reform medical men have participated. Dr. Grindrod suggested and presided at the formation of the first English organisation in 1835; Dr. Richmond aided in the foundation of the societies at Paisley and Glasgow in 1832; and Dr. Menzies, of the Scottish Temperance League, at Falkirk in 1844. There were several medical men at the launching of the United Kingdom Alliance in 1855, and a doctor, who was the first honorary secretary of the Glasgow Abstainers' Union, in 1854 proposed and instituted the well-known and wondrously successful Saturday Evening Concerts in the City Hall there. On the directorate of the original Coffee Tavern Company have been from the first two members of the profession, who are also on the provisional council of

Digitized by Google

the Coffee Music Hall Company; and throughout the kingdom disciples of Hippocrates are actively engaged in every department of temperance effort. To medical men the movement for legislation for habitual drunkards is indebted for its conception and persistence. Two of the most valuable contributions to the Wine Question have come from the profession. Barry, in 1775, published a work (31) which has been a mine of wealth to all inquirers after the truth regarding Bible and ancient wines; Henderson, half-a-century later, presented a complete cyclopædia of oino-historic lore and facts (32); Grindrod and other physicians have added largely to the literature of this important subject (33).

The three well-known Declarations concerning alcohol merit special mention. The first was drawn by Mr. Julius Jeffreys in 1839, and was signed by Sir B. Brodie, Sir Jas. Clarke, Sir J. Eyre, Dr. Marshall Hall, Dr. A. T. Thompson, Dr. A. Ure, the Queen's Physicians, Professor Partridge, Professor Quain, Mr. Travers, Mr. Bransby Cooper, and seventy-eight leaders in medicine and surgery. This document declared the opinion to be erroneous that wine, beer, or spirit was beneficial to health; that man in ordinary health required no such stimulant, and could not be benefited by the habitual employment of such in either large or small quantities; that, even in the most moderate doses, alcoholic drinks did no good, while large quantities (such as by many would be thought moderate) sooner or later proved injurious to the human constitution, without any exceptions.

The second Declaration was originated, and the many signatures published, by Mr. John Dunlop in 1847. More than 2,000 of the most eminent physicians and surgeons signed this, including Sir B. Brodie, Sir J. Clarke, Sir W. Burnett, Sir J. Forbes, Sir H. Holland, Sir A. Munro, Sir J. McGrigor, Sir R. Christison, Dr. W. B. Carpenter, Dr. Copland, Dr. Niel Arnott, Dr. A. Farre, Professors Guy, Allen Thomson, Miller, McLeod, Easton, Anderson, Mc Farlane, Rainey, Buchanan, Paris, Winslow, Alison, Syme, Henderson, Lawrie, McKenzie, R. D. Thomson, Couper, and Simpson. This certificate set forth that perfect health is compatible with total abstinence from all intoxicating beverages; that all such drinks can, with perfect safety, be discontinued either suddenly or gradually; and that total and universal abstinence from alcoholic liquors and intoxicating beverages of all sorts would greatly contribute to the health, the prosperity, the morality, and the happiness of the human race.

The third Declaration, which was prepared by Professor Parkes, on the suggestion of Mr. Ernest Hart and Mr. Robert Rae, in 1871, was signed by 269 leading members of the hospital staffs. Among those signing were Sir Geo. Burrows, Sir Thomas Watson, Sir H. Holland, Sir William Fergusson, Sir James Paget, Sir Ronald Martin, Sir Henry Thompson, Sir Duncan Gibb, and Sir James Bardsley. This Declaration, recording the widespread belief that the inconsiderate prescription of large quantities of alcoholic liquids by medical men had given rise to intemperance, urged the need for medical practitioners to prescribe these liquors only under a sense of grave responsibility; that alcohol, in whatever form, should be prescribed with as much care as any powerful drug, and that the directions for its use should be so framed as not to be interpreted as a sanction for excess, or necessarily for the continuance of its use when the occasion was passed.

Few seem to be aware that, at its very beginning, the temperance movement was powerfully aided by a large number of local declarations signed by the leading practitioners in the various districts. Between 1830 and 1833 declarations setting forth the evils of the most limited habitual use of ardent spirits were signed by the medical men of, among other places, Dublin, Edinburgh, Bradford, Berwick, Kilmarnock, Leeds, Cheltenham, Brighton, and Bristol (34); while the Manchester practitioners testified that the habitual use of all intoxicating liquors was not only unnecessary but pernicious (35). As far back as 27th December, 1790, the College of Physicians of Philadelphia memorialised the Senate and House of Representatives of the United States on the pernicious effects of distilled spirits upon the health of the people, stating that their habitual use, in any case whatever, was wholly unnecessary, and that they neither fortified the body against the morbid effects of heat or cold, nor rendered labour easier or more productive (36).

The Physiology of Alcohol.

To the literature of the physiology of alcohol the medical profession has contributed largely. M. Courten, of Montpelier, showed, in 1679, by the hypodermic injection of sp. vin. rect., that the alcohol of white wine has practically the same poisonous effects as the alcohol of distilled spirits (37).

Early in the eighteenth century Dr. Cheyne gave a clear and graphic exposition of the bodily and mental mischief wrought by intoxicating drinks, and commended the superiority of abstinence over moderation mainly on the ground that, through their physiological action, all such beverages, even when taken in limited quantities, have ever a tendency to create a craving for more. In his expressive language "drops beget drams, and drams beget more drams." Elsewhere he says of fermented liquor used socially, "as a common beverage it is a slow and certain poison" (49).

Dr. James, in 1747, exposed the fallacy that alcoholic drinks promote digestion (40); and Dr. Darwin, towards the close of the century, classed alcohol as a poison, wrote of its use as a luxury as pernicious, and held it to be "the principal, if not the only agent, in the production of gout and gravel" (41).

In the second year of the present century Beddoes enunciated the great truth—"the injury from any fermented liquor is to be measured by the quantity of alcohol or ardent spirit which is to be obtained from it on distillation" (42). From the experiments of Pilger on the lower animals, and from his own observations on man, Beddoes came to the conclusion that fermented and distilled liquors were inimical to digestion, and a constant source of chronic indigestion (43).

Trotter, in 1804, showed that sudden abstinence was not only perfectly safe, but was the only method for the curing of the drunkard; and that to nursing mothers and to the young alcohol was especially hurtful (44).

McNish, some years later (45), denounced the drinking of malt liquors by nursing women, showing that the irritant and narcotic properties of alcohol are communicated to the child through the milk. He also showed how men, indulging habitually day by day, without producing any evident effect on either body or mind, and fancying themselves strictly temperate, were "undermining their constitutions by slow degrees—killing themselves by inches, and shortening their existence several years" (46).

Dr. Beaumont, of the United States, conducted a remarkable series of experiments—from 1825 till 1833—on a young Canadian who had an unhealed gunshot wound in the walls of his stomach, with the result that "the whole class of alcoholic liquors, whether simply fermented or distilled, may be considered as narcotics, producing very little difference in their ultimate effects on the system," and that these liquors retarded digestion and produced irritation and inflammation of the gastric mucous membrane, even when St. Martin felt no symptoms of discomfort (47). Dr. Dundas Thompson and Dr. Henry Munroe (48) verified these conclusions at a later date.

In 1814 Prout found (49) that all alcoholic liquors, even diluted, diminished the quantity of carbonic acid expired, and Fyfe shortly afterwards confirmed Prout's conclusions, as also have done Schultz, Vierordt (50), and Edward Smith (51).

In 1839 Percy found alcohol in the brain of a dog killed two minutes after the administration of the poison (52), while Dr. Lewis (53) and Dr. Kirk published cases occurring in their practice corroborating Percy's experiments on the lower animals. Dr. Ogston added yet further confir-

Digitized by Google

mation to the proposition that alcohol penetrates at once to the brain through the medium of the blood (54).

Schultz in 1842, Virchow in 1853, and Boecker in 1854 (55) showed that alcohol, in even moderate doses, cuts short the life period of the blood corpuscles, and alters the character of the blood, loading it with fatty globules and with retained effete matter.

Davy was the first to demonstrate the influence of alcohol in lowering the temperature of the body (56); Lees enforced the accuracy and importance of this fact (57); Henry Brown admitted it in 1858 (58); Richardson in 1865, Binz (59), and Ringer (60) have by elaborate experiments confirmed it, Richardson giving the doubters the *coup de grace*.

Liebig, in 1843, while admitting that alcohol possessed no alimentary principles (61), contended that it was decomposed in the system, and was, though to a limited extent, a heat giver (62).

In 1860, Lallemand, Perrin, and Duroy published the conclusions to which they had come after a very long and painstaking investigation (63), holding that alcohol was eliminated from the body unchanged.

An animated and lengthened controversy ensued, in which Baudot (64), Trousseau (65), Schulinus, Edward Smith, Anstie, Thudichum, Dupré, Subbotin, Richardson, and others took part; and the present state of our knowledge is that a portion of the alcohol taken has been demonstrated to pass out of the body unchanged (66), while we are in total ignorance of what becomes of the remainder.

Alcohol was held to be a paralyser by Grindrod in 1837 (67), by Schultz in 1842 (68), by Lees in 1843 (69), by Brown in 1858 (70), and by Edmunds in 1867 (71).

The remarkable series of experiments on a healthy man of twenty-six years of age, by Parkes and Wollowicz (72), showed that the action of the heart is enormously increased under alcohol, so small a quantity as one ounce causing that organ to beat 4,300 times more in the twenty-four hours.

Though great light has been thrown on the phenomena of alcoholism by Wilson (73), and Sewell (74), Lee (75), Youmans (76), Hammond, Davis, and others in America, and (especially on the differential action of the various alcohols) by a host of Continental practitioners, we know as yet little or nothing of the chemical behaviour of alcohol in the living frame.

But we do know enough of its effects to warrant us in affirming, with Thudichum and Dupré, that "alcohol is a poison even in small doses" (77), and with Sir Wm. Gull, that it is the "most destructive agent known to us in this country" (78).

The very few physiologists who argue that alcohol has any food power admit that this is a very low power, while all are agreed in classing alcohol as an irritant narcotic poison.

In the enlightenment of the professional and public mind Dr. W. B. Carpenter's splendid prize essay, in 1849, played no mean part (79). His indictment, on physiological grounds, of all habitual drinking is unanswerable.

It is an act of simple justice to state that nearly all the opinions now held by the highest scientific authorities were anticipated and formulated by a gentleman who is not a member of the medical profession. The temperance movement would have been in a very different position to-day had it not been for the research, learning, and popular exposition of the action of alcohol, for which we are indebted to Dr. F. R. Lees, of Leeds. No language can express my sense of the obligations we all owe to Dr. Lees for his masterly criticisms of the productions of a long succession of medical antagonists, and for his unrivalled contributions to the literature of alcohol. From 1839 till the present time he has lectured on the science of temperance all through the land, insisting from the first on the narcotic, benumbing, paralysing action of alcohol; and he anticipated by twenty years the chief and most certain principles now all but universally accepted by genuine physiologists. His definition of food in its three aspects has been adopted in the recent great work of Baer, of Berlin, on "Alcohol" (80). Not the least valuable of Dr. Lees' services to temperance physiology was his translation and popularisation of Lallemand, Perrin, and Duroy, an undertaking which moved the scientific world of Britain to its very centre.

Alcohol as a Medicine.

George Cheyne (81), James (82), and Trotter (83), all denounced, in no measured terms, the routine medical prescription of intoxicating liquors, the latter insisting on alcohol being given in drops like tincture of opium. In later times Higginbottom, Bennett, Beaumont, Mudge, and Nicholls carried on extensive practices while dispensing entirely with beer, wine, and spirits; Collenette and many others are still alive pursuing a like course; and there are now several workhouse infirmaries (84) and parochial districts, as well as a Temperance Hospital, where the medical officers prescribe no alcoholic beverages. At the recent national medical meeting at Cork there was a strong feeling expressed by nearly all the speakers in a discussion (described by the president of the section, Dr. Andrew Clark, as the most satisfactory discussion he had ever listened to) on alcohol in fever, that alcohol must be prescribed with as much care as any poisonous drug. The agitation on the administration of alcohol in workhouses and other public institutions, which is penetrating from one end of the country to the other, has been the work of members of the medical profession.

Present Attitude of the Profession.

The National Temperance League, by conferences during the past nine years with medical men, did much to prepare the way for the young and promising British Medical Temperance Association. Dr. Richardson's accession to the presidency of the Association, and the distribution of his inaugural address, with a blank form of application for membership enclosed, to the whole profession (18,000 in number) have increased our numbers from thirty-five a few months ago to over 200. I had the honour, in the name of this vigorous society, of recently entertaining at Cork the president, officers, and leading members of the British Medical Association. The venerable president of this "annual medical parliament," Professor O'Connor; the president of the council, Dr. Alfred Carpenter; the secretaries, Professor McNaughton Jones and Dr. Ringrose Atkins; and the editor of the *British Medical Journal*, all commended our efforts, and bade the Medical Temperance Association a hearty Godspeed.

The quarterly *Medical Temperance Journal* contains the proceedings of this new professional abstinence society, and ought to be read by every intelligent friend of the great and good cause we all have at heart (85).

Besides the 200 who have openly avowed their abstinence by joining the Medical Temperance Association, letters received from many doctors who desired to record their thanks for Dr. Richardson's address indicate that there are probably as many more who are personal abstainers, but who are not yet prepared to become members of any temperance society. This is an immense advance, and is but an earnest of the coming rapid spread of the practice of abstinence throughout the medical profession; for the history of this great and self-denying class has ever shown that, rising above all personal and sordid considerations, once their conscience is aroused and the path of duty made clear, nothing will be allowed to stand between them and unflinching loyalty to

"The message of a truth Divine,
The call of God from heaven."

RICHMOND SURGICAL HOSPITAL.

Cases under the care of Mr. WILLIAM STOKES, Surgeon to the Hospital.

Fibroid Enchondroma of the Palate—Excision—Recovery.—A boy, æt. 8, was admitted into the Richmond Hospital under my care last February, having been recommended to me by Dr. F. O'Farrell. The parents of the youth informed me that he had never complained of anything in connection with his throat until about six weeks previous to his admission into the hospital, when they observed a sudden change in the quality of his voice. On opening his mouth they perceived a large prominence occupying the greater portion of his palate. The boy was well-nourished and healthy-looking, and had never suffered from anything except the usual affections of infancy. There was no history in his family of scrofula or cancer. On examination, the tumour was found occupying mainly

Digitized by Google

the left side of the palate, and did not pass, but merely overlapped, the mesial line. It was very vascular, and numerous vessels were observed ramifying over its surface. The boy suffered nothing from difficulty of deglutition, nor from any impediment to respiration through the left nostril. No obstruction was found in the pharynx. There was no evidence of fluctuation, but the tumour was decidedly elastic, and some portions of it were considerably denser and harder than others. At these parts I felt distinct, apparently cartilaginous, nodules. It was more or less irregular, and the surface of it varying in consistence. The mucous membrane over it moved freely on the tumour. In front of it was a depression which was the result of a small excoriation or ulceration. There was no hæmorrhage from it at any time. A point of practical importance in the case was to determine the origin of the tumour, whether it grew from the base of the skull, from the root of the nasal fossa, from the hard palate, or in the soft palate. The nature of any operative procedure would have had to be determined on to a great extent with reference to the situation of the origin of the tumour, and, therefore, it was all important to determine this important point. After consultation, I resolved to make an incision over the tumour, and, if possible, to remove it without making any external wound. Accordingly, I made a free incision over the anterior aspect of the tumour, and proceeded to dissect the mucous membrane off the tumours. I found that it was not at all adherent to the tumour, and having detached the mucous membrane to a great extent from it, I was enabled to pass my finger round, and eventually succeeded in enucleating and removing it. I found it had no attachments to any of the neighbouring osseous structures. I was not at any time of opinion that it took its origin from the base of the skull, in consequence of the absence of difficulty in passing a catheter or probe down through the nasal fossa; but I had been of opinion that it was probably attached to the horizontal plate of the palate bone or palate process of the superior maxillary bone, in which case I should have had to split the hard palate, before removing the tumour. I found, however, that it was essentially in the soft structures of the palate, and, in fact, lodged in its substance. On making a section of the tumour after its removal, I found it very firm, consistent, elastic, and rather more dense towards the centre than the circumference. Dr. Harvey, Pathologist to the Hospital, examined the growth, and found it to be composed of fibrous tissue over a cartilaginous matrix. The greater portion of it might be described as a fibroid enchondroma. "It has also," he states, "masses of round cells, evidently of a recent growth, and of a more or less sarcomatous nature."

I may mention that there was very smart hæmorrhage for a short time after the operation, but no vessel had to be ligatured; the hæmorrhage was easily checked by pressure, and the application of cold, the wound rapidly closed and united, and the patient shortly afterwards returned home perfectly well.

Translations.

HYSTERIA MAJOR.

By Professor CHARCOT,
Physician to the Salpetrière Hospital, Paris; Member of the Academy of Medicine of France; Fellow of the Clinical Society of London, &c.

Abstracted by T. M. DOLAN, F.R.C.S.Ed., Halifax, Yorks. (a)

(Concluded from page 205.)

We are naturally led by what precedes to the study of imperfect forms or varieties of hystero-epilepsy.

M. Charcot admits that an attack of hystero-epilepsy may be modified in two principal modes:

1. *By extension or predominance of one period at the expense of the others.* Thus are produced:
   a. *Epileptoid attacks.*
   b. *Demoniacal attacks.*
   c. *Attacks of ecstasy.*
   d. *Attacks of delirium.*
2. *By mixture of foreign elements with the fundamental constitution of the attack*, such as, for instance, somnambulism and catalepsy.

a. *Varieties by predominance of one of the periods.*

1st Variety—Epileptoid form.—

The attack of hystero-epilepsy is found, in this variety, reduced in some manner to the first period, to the exclusion, more or less complete, of other periods. The epileptoid phase may be repeated so as to simulate true epilepsy with all its appearance of gravity, but the employment of the various methods used to modify an attack of hysteria, causes the disappearance of these terrible convulsions, and confirms the hysterical nature of the malady still more; on closer examination some convulsive phenomena belonging more particularly to hysteria will be observed. Such are: movements of circumduction at the commencement of the tonic phase, swelling of the neck, persistence of contraction during the phase of evolution. In the interval of the epileptoid fit we often see a trace of the other periods, as the beginning of the *arc de circle* or of the attitudes of passion. We see nothing similar in true epilepsy. Finally I must recall to mind the absence of thermic elevation which is always noticed in true epilepsy.

2nd Variety—Demoniacal form.—This variety is principally constituted by the predominance of the second period, clonism, major movements, and diminution of the other periods. The contortions assume an exaggerated development, justifying the term which Charcot has given to this variety. The patients reproduce, as regards the leading features, the descriptions which have been left by the authors of the "possessed" of ancient days. The limbs turn and twist in the most fantastic attitudes, the distortion of the features, and protrusion of the tongue, render the physiognomy frightful; many extend the three first fingers of the hand so as to simulate the gestures of the *jettatura;* frightful cries and attacks of rage complete the horror of the scene. The first epileptic period is often represented in this form by some peculiar convulsive phenomena, but the other periods are habitually absent.

3rd Variety—Attacks of Ecstasy.—The attacks have been described by classic authors, but they have not been attached in general to a fundamental type. Yet Briquet thus expresses himself: "The attacks of ecstasy may be produced in two ways. Sometimes they are preceded by ordinary preludes of spasm or hysterical convulsions, so that ecstasy is only one of the incidents in the attack; at another time the patients fall suddenly into ecstasy without any prodromata." This variety may be produced experimentally by inhalation of ether. It is constituted by the predominance of the third period, or of attitudes of passion, preceded sometimes by some epileptic phenomena, which are then the seat of the malady, but the attitudes of passion may show themselves in a state of complete isolation. It may be reduced to one attitude, more or less prolonged; the state of ecstasy is then produced.

4th Variety—Attacks of Delirium.—This is the delirium of the fourth period, some epileptoid phenomena being often added at the onset. The patient delivers addresses, prophecies, &c. The prophetic dissertations of the convulsionnaires of Saint Médard may be considered as an example of this variety.

b. *Varieties of Hystero-epilepsy by mixture of Cataleptic or Somnambulic phenomena.*—Catalepsy and somnambulism, the characters of which have been studied in a previous lecture, often occur spontaneously in hysteria without showing any apparent relation with a previous attack. Briquet considers catalepsy as a neurosis completely distinct, although bordering on, hysteria. But the two states may be met with in the same patient, and the phenomena of catalepsy and somnambulism added to the convulsive attack. Observations of this kind are not rare. Amongst other memoirs the observations of M. M. Ernest (*Archives General of Medicine*, 1860) and of M. Moinenet (first fasciculus of the "Transactions of the Medical Society") will be read with interest. It will there be seen that attacks of catalepsy and somnambulism habitually commenced in the patients, noticed with violent hysterical convulsions. Catalepsy and somnambulism often occur after convulsions when the patient has completely re-

(a) *Progrès Medical.*

Digitized by Google

covered the use of her senses. This has been noticed by Charcot in his town practice.

It seems that when the phenomena of catalepsy and somnambulism complicate an attack, they succeed to the first or second period, replacing the third. It is interesting to recall to mind how the *début* of catalepsy or somnambulism is generally marked by some epileptoid phenomena (hissing inspiration, movements of deglutition, foaming at the mouth, &c.), which are reproduced almost in the same manner at the same moment when the patient emerges from the state into which she has plunged.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 10, 1879.

"AN INCREDIBLE STORY."

WELL might Mr. T. J. Nelson, Chairman of the Lower Thames Valley Main Sewerage Board, give this title to the facts narrated in the letter which he has recently addressed to the Earl of Beaconsfield. If the public wish to have some idea of the bungling, time-serving, and short-sighted policy, as well as the gross mismanagement, which have for years characterised the proceedings of both central and local authorities in respect of the great and imperial questions—the disposal of sewage and the purification of the Thames—they have only to read the able and trenchant pamphlet we have just received, the general purport of which we purpose to lay before the reader.

There was a time when all the places situated between Lechlade and Putney were compelled to spend large sums of money in carrying their sewage into the Thames. Soon afterwards, however, an Act of Parliament was passed to compel these same places, under heavy penalties, to discontinue the practice. It was, as Mr. Nelson says, a very arbitrary step, but they were helpless. London insisted upon having the Thames as a source of water supply; and as the Thames Conservancy sold the right to take this water to the water companies for a large sum, London and the Thames Conservancy treated the river above London as their own property "irrespective of any injustice to the towns, or the heavy burdens they put upon the ratepayers." But, while in 1867 all passage of sewage into the river was forbidden to these towns under a penalty of £100 a day, the Legislature had granted them no powers to dispose of their sewage. Nevertheless, town after town did all in its power to comply with the law. Kingston led the way; and, as that town had already been attacked in Chancery by the Conservators, with all possible speed the authorities looked about, and eventually found a spot admirably adapted to deal with the sewage. When, however, they asked the Government to sanction their scheme a host of objectors appeared; and after spending some £900, for which a special rate had to be made, the Government put a stop to the scheme. Far worse was the case of Richmond. This town, before it took its sewage into the Thames in obedience to the law, had desired to use it on some land belonging to the Crown, but had been refused permission; it had now to take it out of the river, after spending £20,000. Its attempt to comply with the new law shared the same fate as that which befell Kingston. Then the latter town, nothing daunted by its past failures, and determined not to be defeated by landowners' opposition, purchased a hundred acres of land, and arranged with its neighbours, Surbiton and Hampton Wick, to take the sewage there. "Again the official inquiry was held; again objectors appeared; again the Government refused applications;" while the ratepayers had not only to pay for the costs of the inquiry, but for the land purchased, which remains on their hands to this day. In the meantime Richmond was sued by the Conservators of the Thames for the penalties they had incurred in breaking the law. The unfortunate ratepayers had to pay the penalties and costs; "but," observes Mr. Nelson, "the Richmond sewage flows into the river to this day, for there are some things which even an Act of Parliament cannot do." Nor were Kingston and Richmond the only places desirous of complying with the law. Kew, Barnes, Mortlake, Esher, Heston, and Isleworth, have all made earnest but fruitless applications to the Local Government Board. Waste of expenditure was the only result, the last inquiry alone, that at Esher, costing £1,000. The rest of the story, which for want of space we cannot adequately describe, is more "incredible" than that already told. The Surbiton Improvement Commissioners suggest a comprehensive scheme which meets with great favour in influential quarters, but eventually they are obliged to retire from the field. The Thames Conservators commence taking proceedings to recover penalties against various places. Hampton Wick is summoned for penalties amounting to £98,000! A joint board is the outcome of this extraordinary demand. Three years from Michaelmas, 1877, is given to the board to accomplish its work, which, owing to various insurmountable obstacles thrown in its way, it fails to do. It flies to Parliament for assistance. After much agitation some 294 persons out of a population of 110,000 petition against a Bill drawn up

Digitized by Google

in favour of the Board, which is of course lost on a division by 168 noes to 146 ayes. The joint board had undertaken a most laborious task in endeavouring to carry out the order of the Legislature. They had engaged the assistance of most able experts. They had, after much consideration, fixed upon a scheme to which various eminent engineers, agriculturists, and sanitarians gave their cordial support. But with all this the board failed in accomplishing the purpose for which they exist, and at Michaelmas, 1880, the suspended penalties will become due, and something like one million of money be enforceable against the unfortunate ratepayers.

Such is the sort of battledoring and shuttlecocking that has been long going on between one corporation and another, between local authorities and ratepayers on the one hand, and Parliament on the other. And a very expensive and discreditable game it has been. Joint boards in their anxiety to comply with the law, dragged into a court of justice and fined in costs to the extent of thousands of pounds, ratepayers compelled to pay heavy rates which, for all the good they did, might as well have been thrown into the sea. Local authorities compelled by Parliament to take the sewage of their respective districts out of the Thames, then prevented by the same Parliament to deposit it anywhere else, and finally sued by the Thames Conservancy for not doing what was utterly out of their power to accomplish! It is evident, however, that this state of things cannot last long. The pollution of the river by the sewage from large populations cannot be much longer permitted if London still insists upon drawing its chief supply of water from that source. It seems to us that from first to last a wrong course has been pursued. It was scarcely right for the Legislature to have thrown the responsibility of keeping the river free from sewage contamination upon various small towns, unless the way was clear for them to otherwise dispose of it.

Perhaps the difficult problem of effectually disposing of the sewage of large towns, and preventing the pollution of rivers, will not be solved until Parliament takes the matter into its own hands, and, guided by a Commission of Inquiry and the advice of able experts in engineering, chemistry, and sanitary science, fixes upon some great and imperial scheme that will settle the question once and for ever. In the meantime we have to thank Mr. Nelson for the able manner in which he has told his story, and we would advise the reader to peruse the pamphlet itself for a more particular account of the facts detailed therein than we have been able to give.

OPIUM IN THE NURSERY.

A LONG time ago we drew attention to the mischief arising from the improper feeding and drugging of infants and young children, especially those who are unfortunate enough to be brought up by hand. The evil extends to a great and deplorable extent amongst the poor, but on the occasion above referred to our remarks were entirely confined to the perils to which those infants of well-to-do parents were exposed who are left to the tender mercies of unprincipled nurse-maids. Several cases had come under our notice, in which we were confident that disorder of the nervous system had been induced by the abuse of some soporific, and serious derangement of the stomach and bowels by improper feeding, and we are surprised that the subject has not attracted more attention than it has. A few days ago, however, there appeared in the columns of the *Daily Telegraph* a letter from "A Mother who has suffered from Opium in the Nursery," in which she asks —"Can no legislation restrict the extensive sale of opium in the guise of 'soothing syrups, &c.,' and thus check the most pernicious practice, too common amongst nurses, young and old, of secretly adminstering opium to infants entrusted to their care?" We again say that the evils of which "A Mother" very justly complains exist to an almost incredible extent, and, no doubt, "if the confession of an infant opium eater, could find intelligible utterance,' the revelations would be of a startling nature. There is not, however, the least chance of any legislative measures putting a stop to this mischievous practice, as the quantity of laudanum required at a time is so small that it would be easy for an unscrupulous nurse-maid to evade any law on the subject, however stringent that might be. The remedy must rest partly with the mother herself, and partly with the family medical attendant. As far as the middle and upper classes of society are concerned the practice of drugging infants with opiates is chiefly confined to those families in which the infant is deprived of that maternal care and solicitude which it should naturally enjoy, and the want of which it is sure to feel in some form or other. When the maternal visits to the nursery are few and far between; when the time that should be devoted to her offspring is spent in a round of pleasure or idle dissipation; and when mothers (as is too often the case) never think of supervising the artificial feeding of their children, they must not wonder if, during the night, drowsy nurses try, by fair means or foul, to get rid of the pain and sleeplessness which have been caused by errors of diet during the day.

Nor is "A Mother who has suffered," &c., far wrong in saying that the "low, irritative, febrile state thus produced is so similar to that resulting from errors in diet that, even when fatal convulsions follow, the real cause of illness may remain unsuspected by a skilful physician." We admit that the secret drugging of infants by their nurses is a more common practice than people imagine, and that, moreover, the family physician often overlooks this possible cause of some of the infantile complaints for the treatment of which his services are required. Nevertheless, is it not evident that, in many cases, the unnatural symptoms and bad health of which "A Mother" speaks are to be in a great measure attributed to a more remote cause than that of "soothing syrups" and other like narcotics—that, in fact, the evil complained of often arises from conditions over which mothers have more or less control? If a child is in good health it will stand in need of very little medicine to make it sleep. A nurse, unless very evily disposed, does not, out of pure wantonness, drug her infant to sleep, and the probability is that she has passed many sleepless nights, and that her infant charge has been long ailing, before relief has been sought for in the lethal drops. A disordered state of the stomach and bowels, induced by improper or over feeding, the irritation of dentition, want of exercise in the open air, and the neglect of common clean-

Digitized by Google

liness—these are among the more common causes of those infantile troubles which drive the nurse to the laudanum bottle, and which might be for the most part prevented, or greatly lessened, if mothers belonging to the middle and upper classes of society were only to give a little more personal attention to the feeding and general hygiene of their infant children than they are in the habit of doing.

Notes on Current Topics.

A Counterblast for the Anti-Vivisectors.

THE address of Dr. Pye-Smith on the subject of vivisection is already so familiar to the profession that it is hardly necessary for us to express our entire concurrence and approval of what he said on the subject. But we think it worth while to put a few of his remarks on record in our columns in order that the fanatics who are still possessed with vivisectophobia may have the opportunity to read and mark. Dr. Pye-Smith said:

"Certain persons who professed to be shocked by the methods of physiological research, had succeeded in placing biology under great disabilities. The method that had given rise to so much excitement was the performance of experiments upon living animals. Now, if this were injurious to the greatest good of the greatest number of the community; or if freedom to perform these experiments interfered with the freedom of other persons to abstain from them; or if such experiments were forbidden by any religious or moral authority—by the Ten Commandments, or by Mr. Matthew Arnold—of course they must be given up; but equally, of course, the science of physiology must come to a stop; and the farmer, the cattle-breeder, and the physician must be content with such knowledge or such ignorance as he at present possesses. What was asserted was that, within restrictions which all humane persons impose upon themselves, it is lawful to inflict pain or death upon animals for profit, or for sport, for money or for pastime; that property and sport are in England sacred things; but that the practices which they justify are unjustifiable when pursued with the object of increasing human knowledge or of relieving human suffering." He then proceeded:

"Of those persons who answer that they consider vivisection for the sake of sport to be almost as detestable as vivisection for the sake of duty, I would only ask, first, that they should deal impartially with both offences; and secondly, that since in the one case their opinions are opposed to the practice of genteel society, and in the other to the convictions of all who are qualified to judge, they should at least contemplate the possibility of being mistaken. Putting the question of field sports altogether aside, you know perfectly well that in every village in England an extremely painful mutilation is constantly performed upon domestic animals in no registered laboratory, under no anæsthetics, and with no object but the convenience and profit of the owner. You remember how, when an epidemic threatened the destruction of valuable property, every booby peer now eager to stop, so far as in him lay, the advance of knowledge, was no less eager to have carried out at the public expense any slaughter and any experiments, painful or otherwise, which would save his pocket. But you will say, 'All this seems reasonable enough;' but if so, how do you account for the prejudice against you; what has induced so many amiable and otherwise sane persons to join in the outcry against physiology? First, I answer, it is due to the most frequent cause of folly—ignorance. Many persons supposed to be educated are so destitute of the most ordinary conception of natural science, that they do not understand the necessity for experiments. Next, there is the vulgar dislike of whatever is not obviously and immediately useful. When knowledge for its own sake is in question, those of the baser sort are always ready to cry, with equal ignorance of literature and of science, *Cui bono?* In another class of persons, less ignorant, and less stupid than these two, opposition to physiological experiments appears to spring from what may fairly be stigmatised as sentiment—that is to say, excitable, rather than deep feeling, uncontrolled by reason. This sentiment is, I admit, the degradation of just feeling. To many unaffectedly compassionate hearts there is a peculiar pang in thinking of suffering which is deliberately inflicted, with only the justification of duty, instead of the excuse of ignorance or passion. They see in the helplessness of the dumb animals an appeal for pity, almost like that of childhood, and are justly indignant with the selfish cruelty so often exercised upon them. All honour to the efforts which have banished so many cruel sports from England; all honour to the Society which seeks to prevent cruelty to animals! If it can point to any additional means by which the sufferings of the animals in the cause of science can be diminished, we shall be anxious to adopt them. If it can point to any abuse in one of our laboratories, we will hasten to correct it. This Society has honourably declared that they knew of none. That physiologists have been heedless, or even callous, in their experiments upon animals in past times, when men were strangely insensible even to human suffering, or in countries where a healthy result of Christian civilisation had not yet been seen in habitual gentleness to animals, I need not deny. I have hitherto rested the whole argument upon the lawfulness of inflicting pain and death upon the lower animals for the sake of science and humanity; but, as a matter of fact, I may again assure those who, while assenting to the justice of the plea, yet shrink from what it may involve, that the great majority of experiments upon animals are rendered painless, and that the remainder are mostly those experiments which are most immediately and directly subservient to medical art, and which, happily, are generally productive rather of discomfort than of pain"

The Use and Abuse of Examinations.

WE have already more than once endeavoured to control the tendency manifested by medico-educational reformers to outstrip discretion by the aggrandisement of examination and the depreciation of curriculum, as relative methods of ascertaining the competency of medical men, and we avail ourselves of an article published by the *Pharmaceutical Journal* of the 30th ult., to confirm our views on the subject. We see before us, in truth, a disposition doubly dangerous, because we are on the eve of a reconstruction of the system of medical education—to depose the hospital surgeon and the dissecting-room

Digitized by Google

teacher, and to enthrone in his place the examiner, who will "make up" his pupil to pass a given examination in the briefest time, by the shortest cut, and with the least practical teaching or thoughtful study which can be made to suit the requirement. There are many reformers who insist that before or beyond the examination no one has a right to go, and that it should not be asked how, where, or for what period the student "got up" his pass knowledge, if only he *can* pass, a doctine against which it is our purpose now to protest.

The *Times* has within the last few days directed attention to some of the evils of the examination system, and it has done good service by insisting upon the mischief likely to arise from the modern tendency to make examinations the sole test and crown of all processes of education. The *Pharmaceutical Journal* agrees with the opinion that this tendency entirely distorts every rational view of what education is and should be. But this is a result attributable more to the circumstance that too much faith has been placed in the virtue of examinations than to the absolute worthlessness of examinations as a test of merit, capacity, and attainment; it is a result of the misuse of examinations that has led students to look upon the passing of them as being of more importance than the acquisition of sound knowledge, that has led teachers to devote their energies to the production of manuals by which superficial proficiency can be readily acquired, and candidates enabled to pass the ordeal of examination without its being really that test of educational training that it was designed to be.

The exaggerated application of the examination system has not operated as a stimulus to sound and thorough education, but has rather called into existence and created a demand for facilities for passing examinations without undergoing the preparatory educational labour necessary for acquiring a proficiency in the subjects. In this way the pupil has been made a mere racer and one who contends for heavy pecuniary stakes, while the teacher is made a trainer whose whole prosperity depends, not on his power of imparting sound knowledge and drawing out the natural capacities of the mind, but on his skill in preparing his pupils for a particular examination.

We would add to this view that, as matters of medical education stand, an examination which could be depended upon as a test of knowledge is impossible. It is quite conceivable that a man might be an excellent lawyer who learned his business by the aid of books and a crammer, and who never knew anything of the daily work of courts or solicitors' offices; or he might be a most capable and earnest divine, who had never left his study or engaged in semi-clerical work; but ours is an art in which eye and finger are as much concerned as mind, and we cannot be content with any guarantee of knowledge which does not testify that the practical work of the profession has been personally studied. We do not believe that any examination contained within practical limits can give us such a guarantee, and we therefore repudiate at once the plea of licensing bodies, which urge that their examination is sufficient atonement for the faults of their curriculum, and the proposals of those who would encourage the student to forget the hospital-ward and the dissecting-room, and to put his trust solely in the grinder and his books and plates.

Foreign Bodies in the Vagina.

THE *Journ. de Méd. et de Chir. Pract.* relates a curious case of a woman, æt. 36, who consulted a medical man for an attack of menorrhagia which had lasted ten days, and which had been accompanied with great prostration and severe colicky pains. On making an examination a substance was discovered in the vagina; and on further inquiries the patient confessed that when she was 14 years old she had introduced a reel of thread. She had already suffered from attacks of peritonitis and menorrhagia; and after this foreign body was extracted, an urethro-vaginal fistula was found to be present. The reel itself was black, and the central canal through which the menstrual fluid had always passed was clear. But the most remarkable fact in the case was that this patient had been twice married, and had been under the care of medical men, and that she had succeeded in concealing the existence of this foreign body (which was two centimetres in length), both from her husbands and from her physicians.

Magnesia and Intestinal Concretions.

ONE of the purgatives (says the *Courrier Méd.*), most frequently employed as a domestic remedy is undoubtedly the carbonate of magnesia. As its action is mild it is generally considered a very safe purgative, but nevertheless its long continued use is attended with certain inconveniences which should not be lost sight of. A patient of M. Blondeau's, who had been taking daily four teaspoonfuls of calcined magnesia in his coffee, has been suffering from the formation of numerous and very hard intestinal concretions chiefly composed of that drug. In another patient under the care of M. H. Gueneau de Mussy, the abuse of this medicine led to the formation of an intestinal concretion which gave rise to actual obstruction of the bowels, and had to be removed from the rectum by mechanical means. This physician has known a case to terminate fatally from the same cause. Pereira also mentions in his work on "Materia Medica" (vol. i., p. 645), a case in which, on a post-mortem examination, a calculus of magnesia was found in the colon weighing as much as four or five pounds, The use of magnesia has also been said (Mercier, Ed. Labbé) to be capable of developing renal or vesical calculi.

Diseased Animals and Bad Meat.

THE recent convictions before the metropolitan magistrates for the hawking of uneatable meat about the streets remind us of a little pamphlet just published by Mr. Francis Vacher, Medical Officer of Health for Birkenhead, "On the Diseases of Animals which do not necessarily render them Unfit for Food." In this interesting and instructive *brochure* Mr. Vacher classes the diseases of animals under three heads: (1) Those which undoubtedly render the meat unfit for the food of man; (2) Those which depreciate the quality of the meat, or make it preternaturally liable to decompose, but which do not necessarily, except in their later stages, render the meat unfit for food; (3) Those which do not depreciate the quality of the meat or increase its liability to decompose, and rarely render the meat unfit to be eaten. The diseases classed under the first head are cattle-plague, swine-

Digitized by Google

typhoid, epizootic pleuro-pneumonia, sheep-pox, normal cow-pox, influenza, acute rheumatism, the scarlatina and quinzy of swine, splenic fever and anthrax, and the diseases known by the presence of cysticerci and trichinæ. The diseases under the second heading, and which in their later stages may render the meat unfit for food are, foot-and-mouth disease, hoof-rot, tuberculosis, acute inflammatory disease of the lungs, intestinal canal or serous sacs, jaundice, cardiac dropsy, nephria, enthetic disease, and the three parasitic diseases of sheep due to the presence of the *cœnurus* in the brain, the *echinococcus* in the lungs and liver, and the *distomum* in the liver. With regard to the first-mentioned in this list, Mr. Vacher says, "If the carcase you are called upon to inspect has been the subject of epizootic aphtha only, even though the eruption be abundant on the mouth, feet, and udder, it is generally considered it may be safely passed. The flesh looks good, and is. 'It is frequently sold on a large scale, and as there is no instance of such food producing any ill effects, there appears to be," as Mr. Fleming observes, "no reason to interdict its use as an article of diet, so far as the production of disease is concerned." Mr. Vacher, however, mentions certain conditions under which a carcase should be at once condemned. With regard to tuberculosis, the writer would pass the carcase when the disease is uncomplicated and in an early stage, and when there are deposits in the thorax only. In the case of such purely inflammatory diseases as pneumonia and pleuro-pneumonia, unless the disease is epizootic or far advanced, it affords no grounds for condemning the subject of it. But peritonitis, unless circumscribed, is usually regarded as sufficient ground for condemning a carcase. Cardiac dropsy confined to the serous cavities, and considerable inflammation of one or both kidneys, are also consistent with a tolerably wholesome carcase. With regard to that common disease in sheep called "the rot," and which owes its origin to the *distomum hepaticum*, or liver fluke, Mr. Vacher says, that in judging of carcases from which flukes are removed, the simplest course is to take no notice of the flukes, but to look to the condition of the carcase. If the flesh is soft and pale, and the fat wanting in firmness, if the muscles are much wasted, and the cellular tissue œdematous or emphysematous, and if the liver is knotty and friable, the sheep is not fit for human food. The consideration of the third class may be dismissed in a very few words, as the diseases mentioned are merely such trifling complaints as obviously would not render the meat unwholesome.

Hospital Saturday in London.

The annual collection amongst *employés* of firms and in the streets of London in aid of the various metropolitan hospitals, infirmaries, and dispensaries took place last Saturday. As early as five o'clock in the morning the first detachment of collectors started upon their errand in Billingsgate, Covent Garden, and the Metropolitan Meat Market. The general commencement, however, was between eight and nine, at the latter of which hours every prominent position in the metropolitan thoroughfares was occupied with a table holding a box labelled "Hospital Saturday Fund," and bearing the appropriate hint, "It is a duty to give." In the afternoon there were special performances in Regent's and Victoria Parks by the bands of the 9th (West) Middlesex Rifles, and of the park, at which collections were made. Besides the 280 collection boxes, the committee had issued no fewer than 30,000 forms to various large firms, railway companies, docks, police, workmen's clubs, friendly societies, vestries, board-schools, the Post Office, Inland Revenue Department, and the Royal Mint, at which arrangements were made for subscriptions. In the evening collectors were posted with boxes at all the metropolitan theatres, music-halls, and other places of amusement, the consent of the proprietors, and their co-operation having in every case been cheerfully given. Last year the total receipts for the fund were £6,502, of which £1,090 was the result of the sheet collection, this being a total increase of nearly £800 over the receipts of the previous year. The amount distributed amongst the 61 hospitals, 31 dispensaries, 3 convalescent homes, and 1 Surgical Appliance Society that participated, was £5,000, the expenditure having been £1,272, or 19·56 per cent. of the total amount received. The street collection has gradually increased year by year, and the much larger demand this time than on any previous occasion for subscription-sheets leads the committee to hope that the net result of 1879 will show a great stride, notwithstanding the depression that has so long existed in trade generally throughout the metropolis.

The Metropolitan Water Companies.

From a report recently issued on the metropolitan water supply we learn that all the companies are moving in the matter, and giving constant supply under the provisions of the Metropolis Water Act, 1871, in a portion of their districts, except the Southwark and Vauxhall and Grand Junction Companies. For example, the West Middlesex Waterworks are giving constant supply to a number of houses on the application of the owners and are fully prepared to extend the system as required; they are also compelling the adoption of this system by all new estates and buildings under the above Act; and already the whole of the Queen's Park Estate in the Harrow Road, South Kensington, and Earl's Court Estates, are under the same system; where new services are laid down constant supply is made compulsory by the Company. Moreover, the East London Company are proceeding with the construction of an entirely new set of works at Lea Bridge, which comprise four filter beds of one acre each in extent, and a pair of compound engines of 100 nominal horse-power each. These works were commenced last year and are making rapid progress, and by the end of this year will be completed. The company will then be able to give a better supply to the higher parts of their district throughout.

With regard to the quality of the water supplied, it is said that owing to the bad condition of the water at the intakes and the prevalence of floods caused by the almost incessant rains of July, filtration has been again attended with much difficulty. The Thames water delivered by some of the companies was much polluted by organic matters, and was not fit for dietetic use. The deep well waters delivered by the Kent and Colne Valley Companies, and by the Tottenham Local Board of Health, had not been affected by the heavy rains. It was as

Digitized by Google

usual clear and bright, and of excellent quality for dietetic purposes. Seen through a stratum two feet deep, the water was clear and colourless. The water supplied by the Kent Company is taken from chalk wells, of which there are 3 at Deptford, 1 at Plumstead, 2 at Crayford, and 2 at Shortlands. It is not filtered, but is clear, colourless, sparkling, and remarkably free from organic impurities. Its analysis, as made by Dr. Albert J. Bernays, gives (in grains per gallon) total solid matter, 32·720; chlorine, 1·700; ammonia free, none; ammonia albuminoid, none; nitrogenous nitrates and nitrites, 0·399; total hardness, 20·900; permanent hardness, 7·650. The population supplied by this Company is about 280,566, and the quantity of water delivered daily is not restricted. The estimated population supplied by all the water companies is 4,206,238.

Late Suggestions on Ozæna.

Dr. Frankel, in Virchow's *Archiv*, gives a number of cases which he thinks will confirm the views of those who believe that ozæna always owes its origin to a dyscrasia—two of his patients were phthisical, two syphilitic—but does not believe, though admitting the frequent coincidence of ozæna with pharyngitis sicca, that both the diseases are in causal connection with each other.

In an Italian contemporary, Dr. Massei, starting from the theory of a parasitic origin of ozæna, recommends the following treatment: *a.* Gradual dilatation of the obilterated nasal passages by means of elastic bougies; *b.* Clearing and disinfection of diseased regions by a very weak solution of salicylic acid (1 part 500 parts of water), applied by means of a syringe; *c.* Modifying local medication, by blowing calomel powder through a nasal speculum on the ulcerated surfaces. The author says that there is always an arrest in the process of healing at a certain period, but advises strongly not to give up this treatment, but to continue it patiently until total cure is obtained.

In the *Memorabilien*, Dr. Dawosky describes his successful treatment of that form of ozæna called *punaisie* (in German, *stinknase*). He carefully removes all crusts, washes the mucous membrane with a two per cent. solution of silver nitrate, and every evening tampons the nostril with a plug of charpie as thick as the finger, moistened with glycerine and that thickly dusted with powdered alum. In the morning this is removed and nostril washed with injections of permanganate of potash or zinc, in weak solution. The odour soon disappears, and by persistence a cure is effected.

Mr. Holloway, "of the Pills."

Mr. Holloway, according to *Nature*, "has purchased and vested in trustees ninety-five acres of land at Egham, upon which he intends to erect a building for a college, the object and scope of which is to be to afford the best education suitable for women of the upper and upper middle classes. The contract for the building of the college within four years has been signed, the price being upwards of £250,000, exclusive of fittings. It is the founder's desire that power for the college to confer degrees should be sought at some future time, but that meanwhile students should qualify themselves to pass the women's examination of the London University. 'Denominational theology' is not to be taught, and instead of being regulated by the 'traditions and methods of former ages,' the system of education is to be mainly based upon studies and sciences which the experience of modern times has shown to be most valuable and best adapted for the intellectual and social requirements of the students. Mr. Holloway has also agreed to provide an endowment fund of £100,000, in addition to such proceeds as may be derived from the sale of any portion of the land not required for the purposes of the college."

The Inhalation of Oxygen in Anæmia.

Everybody knows how difficult it is sometimes to get some much enfeebled chlorotic patients to take reparatory aliments, so great is their disgust for all azotised aliment, vomiting often ensuing when they attempt to eat meat. Some women live upon a little bread and salad, and the quantity of urea they eliminate is then very small, sometimes as little as from four to six grams in the twenty-four hours. In such women treatment becomes very difficult, it being nearly impossible to reproduce appetite in them. In these cases Dr. Hayem, of the St. Antoine Hospital, Paris, employs a means which has furnished most excellent results, and which consists in the daily inhalation of oxygen. The appetite soon returns, the vomiting disappearing at the same time; and so well do the patients then support azotised aliments, that the four regular "portions" of the hospital diet scale become insufficient.

Tests and Preservation of Surgical Instruments.

The following directions are from a work in preparation by Dr. Smith, of Philadelphia:—

The *tests* of the quality of instruments are as follows: Draw a cutting instrument from heel to point slowly across the *border* of the nail, and it will catch or stop at every "nick;" draw it across the *flat* of the nail, and if at any point the edge is seen to be wiry or smooth, it is soft, and must be reapplied to the hone; but if it becomes serrated, like a fine saw, the edge is brittle, and cannot be remedied by the hone. For pointed instruments, stretch upon a test drum (a contrivance for the purpose for sale by instrument makers) a very thin piece of kid, or gold beater's skin, and push the point through. If it enter smoothly and easily the point is good; but if a slight crackling noise is heard it is defective. If a lancet is tested, see-saw the edge in the opening, and if it glides over without cutting, or cuts roughly, the edge is imperfect.

The *preservation* of instruments in good condition requires careful attention to the following details: Select a place always free from moisture and dirt, for their safe keeping. Polished instruments should be suspended or placed in velvet-lined cases. After being used, every instrument should be thoroughly cleaned with warm water, and perfectly dried with chamois, or the fire, before it is returned to the case. Silver instruments tarnish when they are exposed to the air, or are brought in contact with hard or soft rubber, caustics or acids. To

Digitized by Google

preserve the edge or polish of instruments, the surgeon requires two or three small hones, some fine emery paper, two or three screw drivers, small files, rouge crocus, or other polishing powder, chamois, and gold beater's or kid skin. Cutting instruments should have their blades kept in perfect order by the judicious use of the hone. Occasionally the blade must be ground by a competent workman. Blunt instruments, which are designed to enter natural or other passages, should be frequently polished with fine emery paper, and then with rouge and chamois skin, in order to remove every particle of rust, and to maintain smooth unblemished surfaces. Saws are sharpened with three-cornered files, applied in the direction of the original cut of the teeth.

THE death-rate last week throughout the United Kingdom was again very low, averaging as low as 11 per 1,000 of the population in Portsmouth, the highest being Manchester and Leeds with 23 per 1,000. The other large towns were proportionately healthy, Glasgow reaching but 17, Edinburgh 18, London 20, and Dublin 21 per 1,000. Small-pox seems, for the present, to be almost stamped out. But one death in Dublin and seven in London were reported last week, and not one in any other part of the Kingdom.

CONTRASTED with the mortality of the principal foreign cities, our own rates at the present time are very favourable. In Calcutta the death-rate per 1,000 of the population is 24, Bombay 30, Madras 27; Paris 23; Brussels 25; Amsterdam 20, Rotterdam 22; The Hague 23; Copenhagen 22; Stockholm 25; Christiania 20; St Petersburgh 29; Berlin 33, Hamburg 24, Dresden 23, Breslau 29, Munich 35, Vienna 23, Buda-Pesth 34; Rome 29; Naples 30, Turin 30; Alexandria 36; New York 39; Brooklyn 26, Philadelphia 23, and Baltimore 23.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

GLASGOW AT THE CORK MEETING.—Though not numerically largely represented at the recent meeting of the British Medical Association in Cork, Glasgow may at least be fairly congratulated on the contribution of its full share to the *medical logic* ventilated there, and reproduced, we hope for the edification of members of the Association, in the *British Medical Journal*, of August 30th. Conspicuous among the Glasgow representatives were Dr. McEwen, still knocking away with his knock-knees, and fresh from his instructive case of laryngotomy at "the Royal." There were, of course, our two restless specialists, Dr. Wolfe and Dr. Paterson Cassells, the former ever ready with a new theory, and one likely to catch the newspaper eye; the "pupil of the late James Hinton, of London, and of Weber-Liel of Berlin, and of Professor Politzer, of Vienna, airing his thread-bare papers and his French exercises. Increasing knowledge seems to sit uneasily on this distinguished specialist. Dr. Wolfe was quite up to his usual average of intelligence and originality in his paper on the "Injurious effects of Tea-Drinking Habits upon the Nutrition of the Eye-Ball." The attention of the learned author was "specially directed to the affection by its frequent occurrence among Australians who came to consult him." We are scarcely sufficiently alive to the presence of men of such distinction creeping out and in amongst us in this grossly commercial city. Unfortunately for Dr. Wolfe's discovery two practitioners from Australia "had *not* observed any eye-symptoms produced by tea-drinking in Australia," and as there was no Turk present, the "rarity of the softening of the vitreous humour" in "the unspeakable" had to be taken for granted. One would have thought that Dr. Wolfe would have found some confirmation of his charming theory in "the Heathen Chinee," but he seems to draw the scientific line at "pig-tails," and the "flowery land." Is it not possible that the Mohammedan religion may have something to do with this Turkish immunity from so unfortunate an infirmity, the eye being so often directed towards Mecca? A Glasgow surgeon (we have the authority of Dr. Wolfe for it) had made some observations "as to the effects of tea-drinking on the healing of wounds and ulcers," and he noticed "that in persons addicted to this habit, they took on a sort of scorbutic character." Seriously, if this is a specimen of the "science" on which the British Medical Association justifies its being the "leader" of professional thought, it is fast bringing medicine into well-merited contempt. Dr. Cassells is well-known as a most enthusiastic worker in his own branch, and at the Cork meeting he was fully employed. In the discussion opened by himself in the Otological Section, he informed his auditors that "for many years in his earliest practice as a specialist he carried out the teaching" of the great men, the hem of whose garments he is never tired of touching, until it philosophically dawned upon him to reflect "after a few years" of such practices, "with what object he was using them, and what were they expected to do!" Thi seems a very honest guage of the value of not a little specialism. Dr. Cassells' other papers are already familiar to the members of the Medico-Chirurgical Society of Glasgow; and if they have never afforded much original research they have, at least, demonstrated the acute rise and full fruition of aural specialism. Gynæcological science and antisepticism were represented by Dr. Hugh Miller, and he was expected to have exhibited the "apron," but report has it that, like the Bambino, it is at present out on hire; and hence the Glasgow Maternity Hospital is shut owing to puerperal fever. Verily we congratulate the Glasgow profession.

ABERDEEN.—CELEBRATING A DOCTOR'S JUBILEE.—Dr. Lyon, early last month, completed fifty years' practice of his profession in the Culter district, and on the 30th ult. he was entertained at dinner in the Imperial Hotel to celebrate his jubilee. Dr. Fiddes, Aberdeen, presided, and Dr. Davidson, Wartle, and Dr. Greig, Fyvie, officiated as croupiers. The party numbered about forty, and included medical men belonging to the city and county of Aberdeen, as well as several representatives from Kincardineshire, while a number of apologies for absence were sent from England, Forfarshire, Elginshire, &c. In proposing the toast of the evening the chairman spoke in suitable terms of the professional skill of their guest, and of the esteem in which he was held by all who knew him. Dr. Lyon made a graceful and feeling reply. A very pleasant and happy evening was spent.

DEATH-RATE IN GLASGOW.—The deaths in Glasgow for the week ending August 30th, were at the rate of 17 per 1,000 per annum, against 17 in the preceding week, and 21, 22, and 21 in the corresponding periods of 1876, 1877, and 1878.

MEDICAL OFFICER'S REPORT, GLASGOW.—Dr. Russell re-

Digitized by Google

ported as follows to the meeting of Town Council held on the 1st inst. :—During the fortnight ending 23rd August there were 350 deaths registered, as compared with 339 in the fortnight preceding, being an increase of 11, representing a death-rate of 16 per 1,000 living—same as the rate in the same preceding period. The number of deaths of persons aged below 1 year was 79 in place of 74, and of persons aged 60 years and above, 47 in place of 54, as compared with the preceding fortnight. The number of deaths from pulmonary diseases was 111 in place of 103, representing a death-rate of 5 per 1,000, and constituting 32 per cent. in place of 30 per cent. of the total deaths. The number of deaths from fever was 7 in place of 6, viz., 2 from typhus, and 5 from enteric fever. The number of deaths from infectious diseases of children was 20 in place of 11.

Registrar-General's Returns.—The weekly return of births, deaths, and marriages in the eight principal towns of Scotland for the week ending Saturday, August 30th, says: The death-rate in the eight principal towns during the week ending with Saturday, the 30th August, 1879, was 17·1 per 1,000 of the estimated population. This rate is 2·7 under that for the corresponding week of last year, and exactly the same as that for the previous week of the present year. The lowest mortality was recorded in Aberdeen, viz., 12·8; and the highest in Paisley, viz., 29·8. In Perth the rate was 23·4. The mortality from the seven most familiar zymotic diseases was at the rate of 3·1 per 1,000, being 0·5 above the rate for the previous week. Diarrhœa was the only disease in which an apparent increase occurred. Sixty deaths resulted from acute diseases of the chest, being 12 less than the number recorded during the previous week.

Health of Edinburgh.—For the week ending August 30th the deaths in Edinburgh numbered 73, and the death-rate was 17 per 1,000. 30 of the deaths were due to affections of the chest. Only 1 death from fever was recorded, and that was a child in the new town. Of the 126 births, 13 were illegitimate.

Edinburgh Town Council.—Public Health Committee.—A meeting of the Public Health Committee of the Edinburgh Town Council was held on the 2nd inst., when the medical officer of health submitted reports showing that the death-rate of the city for July was 17·66 per 1,000 of the population, and for August, 15·26 per 1,000. In his report, the medical officer directed special attention to the unusual absence of diarrhœa, which, he explained, accounted for the remarkably low death-rate at this season. The absence of diarrhœa, it was further pointed out, was attributed by medical men to the low temperature which had been experienced, it being now a recognised fact that as the temperature rose the number of such cases increased.

Literature.

MUTER'S PHARMACEUTICAL AND MEDICAL CHEMISTRY. (a)

We are not surprised that Dr. Muter's book has so soon reached a second edition; for a more satisfactory work of the kind could not be placed in the hands of the pharmaceutical student. Having recognised the somewhat inconveniently large size of the first edition, the author has now divided his work into two portions. The one part containing all the practical matter, is collected together for use in the laboratory, under the title of "An Introduction to Analytical Chemistry," while the other portion is that including all the theoretical and descriptive part of the subject. Moreover, both parts of the work are considerably improved and extended, while the so-called "organic" portion has been made partially distinct by relegating it to the concluding chapters.

In the first volume, the first five and twenty pages are devoted to some introductory remarks on general chemistry, on the theories of chemical action, and the modes of expressing the same by formulæ and equations. This plan is to be commended, as it enables the student, should he be unacquainted with the general principles of chemistry, to thoroughly understand the nature of the decompositions which take place during the preparation of the various substances afterwards described. These descriptions, which extend through 250 pages of the first volume, are as good as they could possibly be for the class of readers for whom they are intended. They are remarkably clear, intelligible, complete, and withal concise. The only objection which the medical student might be inclined to make to this part of the work, is the order in which the author has treated and classified the numerous compounds used in medicine or pharmacy. Thus all the inorganic compounds are not, as is usually done, classified and described according to their basylous radicals, but according to their acidulous radicals. Thus, under the heading "Nitrogen," and the "Metallic Nitrates," we have a description of the preparation and properties of nitric acid, potassium nitrate, argentic nitrate, mercuric nitrate, and ferric nitrate. This arrangement necessarily leads to the separation of various important compounds of the same metal, which are not only generally, as they are in the Pharmacopœia, taken together, but resemble each other in their medical uses, and in many of their physical and chemical properties. Thus the numerous and valuable official preparations of Iron will be found scattered in various parts of the work—ferric chloride, in the beginning, in the chapter on "Fluorine and Chlorine," ferrous carbonate, about the middle, in the chapter on "Carbon," and ferric acetate, towards the end, in the chapter on the "Organic Acids." The inconvenience, however, which some students might feel from this method of handling the subject, is minimised by the presence of a copious index, and cannot for a moment be weighed against the general utility and many excellent points of the work. Besides, we may presume that this "Introduction" to Pharmaceutical and Medical Chemistry is chiefly designed for the use of the pharmaceutical students, as it is "arranged on the principle of the course of lectures on Chemistry as delivered at the South London School of Pharmacy."

A distinguishing and admirable feature of the volume under consideration, are the chapters devoted to the organic portion of the subject, and the good description that is given of organic compounds, alkaloids, active principles, &c. Thus, in the Chapter (xix) on the "Ammonia Derivatives," the student will find a clear and concise account of the volatile alkaloids, fixed or cinchona alkaloids, the alkaloids of opium, and those of nux vomica; while under the "Glucosides," (Chap. xx), are comprised such substances as salicin, elaterin, digitalin, santonin, jalapin, colocynthin, gelatin, aloin, &c.

To the student in practical pharmacy and analytical chemistry, there is no book that will prove more serviceable than Dr. Muter's "Introduction to Analytical Chemistry." This portion of the work, however, is so well-known and so generally appreciated, that it is scarcely necessary to "review" it in the ordinary sense of that term. The reader will remember that the arrangement adopted in treating of this part of the subject is such as to make the student's work in the laboratory comparatively easy, as well as instructive, so that with ordinary diligence, and with this book as a guide, he cannot fail to obtain a thorough and practical knowledge of pharmacy and analytical chemistry. "The Processes employed by Practical Chemists," the "Detection and Separation of the Metals," and the "Detection and Separation of Acidulous Radicals," are respectively considered in the first three chapters. The following three chapters are devoted to the qualitative analysis of official salts, the qualitative analysis of unknown salts, and the detection of the alkaloids; whilst the rest of the work is taken up with toxicological analysis, volumetric quantitative and gravimetric quantita-

(a) "An Introduction to Pharmaceutical and Medical Chemistry (Theoretical and Descriptive), arranged on the Principle of the Course of Lectures on Chemistry at the South London School of Pharmacy." By Dr. John Muter, M.A., F.C.S., &c., &c. Second Edition. London: Baillière, Tindall, and Cox, and Messrs. Simpkin and Marshall. Also:—An Introduction to Analytical Chemistry, being the practical portion of the above work, now issued separately for convenience in laboratory use. Second Edition, &c.

tive analyses, ultimate organic analysis, &c. In conclusion, we must not forget to congratulate the publisher on the capital style in which these volumes are got up. The character of the type, and the tint and quality of the paper, are alone some recommendation to the work, to say nothing of its contents.

IRISH SANITATION UNDER THE PUBLIC HEALTH ACT OF 1878.

We observe with much regret that the proceedings of the Irish Local Government Board and of the sanitary authorities throughout Ireland in relation to the Public Health Act of 1878 are eminently unsatisfactory and discouraging, and that we are justified in the apprehension that the latest effort to consolidate and simplify the sanitary organisation of Ireland is likely to prove an exemplification of "confusion worse confounded."

We are profoundly disgusted to find that the exit of Sir Alfred Power and the entrance of Mr. Henry Robinson to the presidency of the Local Government Board has resulted in no change of policy, and that the official influence of the department is still exercised—if not actually to obstruct sanitary reform—at least, to throw cold water upon the enforcement of cleanliness-law in Ireland. To comprehend the matter, a historical *resumè* is necessary. It will be recollected that, by the Public Health (Ireland) Act of 1874, the dispensary medical officers were created medical officers of health, and were charged with active sanitary functions analogous to those performed by their *confrères* in England. The first act of the Irish Local Government Board in pursuance of their determination to obstruct sanitation was to make sure that the medical officers of health should neither possess influence nor be stimulated to activity. The Board secured the first of these objects by issuing a proclamation to the sanitary authorities that they were, on no account, to pay more for the sanitary services of their officers than a small percentage of their dispensary salary; and their second purpose they achieved by stripping the medical officers—altogether illegally and without authority—of their title of "medical officer of health," and instead thereof, dubbing them sanitary officers, a title which was selected because it was redolent of subordination and of foul inspections.

Availing themselves with cordial alacrity of the hint thus given them by the Local Government Board the boards of guardians fixed for their medical officers of health, salaries of £3, £5, or £10 a year for the performance of duties for which analogous officers in England were paid £60, and they excused themselves for so doing by the plea that the Act was a novelty, and the duties of officers were not yet understood, and that they could easily increase the salary when the system was developed and the work to be done fully appreciated. It is needless to observe that in the great majority of instances the increase never came, and that most of the medical officers of health continue to receive the same £3, £5, or £10 which was voted them in 1874. The Local Government Board, with equal alacrity, confirmed these sham salaries, well-knowing that such payment meant no work, and that their purpose of obstructing sanitation would be fully served if they permitted the boards of guardians to vote the sum at which such village administrators were likely to value sanitary services.

The policy of the Local Government Board and of the Guardians was, however, for the first year of the operation of the Act, well nigh defeated by the energy of the medical officers of health who, though neither paid nor encouraged, set to work with zeal to reform the sanitary state of their districts. They inspected their districts, urged the inhabitants to cleanliness, planned sewage and water improvements, and made numerous reports of nuisances to their boards, and naturally looked for their reward in the approval of their masters and the improvement of their districts. But they speedily ascertained that they had earned no thanks by their trouble, and would probably earn enmity and unpopularity on the part of the members of their local boards, and that they could not by any amount of assiduity win approval from the L. G. B. They learned by experience that both the L. G. B. and the guardians considered sanitation a nuisance and an unpleasant responsibility, and being compelled by the Act of Parliament to have a medical officer of health, and to pay him something, were very earnestly desirous to pay as little as they could, and to be let alone.

As an inevitable consequence, the medical officers finding their reports and advice altogether disregarded by the guardians and deliberately tabooed by their superiors of the L. G. B., hastily retraced their mistaken step and ceased, in many instances, to perform any duties whatever, or even to pretend to any sanitary functions.

If the L. G. B., or any one else, doubts the truth of our statement, as a matter of cause and effect, we appeal to the Parliamentary return issued upon the motion of Dr. O'Leary, which set forth the number of nuisance reports made by sanitary officers in successive years following 1874. That return proves beyond the possibility of doubt that there was, and is, an enormous amount of sanitary work to be done in Ireland; that the medical officers of health were, and are, both competent and willing to do it; and that the obstructive policy of the L. G. B. and of the boards of guardians is the sole cause why the work has not been done, and why the Public Health Act has proved so miserable a failure.

But it was evident that sanitarians could not rest content with this state of affairs, and accordingly—as soon as it became obvious that the administration of the Public Health Act was a sham—an agitation was commenced to obtain a further reform. The Irish Medical Association engaged earnestly in this agitation, and—when a select committee of inquiry was granted—urged upon Parliament with great vehemence the changes which it thought necessary. The only change indeed was that the medical officers should be made to work—properly supervised and properly paid, and at length amendments of the Act were carried, which annulled the limitation of the medical officer's salary, and left it open to the Local Government Board and the Board of Guardians to encourage efficient sanitary work if they pleased. Throughout the inquiry the policy of the Irish Local Government Board was persistently hostile to every reform. Every difficulty was thrown in the way of a change for the better, and at length the Board succeeded in juggling itself out of the responsibility for supervision of sanitation.

It is our purpose to-day, without entering further upon the actual course adopted by the Local Government Board in connection with the Act of 18787 to protest most emphatically against the Board's proceedings. Charged by Parliament with the duty of notifying the change of law to the sanitary authorities, and of putting the new organisation in working order, it not only neglected to do

Digitized by Google

so, but positively refused to move until the prospect of Parliamentary punishment became imminent. Being then compelled—at the instance of the Irish Medical Association—to issue a general order as to the change of designation and increased duties of medical officers of health, it has done so in such form as to give the board of guardians to understand very distinctly that they are not expected to quicken their pace in regard to sanitation; that it is not incumbent on them to give any additional salary to their officers for the additional duty imposed; and that—in short—the less the sanitary authorities do in the way of public health reform, the better the Local Government Board will be pleased.

It is simply intolerable that a public department paid by Parliament to do its behests, and to carry into effect the law which it pleases the country to adopt, should take upon itself to counteract the intention of that law, and defeat its operation; and the course pursued by the Local Government Board in relation to the sanitary state of Ireland seems to us to afford no hope of a better policy, and to impose on all sanitarians the plain duty of making the Board responsible to Parliament. We shall look with anxiety for the first opportunity to appeal against the proceedings of the Board, and meanwhile we will take good care that the public shall not lose sight of the facts.

Endermic Use of Morphia by "Thimble Blistering."

This method is thus described by Dr. J. C. Watson, in the Virginia *Medical Monthly*—An ordinary sewing thimble, a little loosely picked up raw cotton, enough aqua ammoniæ (strong) to saturate the cotton without running out, are the preliminary agents required. Gently press the thimble over the selected spot until a sensation of heat has been felt for two or three minutes; wipe away any ammonia which may remain on the surface; now, with the finger, rub away the superficial skin; apply dry morphia by at first gently rubbing on, and then carefully adding a drop of water. A small quantity of morphia may be repeated at short intervals, until your patient feels its effects or is satisfied with the relief obtained.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

Dr. W. H. Pearse, Plymouth.—Communication, "Some Observations on Consumption," received, and will appear shortly.

Mr. Furneaux Jordan, Birmingham.—The subject is a delicate one, requiring careful yet vigorous handling, and we are much gratified to receive several notes of a similarly appreciative character to yours, for which please receive our thanks.

"Vivisection!"—Melancholy Barber (with a soul above his business): "I don't get much of a livin' by it, Sir!" Customer (through the lather): "Then—you ought—for you scrape—hard enough—for it!!"—*Punch.*

Dr. Cassidy, South Bend, and Dr. English, New Brunswick, will please receive our best thanks.

Dr. C. R. B.—Sorry we cannot add to our Exchange List; it is already too full.

Dr. Airy.—"Report of Outbreak of Enteric Fever in Chichester" received.

Dr. Thorne Thorne.—"Report on the Prevalence of Diphtheria in the Rural Sanitary District of Billericay" received.

Dr. Blaxall.—"Report on the Epidemic of Enteric Fever in Selborne" received.

Dr. Corry.—"Report on the Prevalence of Diphtheria in Cranfield and the Ampthill District" received.

Errata.—In our review of Dr. Thudichum's book the following very obvious misprint occurs: "Mosite" for "Inosite;" and for "theo-sulphuric" read "thio-sulphuric."

VACANCIES.

Abbeyleix Union, Ballyroan Dispensary.—Medical Officer. Salary, £100, with fees and Sanitary salary.

Alnwick Infirmary.—House Surgeon. Salary, £120, with furnished apartments, attendance, &c. Applications to the Hon. Sec. by Sept. 27.

Ardee Union, Collon Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, Sept. 18.

Portumna Union, Portumna No. 1 Dispensary.—Medical Officer. Salary, £100, with fees, and £12 as Sanitary Officer. Election, Sept. 20.

Richmond Hospital, Dublin.—Resident Surgeon. Salary, £50, with apartments, &c. Election, Sept. 11.

Shillelagh Union, Hacketstown Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Officer of Health. Election, Sept. 23.

Shillelagh Union, Coolattin and Clonegal Dispensaries.—Medical Officer. Salary, £100, with fees, and £15 as Sanitary Officer. Election, Sept. 19.

Sligo Union Workhouse.—Apothecary. Salary, £80.

St. John's Hospital for Skin Diseases.—Honorary Assistant Physician and Surgeon. Applications to the Secrerary at the Hospital. (See Advt.)

Tullamore Union, Clara Dispensary.—Medical Officer. Salary, £100, with fees, and £15 as Medical Officer of Health. Election, Sept. 24.

Westminster Hospital.—Pathologist and Curator of Museum. Salary, £52. Applications to the Secretary on or before Sept. 13.

APPOINTMENTS.

Baylis, C. O., M.D., Medical Officer of Health for the Bromley, Cranbrook, Maidstone, Malling, Sevenoaks, Tenterden, and Tonbridge Rural, and Beckenham, Bromley, Sevenoaks, Tenterden, and Tonbridge Urban, Sanitary Districts.

Bowring, G., F.R.C.S.E., Consulting Surgeon to the Manchester Royal Infirmary, on resigning as Surgeon.

Carter, R. W. F., L.R.C.P.Ed., L.F.P.S.G., Medical Officer for the Dunster District of the Williton Union, and Medical Officer of Health for the Dunster Sub-district of the Williton Rural Sanitary District.

Daniel, J., L.R.C.P.Ed., L.R.C.S.Ed., Resident Assistant Medical Officer to the Crumpsall Workhouse, Manchester.

Downes, A. H., M.D., Medical Officer of Health for the Chelmsford and Malden Rural Sanitary Districts.

Goyder, C. McIvhor, L.R.C.P.L., M.R.C.S.E., House Surgeon to the Sheffield General Infirmary.

Grimshaw, T. W., M.D., &c, Registrar-General for Ireland.

Kirsopp, T., M.R.C.S.E., Assistant House Surgeon to the Sheffield General Infirmary.

Neville, W. C., M.B., &c., Resident Assistant Master to the Coombe Lying-in Hospital.

O'Connor, T., F.R.C.S.E., Medical Officer of Health for the March Urban Sanitary District.

Pearson, T. R., M.D., Medical Officer to the Thornaby Iron Works, South Stockton-on-Tees, Yorkshire.

Thurnam, F. W., M.B., C.M., Assistant Medical Officer to the City and County Lunatic Asylum, Stapleton.

Unthoff, J. C., M.B., M.R.C.S.E., House Surgeon to the Sussex County Hospital.

Births.

Churchill.—On Sept. 4, at 4 Cranley Gardens, Kensington, the wife of F. Churchill, M.D., of a son.

Crawford.—On Sept. 2, at 29 Raglan Road, Dublin, the wife of Surgeon-General T. Crawford, M.D., Principal Medical Officer in Ireland, of a son.

Dodd.—On Aug. 25, at Killorglin, co. Kerry, the wife of W. H. Dodd, L.R.C.S.I., of a daughter.

Nash.—On Sept. 5, at 123 Lansdowne Road, London, W., the wife of Edmund Nash, M.D., of a daughter.

Marriages.

Cotterill—Wynne-Jones.—On Sept. 4, at Bodedern, Anglesey, J. M. Cotterill, M.B., F.R.C.S.E., to Mary J. Wynne-Jones, eldest daughter of the Venerable Archdeacon Wynne-Jones, of Treiorwerth, Anglesey.

Franks—Greene.—On Sept. 3, at Monkstown Church, co. Dublin, Kendal Franks, M.D., of Dublin, to Lina, eldest daughter of R. J. Greene, Esq., of Rochestown Avenue, co. Dublin.

Newman—Hutchinson.—On Sept. 2, at the Friends' Meeting House, Westminster, T. P. Newman, to Jane Elizabeth, eldest daughter of J. Hutchinson, F.R.C.S., of 15 Cavendish Square, London.

Deaths.

Broad.—On Aug. 30, at Anerley, James Broad, M.D., aged 42.

Carnley.—On Aug. 24, at 1 Charlotte Street, Hull, Henry Carnley, M.D.Lond., aged 50.

Nixon.—At Sligo, Henry King Nixon, L.R.C.S.I.

Norman.—On Aug. 29, at Colchester, John Norman, M.R.C.S.E., aged 69.

Russell.—On Aug. 27, at Herbert House, Denmark Hill, Wm. Smyth Russell, M.R.C.S.E.

Tatum.—On Sept. 5, at Eastbourne, Thos. Tatum, F.R.C.S., Consulting Surgeon to St. George's Hospital, London, aged 77.

PSYCHOLOGY AND THE NERVOUS SYSTEM.

By J. HUGHLINGS-JACKSON, M.D., F.R.S.,

Physician to the National Hospital for the Epileptic and Paralysed, and to the London Hospital.

(*Continued from page* 201.)

THE following quotations represent what Professor Tyndall said more than twenty years ago. It is difficult to see how he could repudiate the hypothesis of materialism more strongly, and yet he is the physicist previously alluded to who is supposed by many to hold that hypothesis :—

Tyndall.—" . . the passage from the physics of the brain to the corresponding facts of consciousness is unthinkable. Granted that a definite thought and a definite molecular action in the brain occur simultaneously, we do not possess the intellectual organ, nor apparently any rudiment of the organ, which would enable us to pass by a process of reasoning from the one phenomenon to the other. They appear together, we know not why."

The last quotation is given by Lewes, in his "Problems of Life and Mind," vol. ii., p. 458. Lewes adds—"To the same effect, Mill.: Logic, ii., 436. Du Bois Reymond; 'Uber die Grenzen des Naturerkennens,' 1872, p. 17. Griesinger: 'Maladies Mentales," 1865, p. 7. Donders in the *Archiv. für Anat. u. Physiol.*, 1868, p. 658. Lotze, *Microkosmus*, 1856, i, 161."

Laycock writes: "Under the guidance of text-books you will too often meet with useless metaphysics. You will read of 'palsy of the will;' that 'pain excites' this and the other; that 'the mind plays' upon the nerves like a performer on the keys of a piano; and therewith you will be led into fallacies in observation and practice. Now, the changes which, in nerve tissue, coincide with the evolution of energy or force, always result from the communication of force or energy to the tissue, and never from mere states of consciousness."—*Med. Times and Gazette*, Jan. 14th, 1871, p. 31.

We must remember well the last sentence; it implies, to take an example, that a movement of the arm, muscular contraction, is never started by an idea, but by a nervous discharge; liberation of energy by nerve tissue. Now let me quote a recent writer on physiology.

Herman.—"The human body, like that of any other animal, is an organism in which by the chemical changes of its constituent parts, potential energy is converted into kinetic energy."

This is a statement on physiology, not on psychology; but it applies just as much to those parts of the body *concerned with mind*, as it does to any other parts. It does not apply to mind at all; but to the parts of the nervous system which are the physical basis of mind. For observe what Herman says later on in his introduction.

"Finally, we must mention that in a part of the central organs, certain material processes . . . are accompanied in an *inexplicable manner*, with wholly undefinable phenomena, which characterise the *states of consciousness*."

How very different is this from the easy-going language which speaks without any thought of the distinction betwixt mind and its physical basis. Those who speak of an "idea producing a movement," seemingly find nothing "inexplicable;" all is simple. Observe Herman's word "accompany." We say that psychical states "attend" or "occur during," or "accompany" liberations of energy by nerve elements (or certain of them); but they are not those liberations, or, in other words, are not those nervous discharges. Is there any difficulty in understanding (I will not say in believing), that there is a physical series of liberations of energy, and a parallel series of psychical states? So when a person has an idea, there is at the same time a nervous discharge. Then, if a movement follows, that movement is not caused by the idea, but by the liberation of energy which occurs when we have that idea.

We do not say that the doctrine above variably stated is held by all thinkers. Mr. G. Lewes believes that feeling is a mode of motion. He writes as follows:

Digitized by Google

G. H. Lewes.—"The love of drawing sharp distinctions, the love of mystery, and the love of stultifying dogmatic confidence by an equally dogmatic scepticism, all unite in proclaiming the gulf between Motion and Feeling to be unbridged and unbridgeable. Here, at any rate Science, it is said, must acknowledge its impotence, however clearly it may trace the course of molecular movements from the excitation of a sensory nerve to its final discharge on a muscle; the transformation of a neural process into a sensation remains an impenetrable mystery. Motion we know, and Feeling we know; but we know them as utterly different; and how the one becomes changed into the other, what causal nexus connects the two, is a question which can never be answered."

"Such is the argument urged in a hundred different quarters. The force of it, when the facts are so presented, is irresistible. But are the facts correctly stated? "That the *passage* of a motion into a sensation is unthinkable, and that by no intelligible process can we follow the transformation, I admit; but I do not admit that there is any such transformation. When I am told that a nervous excitation is *transformed* into a sensation on reaching the brain, I ask, who knows this? On what evidence is this fact asserted? On examination it will appear that there is no evidence at all of such a transformation; all the evidence points to the very different fact *that the neural process and the feeling are one and the same process viewed under different aspects.* [Not italics in original.] Viewed from the physical or objective side, it is a neural process; viewed from the psychological or subjective side, it is a sentient process."—("Problems of Life and Mind," vol. ii., p. 459.)

Very possibly it may be asked by those who have noted my acceptance of the opinion that there is no interference betwixt psychical state, and physical state,—"Do you not believe that the mind influences the body?" I certainly do not, when the two terms are used rigidly, believe anything of the kind. I believe that the highest nervous centres, the substrata of mind, influence the lower centres, and thence the body; and also that the organs of the body—notably the viscera—and lower centres influence the highest centres. When a man is severely frightened suddenly he may be seriously shattered for life—become permanently hypochondriacal. But I do not believe that the emotion of fear affected his body, but that those excessive and sudden nervous discharges which occurred when he was frightened damaged those parts of the body which the nervous arrangements discharged represented. Among the physical changes going on during extreme and sudden fear are disturbances of most important vital organs; a condition akin to that occurring during shock from severe and sudden injury to a limb. Surely the physical disturbances suffice without invoking an immaterial thing, an emotion in explanation. Of course, one does not object to the expressions—"The mind influences the body;" "Pain raises arterial tension;" or "Fright produces this or that bodily condition," when they are used popularly, their real meaning being tacitly understood, any more than one does to the expression that "The kettle boils," or that "The sun rises in the East." But I should object to any explanation of day and night on the assumption that the sun really does rise in the East and passes over to the West, the earth not rotating; and I should object, in a scientific account of pain, to the statement that an excessive sensation raised arterial pressure in place of the statement excitation of a sensory (afferent) nerve raised arterial pressure.

Let me mention particular errors of theirs. (1) We may very easily suppose ourselves to take a materialistic view of mind, and yet follow the psychological method to all intents and purposes so far as medical inquirers are concerned. To speak of mental states as being nervous states, to consider cerebral centres as being ideational, perceptive, and so forth, if no further step be taken, is neither materialism nor psychology, but simply a mixture of both. To "solidify the mind," to talk of the brain as if it were a kind of mind made up of cells and fibres, is not enough in a medical inquiry. For the moment, granting it to be true, for argument's sake, so far as it goes, it does not go far enough for medical purposes. The statements are mixtures of morphology and psychology. Anatomy of the nervous centres is ignored in these morphologico-psychological statements. Morphology has to do with cells and fibres; anatomy deals with sensori-motor arrangements. The morphologico-materialistic statement is that mind is composed of cells and fibres; the anatomico-materialistic statement is that mind is made up of sensori-motor arrangements. Both these being here repudiated, the statement we make is that the physical *basis* of mind is sensori-motor, or in other words, that psychical states occur during, not from, sensori-motor nervous states.

Ignoring the distinction betwixt physical and psychical states leads to ignoring anatomy and physiology of the higher parts of the nervous system.

(2) It is very widely assumed that sensory nerves and centres are alone engaged during ideation or sensation, but it is very plain that a movement element also is represented in the substrata of tactual and visual images.

(3) Active states of sensory (afferent) nerves and centres are often spoken of as if they were sensations. It is a most unfortunate thing that the term Sensation (really the name of a psychical state) is of the same derivation as Sensory. It fosters the confusion that an active state of a sensory nerve or centre (a state of body) is a sensation (a state of mind). On this matter we may quote J. S. Mill.—"It is usual, indeed, to speak of sensations as states of body, not of mind. But this is the common confusion of giving one and the same name to a phenomenon and to the proximate cause or conditions of the phenomenon. The immediate antecedent of a sensation is a state of body, but the sensation itself is a state of mind."—Mill's "Logic," 8th ed., vol. ii, p. 436.

We are only justified in saying that sensations attend or occur during active states of sensory nerves and centres. Besides, there are sensations attending states of movement centres. Thus, whenever we see an object or think of one, we see it, or think of it both coloured and of some figure. There is a sensation of extension as well as of colour; this implies activity of both sensory and movement elements. As implied under (2), sensations are on the physical side, not sensory only, but sensori-motor. In artificial analysis we may speak of "motor sensations" and "sensory sensations."—*Vide infra.*

(4) Whilst nearly everybody admits ideas (images) and sensations are psychical states, having correlative nervous states, it is taken for granted that movements, of the face and limbs, for example, have no psychical side. But I think it is plain in one case that there is a psychical side to movements; thus, the most highly special and complex movements of the tongue, lips, palate, &c. (articulatory movements), have a psychical side in words or syllables. I shall extend this distinction to all movements, and at any rate, try to show that it holds good with regard to that I shall speak of as cerebral manipulatory and locomotor movements. I should call the psychical and physical sides respectively psychical—movement and physical—movement. Thus a word is a psychical movement; the highly special and complex articulatory movement (nascent or actual) is a physical movement. These terms will be defined later on. I suppose the idea contained in this paragraph is essentially that contained in the following excerpt from Sir William Hamilton:—

". . . The faculty of voluntary motion, which is a function of the animal soul in the Peripatetic doctrine, ought not, as is generally done, to be excluded from the phenomena of consciousness and mind."—Hamilton, "Metaphysics," vol. i., p. 157.

Here I may advert to the use of certain abbreviated expressions. When such an expression as *motor* sensation is used it is to be taken to mean sensation *attending* or *occurring during*, not from, energising of centres representing, by efferent nerves, movements of either epi- and ento-peripheral muscles; by the term "*sensory* sensation" is meant sensation *attending* or *occurring during*, not

Digitized by Google

from, energising of centres representing epi- or ento-peripheral surfaces by sensory, that is afferent, nerves. The expressions are used for brevity. Similarly I use the expression "*organised* sensation." The expression "psychical side of" and "physical side of" are used. If the reader asks "Side of what?" I have no answer to give. I use expressions I find in use as a means of distinguishing betwixt psychical and physical states. The meaning, physical or psychical, of such words as "light," "heat," &c., must be gathered from the context; in these cases we have but one name for the two correlative things; for what we call a mode of motion in a substance, and for the ensation attending a "mode of motion" of our organism which the mode of motion in that substance induces in us.

(To be continued.)

THE ADVANTAGES OF CALOMEL IN THE DISEASES OF CHILDHOOD, WITH ESPECIAL REFERENCE TO TYPHOID FEVER.

By E. MARLETT BODDY, F.R.C.S., F.S.S., ETC.

THERAPEUTICAL fluctuations (if I may so designate the various degrees of popularity or opprobium through which certain drugs have had to pass in the medical world) are as frequent now, if not more so, than half a century ago. Some have withstood the test, and have managed to maintain themselves in the good opinion of the profession for a longer period of time than others. Some have flourished for a brief space after being loaded with unbounded laudation as specifics, superior in every respect to any which may have preceded them; but after an evanescent renown, and an ephemeral existence, have disappeared, and are now comparatively forgotten. Others, which are but few in number, have contrived to keep their ground in spite of many which have sprung from the laboratory of the chemist, or from the forests of tropical regions, such as opium, rhubarb, jalap, calomel, &c. These have passed the "ordeal of fire," and have emerged, I may say, well refined; but peculiarly, they are considered by a great many as old-fashioned and obsolete, and accordingly are seldom, if ever, used. Perhaps for the reason that humanity has somehow or other undergone a change, and the drugs which were considered sufficient for the curability of diseases, which infected people of a bye-gone age, are now regarded as insufficient for those which are prevalent at the present time; or it may be such practice is of far too simple a nature in its working, and consequently does not tally with the scientific treatment of disease, the presence of which is, in very many instances, only discernible to the practised eye of a histologist.

Such method of treatment would undoubtedly be correct were the human organism changed from what it was years ago; but as I think such is not the case, those drugs which were found to be of such utility by our forefathers, and which has never been satisfactorily disproved, ought to be equally so to us, though science and investigation, and the multiplicity of minutiæ, have caused us to swerve considerably from the *utile*.

To a certain extent the constitutions of some adults do undergo a change, owing to the system becoming inoculated with a virulent animal poison, the effects of which modifies considerably both the physical and mental capacities of the individual; and therefore, perhaps other drugs of a more modern date are only applicable in the treatment of their diseases; but in infancy there is no like metamorphosis, for an infant of the present day is, to all intents and purposes (except those which are tainted with an hereditary disease), exactly similar to an infant born centuries ago, and consequently if a drug of a certain nature was then administered to them with advantage, such drug would have the same effect at the present day, notwithstanding the *dicta* of certain authorities.

Many drugs have been very severely condemned, as not only being of comparative worthlessness, but as being most pernicious to the well-being of the patient; of this class, the much abused calomel is a good specimen; perhaps it has escaped, to a certain degree, the first accusation; but it is still considered by a great many as a drug of a highly dangerous nature, and to be by all possible means avoided, not only in diseases which afflict the adult, but even in those which occur in infancy and childhood.

Some go so far as to say that calomel should not on any consideration be administered to an infant, lest the system should become mercurialised. I cannot make remarks of too severe a nature concerning this ridiculous fallacy, for being purgative in its action, how can such a result occur, unless it be given with a careless hand and injudicious judgment?

I have never known an infant to be mercurialised as the result of the administration of calomel in my own practice; others may have come across a case of infantile mercurialisation, which I must confess is not to be wondered at, when I call to mind the preparation of mercury which is almost invariably resorted to—viz., the hydrargyrum cum creta; such a result is easily accounted for when we take into consideration the antagonistic properties of the two ingredients. Mercury, we know, is a purgative, besides being a chologogue; chalk, we are aware, is an astringent, as well as being antacid; thus one manifestly counteracts the action of the other, and mercurialisation very probably occurs, simply because the mercury is prevented by the chalk from passing out of the system owing to the astringent effect which the latter drug has upon the alimentary canal; consequently, purgation is thwarted, and in many cases stopped altogether, which is not at all desirable in the treatment of infantile disease; and as a certain amount of this powder is given to the hapless infant every two or three hours, as the case may be, the bowels, instead of acting as they should, are repeatedly retarded, and as it is a rule to administer this anomalous compound when the infant is going through the protracted and painful process of teething, in order (as is supposed) to prevent convulsions, I have no hesitation in asserting that instead of obviating them, we, on the contrary, promote the attacks, and we make matters ten thousand times worse by preventing the action of the bowels. From what I have seen, I regard the administration of mercury and chalk as pernicious, unpractical, and unscientific. In support of this assertion, which may appear at first sight as of too sweeping a nature, we will just take a typical case in which it is thought desirable by the great majority of medical men to administer the hydrargyrum cum creta.

A child is brought suffering from convulsions originating from painful dentition; it cries, is restless, vomits up the milk, very likely refuses the breast, and perhaps is frequently convulsed, the face is puffy, and the tongue is white and comparatively dry, and the child very likely wheezes, which is supposed by many to indicate the presence of bronchitis. On inquiry, we shall find to a certainty that the bowels are not opened as they should be consistently with health.

A mixture is given, *pro forma*, and of course one of those invaluable powders consisting of the hydrargyrum cum creta is ordered to be given every two or three hours. If the child recovers we owe the happy result to "dame Nature," and not to the presumed efficacy of the powders, owing to the fact that the properties of one ingredient are antagonistic to the properties of the other. I am sure, and I could prove it by a great number of cases, that many more infants would recover were this injurious, though universal custom, of giving them the hydrargyrum cum creta departed from. Indeed, this practice of giving infants mercury and chalk is a proceeding diametrically opposed to common sense, and should be condemned as being pre-eminently unscientific, unpractical, injurious, and useless. It is unscientific because of the antagonistic

Digitized by Google

properties of mercury and chalk; it is unpractical because it is given to regulate the bowels, which it entirely fails to do; it is injurious, owing to the chance of mercurialisation resulting from its administration; and it is useless, because it falls considerably short of the object which it is intended to promote.

I have had many opportunities of seeing children while taking these powders, and I have known many succumb rather to their deleterious action than to teething or to convulsions, because the bowels are prevented from acting, owing to the fact that one ingredient neutralises the other, for the mercury is partially deprived of its purgative properties by the action of the chalk; and another mischief may be inadvertently set up, viz., the biliary secretion is increased by the mercury, and this, through the action of the chalk, is hermetrically sealed in the intestinal canal; thus we have two evils to contend with besides that for which the presumed remedy is given, viz., mercurialisation, and an over secretion of bile, which remains in the system, instead of being eliminated.

Therefore, of what practical utility is the administration of the hydrargyrum cum creta? Of what earthly use is the combination of mercury and chalk? Whoever would think, unless he was bereft of his senses, of valuing lead in preference to gold—of preferring a flint and refusing a diamond? Yet so it is. We administer an adulterated drug, which originates more evils than one, and ignore that which is sure to do good. Indeed, we prefer adulteration to purity, and alloy to the pure metal.

I trust I have sufficiently proved that the recognised practice of giving the hydrargyrum cum creta to children is not only injudicious, but decidedly injurious, as not only falling considerably short of the object we have in view, but the probability, on account of the astringent properties of the chalk, of our mercurialising the recipient.

As it is with adults in the majority of the diseases, so is it with infants; the bowels are more or less out of order, *i.e.*, the excreta are different to what they would be were the child in health. In fact, barring hereditary syphilis, infants as a rule suffer either from constipation or diarrhœa. On the average about ten per cent. suffer from other complaints, half of which are derived from some defect in the parents' constitutions, or from some congenital malformation; the other half from bronchitis, or other affections peculiar to the respiratory organs. So we thus see that the larger proportion suffer from some disorder of the bowels, which is far from being remedied by the administration of the hydrargyrum cum creta.

During dentition, especially when protracted, the bowels are to a certainty in a morbid condition, and as one evil naturally irritates the other, the tendency to convulsions originating from the teeth is of course aggravated by any intestinal disorder. One evil, if we may thus designate dentition, is generally remedied by the efforts of Nature alone; the other by medicine. One is comparatively healthful, the other pernicious; therefore the one which is adverse to the well being of the infant must be our sole consideration; the other may be left to work its own cure, for Nature is generally perfectly capable of completing what she begins, and when so, medical and surgical interference is meddlesome and harmful; but in some cases she is embarrassed, and requires the assistance of man, and then if help is afforded judiciously and in time, she proceeds with her work with a right good will, gets over the difficulty, and goes on as before. Thus it is with infantile dentition; it is what one may term an episode in infancy, a crisis in which Nature generally manages to get the upper hand; but sometimes the infant is weak, and the process is painful and tedious, the health begins to suffer, the little patient gets cross and irritable, and if not attended to, gets rapidly worse. The tongue is white, and the infant refuses sustenance; it whines when the abdomen is touched; the motions are *green* and slimy, and the odour is offensive; and the mother will very likely tell you that the child has the "gripes;" the feet are cold and damp, and the body and head are abnormally hot.

These symptoms vary but seldom; they are more or less present when an infant is teething, or when it is simply suffering from some intestinal irritation, and the same treatment therefore is to be followed out in all cases almost indiscriminately, necessarily excluding those dependent upon some organic origin; and the only drug which is really efficacious is calomel, and not the hydrargyrum cum creta.

A powder, therefore, consisting of calomel should be given at night time, the strength of which must depend on the discretion of the medical attendant; and the next morning a teaspoonful of castor-oil should be given, if possible, on an empty stomach. The attention should now be directed to the alvine excreta, which will continue *green* or olive till the child has regained its health; and when that result has been attained, they will resume their normal colour.

I must here draw the reader's attention to a most astounding error recorded in every book on materia medica, so that it has come to be regarded as a therapeutical fact; it is looked upon as one of the effects wrought by calomel, yet it is as complete a fallacy as ever was promulgated, and that no one should have discovered it to be such is really inexplicable; it is this, calomel produces green stools similar to mashed spinach; "it often produces in children the so-called calomel stools, or green-coloured fæces," says a certain authority. By this we are to infer that they are only produced by calomel, and that they are as a consequence, the effects of the drug solely; if so (and I do not see what other conclusion we can arrive at), how comes it that green stools are produced when the drug has not been administered? How comes it that when in health calomel does not produce green stools? This is almost invariably the case, though now and then exceptions do occur; but they are not frequent; but still, I do not for one moment concur with the above-established and received opinion. Plato, the philosopher, asserts that opinion is "a medium between knowledge and ignorance," and as this aphorism is incontrovertible, we must bow with due submission to the learned Greek's definition, and accept it; and as a deduction we may say that "every opinion is more or less well grounded, and evident as it approaches to one or the other of those two extremes." Now, to affirm that calomel alone produces green stools is not "knowledge," but "ignorance;" therefore, as the received opinion tends rather to the latter than to the former, we must (notwithstanding the long undisputed sway which this error has exercised over the profession) come to the conclusion that it is accordingly a paralogy based upon the want of careful observation.

(To be continued.)

THE HISTORY OF A DISPENSARY DOCTOR.

[WRITTEN BY HIMSELF.]

Preface to Chapter III.

CHARLES DICKENS, in the preface to his admirable novel "Nicholas Nickleby," says that after having drawn the character of Squeers, he was not only threatened with action for libel, but also put in bodily fear of corporeal punishment, by several Yorkshire schoolmasters, who were so like the original that they believed themselves to be intended to be Squeers himself. I, indeed, believed the character of Mr. O'Rorke to be unique: since the publication of the first chapter of "The History of a Dispensary Doctor," I have received several communications from different parts of Ireland, thanking me in a flattering way for having shown up that class of practitioner. As they are more numerous than I supposed, I not being what is generally termed a strong man, and besides in wholesome dread of an unmerited castigation, beg that such practitioners as may think themselves the original, will spare themselves the expense of buying a stick, as also, if they happen to live at a distance, that of train-fare. If their

Digitized by Google

spirits are ruffled, let them take a soothing draught, compose their minds, and make promise that towards their medical brethren they will henceforth (to use Jack Falstaff's words, altered for the occasion) "Eschew unprofessional conduct, live with clean hands, and as a doctor should." If there be any practitioner alive who takes the character uponhimself, I beg to tell him he is mistaken. The original of Mr. O'Rorke, as I stated in a foot-note, is now dead some years. As there is some discrepancy between the dedication and foot-note, I may state that the first chapter of "The History of a Dispensary Doctor" was written several years ago, but thrown aside under the belief that it was not worth publishing. To show the value of the scriptural teaching of doing good for evil, I may add that Mr. Jerry O'Rorke afterwards became my very good friend, I having been called in to see a case with him, where he nearly passed a silver catheter through a man's perineum in his efforts to pass a catheter per urethra, from the effects of which the man died; I tried at that time to shield him in every way I could. I must say that his conscience smote him, and he ever afterwards acted towards me as well as could be expected. To those entering on the medical profession I give this advice, that no matter how another practitioner acts *towards them*, let them always act professionally, and remember that under no circumstances ought they to forget that they are gentlemen, *because others do so*. Let practitioners refuse to meet such of their professional brethren as act unbecomingly, but let them not bring more opprobrium on the profession by copying their "*tricks of trade*." One word more, and I resume my tale: When "the Dispensary Doctor" was commenced, it was intended *exclusively* for professional readers; I was therefore surprised to hear several lay persons ask me whether all doctors were as bad as that? I would therefore remind my medical readers, especially those of the student class, who are apt to be thoughtless, that medical papers are intended for medical readers, not for sending home to their lay friends, where they will perhaps be read by young girls, whose *morale* will not be improved by a "full, true, and particular account" of a labour case.

Chapter III.

Doctor Scalpel does duty at a neighbouring dispensary, and gives a specimen of the minutes of one of their meetings, says somwhat on registration, is hastily summoned to visit a poor patient, and meets Father O'Reilly, who entertains him with amusing stories of the Irish peasantry.

The dispensary doctor of a neighbouring dispensary being slightly indisposed, asked me to take dispensary duty for a day for him, to which, I of course, readily consented. I am not going to give over again an account of a dispensary day, but think it worth while giving my readers a specimen of the copy of minutes. The spelling is unique, and well illustrates the class of men who are sometimes placed as masters over gentlemen of refinement and education. Here it is—

"It is resolve,—that John B. Wagstaff be chareman; Arthur Golding, voice-chareman; and Heugin Hegarty, onary sectary; carried hueanimously. Sined, Tom Moris, chareman of comite."

As I had not much to do, as may be seen from my taking the trouble to copy the above, I amused myself listening to some country people, who were registering births and deaths. The deputy was, of course, acting. He thought a great deal of his office, and his list of pains and penalties—in case the child was not brought to be cut with the pock within the prescribed time—something terrific to listen to. To his query, Where did the woman die? (of course, meaning what townland) the fellow, a wild mountaineer, scratched his head for a moment and then roared out "Where did she die? Begorra, where would she die, 'but in her bed.'" An old midwife also being asked where a child was born, "to whom she had done a good turn," as she said herself, promptly replied, "on the flure." The people hardly ever gave the date of the month; "next Monday will be three weeks," or "just before Corpus Christi," or "during the second trenching," was generally the nearest answers that could be got. One little old fellow came to register a child's birth, when, on being told that the Registrar-General would object if he saw a man's name signed to the registry who was neither occupier or father, said "Bedad," "then he can't get anybody else, for sorra one was in the donkey cart when t'was born, but meself, and herself" (an Irish country man always has *ego et meus rex* in his mind's eye). However, he failed to satisfy the deputy, as he could give no nearer date than the day "Pat Moragan's mare got the gripes;" so was put back for further information. A farmer, having registered his child, went out, when the deputy told me a rather amusing story of his having, at one time, lost an election for a doctor, in his district. There were two candidates, and the voting was very nearly equal. The farmer's next door neighbour intended to support the opposite candidate, and as he (farmer) knew that one vote would turn the election, one way or the other, asked his neighbour in, the night before the election, to have a glass, to show there was no ill-feeling on account of their taking opposite sides of the question. The other unsuspectingly went, the farmer trusting to his well-known abilities in drinking. However, his neighbour was too much for him, and he dropped under the table first, the other managing to stagger as far as the committee-room, gave his vote for *his* friend, and gained the election. Having returned home, I was just sitting down to lunch, when a man came running to my door with a red ticket, saying that a man was very ill a good way off, and begging I would make no delay. I hurriedly got the trap, and started at a good round pace, when I overtook my friend, the priest, who asked me to give him a seat on my car, as his own horse was somewhat knocked up from the stations. "That's a nice nag you have got now, Father Pat," said I, as we drove on. "O sir! then bad 'cess to him," cried he, "I wish I had never seen the horrid beast." "Why what ails the animal?" asked I. "He looks to be quite sound, and a beautiful goer." "I must part with him for all that," said he, "or he'll ruin my character." "Ruin your character; how so?" I asked, and in wonder. "Well, then, I'll tell you," answered my friend; "he stops at every public-house he sees. How he came to learn it I don't know, but if even he is at the other side of the street and sees, 'So-and-so, licensed to sell Porter with Spirits,' over he goes to spite me, and stops dead at the door. "Have you had him long, Father Pat?" said I, with a sly look. "No," said he, laughing, "only a week; but, please the Fates, he'll ruin somebody else's character now, as I intend selling him at Coleraine in a fortnight. The truth is," added he, in explanation, "I bought him from a man that would drink a river dry. Faith, he never went into a town without drawing it." "What is that?" asked I. "Well," said Father Pat, "drawing a town means beginning at the first public-house—say on the left-hand side of the street—and going into every one of them until you reach the last one at the right-hand side." We chatted as we went on concerning the uncertain tenure a dispensary doctor has of his position. "Well, that's the case often, surely," added the priest; "but it is often the doctor's own fault. I am sorry to say some of your brethren take too much; that makes them quarrelsome and lazy, and then they are sick in the morning and can't do their business properly. Not but there are some fellows whom I call doctor hunters. When I was stationed at Ballydrum, the dispensary doctor there had incurred the odium of a red-ticket giver—a warden, I believe he was. One of this man's labourers got sick, or fancied himself ill; he went to bed and sent for Dr. Moriarty. When the Doctor came he found he had a large family, and, stretching a point, gave him some out-door relief. In a couple of days the warden came to the sick man, and said, 'Jack, it will do you good to sit in the sun. I can't "fence" the field next to your house; I'll give you a couple of shillings to sit at the gap and prevent the cows going out.' When the warden saw him seated there,

Digitized by Google

away he went for the relieving officer. 'There's a man, now, said he, 'whom the doctor is giving out-door relief to.' I can assure you," added the priest, "it required all the influence that could be brought to bear on the matter to prevent the doctor's dismissal. I often find," said the priest, "that the worse doctor hunters are men of low birth, who have raised themselves to good positions, and amassed money; these men often think that everybody else must have as high an opinion of them as they have of themselves. On account of their wealth, and the fact of their, perhaps, forming part of his committee, they think the doctor ought to be like Uriah Heep, 'very 'umble.' If the doctor is an independent kind of man, and well-born, he, of course, thinks himself just as good as any *novus homo;* when the doctor means to treat such a man as an equal, the other makes it out pride, and thinks the doctor looks down on him on account of his humble origin. Hence, whatever the doctor says or does with regard to such a man, is misconstrued, and secret dislike often soon ripens into open hostility." We now neared the house, and a countryman told me to hurry as the man was nearly dead. Quickly walking up to the hut, a miserable one-roomed cabin, with the usual accompaniment of a cess-pool, we thrust in the door, when a scene met our gaze which I shall never forget. Stretched on a wretched bed of straw, and only partly covered by an old patchwork quilt, lay a man who must have been a very fine specimen of the human race when well. He was worn to skin and bone by chronic phthisis, his ghastly face and quickly glazing eyes were rendered more awful still by the dim light of a dip candle, which was held in his already relaxing fingers, by a rosy little curly-haired child, who looked with wonder at a scene she did not comprehend. The mother on her knees, rocking herself to-and-fro, in speechless agony, and six or seven older children looked on in silent fear, at the advent of that grim enemy, which they saw for the first time. With one groan he fell back dead, while a cry which, as I write, is ringing in my ears, escaped her, whose only support was thus taken away. As she fell down in a faint, a deep feeling of stillness so indescribable, yet which I am sure every-one who has seen a man die has felt, stole over us, and we silently left; a deep sigh escaping from the good priest, as I heard him mutter, "Thank God, I prepared him the last time I was here. Ah, Doctor," said he, "if half the world saw the sad sights doctors and priests see, less money would be spent on the savages of Gullamagoo, and more on poor people, such as these."

(To be continued.)

Translations.

M. CHARCOT ON LARYNGEAL VERTIGO.

Translated from *Le Progrès Medical*.

UNDER the name of *laryngeal vertigo* (*vertige laryngé*) Dr. J. R. Gasquet has published (*Practitioner*, August, 1878) the history of a case, an analysis of which has been recently given by Dr. G. Decaisne in the *Revue des Sciences Médicales* (No. 26, 15th April, 1879, t. xiii., vol. ii.) The case was that of an admiral on half-pay, who had always led an active life, and who had until the last few years, enjoyed remarkably good health. Three years ago at the age of 70, he had a severe attack of bronchitis, with spasmodic cough and fits of dyspnœa, which returned several times during the day. From this period he became subject to a complaint of which he gives the following description:—

He suddenly loses consciousness, and falls to the ground. In two or three minutes he comes to himself, but feels giddy for some time afterwards. The attack is limited to these phenomena, there being no convulsions or any other symptom. This patient was successively treated for cerebral disease, [illegible], dyspeptic vertigo, &c., but without success. After [illegible] he remarked that the attacks, which returned at very [illegible] intervals, *were always preceded by an irritation of the larynx* and by a *spasmodic cough*, which, however, was not invariably followed by a fit. Serious attention was then given to the affection of his larynx, and when that was cured the attacks disappeared, and have not returned for nine months.

M. G. Decaisne very justly connects this interesting observation with cases which M. Charcot has made the subject of a communication to the *Société de Biologie*, in November, 1876, under the same appellation—*laryngeal vertigo*—employed by Dr. Gasquet. The analogy which exists between these cases is very striking. It will be therefore worth while to recapitulate from the account given in the *Gazette Médicale*, Paris, 1876, No. 49, p. 588, the chief facts communicated by M. Charcot to the Society above mentioned, together with the remarks which he made in connection with them:

M. Charcot was called about fifteen years ago to see a patient who was subject to attacks of gout, and also occasionally suffered from spasmodic fits of coughing. One day during one of these fits he saw him suddenly fall down, but as quickly recover himself, without presenting any trace of convulsions. The patient, who, on recovery from this attack, was confident that he had not lost all consciousness, stated that he had occasionally suffered from these fits ever since the commencement of the spasmodic cough. It is unnecessary to add that, although now 55 years of age, he has never been subject to epilepsy. Again, in August, 1876, M. Charcot saw in consultation with Dr. Caresme, M. H., æt. 55, who complained of being subject for the last twelve months to what he called his "attacks." These are announced by a tickling sensation a little below the larynx, accompanied by a dry cough. All at once the patient loses consciousness and falls down; his face has a turgid and bluish appearance; and sometimes there are some convulsive twitchings in the face, and in one of the arms. But he neither bites his tongue nor passes his urine involuntarily. The fit is of very short duration, and is scarcely over before M. H. completely recovers himself, without any feeling of stupefaction, so that he is able to resume the conversation from the moment when it was broken off. For some time the attacks have been very frequent, as many as fifteen in the course of the day, and once the patient has fallen down in the street. The fits are always preceded by the laryngeal irritation and cough; but sometimes the paroxysms of cough are not followed by any attack. In the latter case the patient only experiences a feeling of vertigo which he is scarcely able to describe. For a long time M. H. has been subject to bronchitis and emphysema, but it is only for the last twelve months that he has suffered from the tickling sensation above mentioned, spasmodic cough, &c.

M. Charcot is inclined to think that in cases of this kind the origin of the attack is to be attributed to a particular irritation of the centripetal laryngeal nerves. In that case the affection would consist in a kind of *laryngeal vertigo* comparable, in certain respects, with the *vertigo of Ménière*, which appears to him to be connected with an affection of the nerves of the labyrinth. Under this impression he prescribed cauterisation of the pharynx with nitrate of silver, irritant applications to the front of the neck, and internally large doses of bromide of potassium. Either by these means or through some other cause the patient recovered after he had been under treatment for a few months.

Since the above observations were made, M. Charcot has had the opportunity of noticing some facts which present the same mechanical type. Quite recently, while inquiring into the literature of the subject he came across in the *Berliner Klin. Wochenschrift*, 26th Sept., 1876, p. 563, an observation made by Dr. Sommerbrodt, on a man, æt. 54, who had been subject for the last twelve months to epileptiform attacks, accompanied by laryngeal symptoms. The presence of a polypus in the larynx was detected, after the removal of which the attacks completely disappeared.

In the last clinical conference held at La Hospice de la Salpêtrière, December, 1878, M. Charcot again called attention to this complicated group of symptoms, to which he proposed to give the name of *vertige laryngé*. He laid great stress upon two cases which had recently come under his notice, and which, as the following account will show, evidently belong to the class of affections under consideration.

"Dr. W., a Russian by birth, about 40 years of age, was twelve years ago plunged during the winter time up to his middle in water for nearly an hour, in consequence of which he contracted an attack of general articular rheumatism, which confined him to his bed for nearly three months. Soon afterwards a bronchitic affection showed itself, which gradually passed from an acute into a chronic form. A constant

Digitized by Google

feeling of oppression, sibilant rhonchi, which could be heard at a distance from the chest, and difficult expectoration, were the chief symptoms complained of. Frequently, too, there were violent attacks of asthma, which generally ended in the expectoration of soft, vermiform pieces of phlegm. In the course of the year 1877, the special symptoms about to be described occurred on ten different occasions. Apart from the attacks of asthma, and without any appreciable cause, the patient suddenly experienced a little below the larynx in the course of the trachea, a peculiar and painful sensation of burning and tickling, followed by a fit of coughing. Immediately afterwards a feeling of giddiness comes on, during which Dr. W. feels the fingers of his left hand involuntarily flexed, his left arm stiffly extended, elevated up to a level with his head, and agitated throughout by three or four convulsive movements. At this moment he loses all consciousness, and on his recovery, which takes place in the course of a few seconds, he finds himself lying on the ground, and on his left side. The limbs of that side do not in the intervals of these attacks appear disordered, with respect either to their power of motion or their sensibility. On several occasions the burning sensation, the tickling in the throat, and the premonitory cough have been followed by a few sibilant inspirations, and a threatening of suffocation only, the attack thus being incomplete. A laryngoscopic examination made by M. Fauvel did not discover anything abnormal beyond a little redness of the mucous membrane. Dr. W. died very suddenly, in the full possession of his senses, and without any sign of convulsions, during on attack of asthma, on the 12th January, 1878.

"M. G., æt. 45, had on the 20th July, 1878, an attack of bronchitis, which left behind it a permanent feeling of heat and a tickling sensation in the region of the larynx. These sensations were aggravated at times, and were followed by very distressing fits of coughing. In the month of August M. G. was suddenly awakened by one of these fits. He immediately got out of bed, lost all consciousness, and when he came to himself, a few minutes afterwards, found that he was lying on the floor. Since that time the attacks have occurred frequently; sometimes as many as three and four in the day. On every occasion he loses consciousness and falls to the ground; and several times he has fallen in the street. He recovers himself, however, almost immediately, without any marked disturbance of his ideas, but he has no recollection of anything that has passed during the attack. He only remembers the tickling in the larynx, the cough and the vertigo, which preceded the fits. According to the descriptions of those who have seen him in these attacks, his face sometimes assumes just before falling a bluish and turgid appearance; occasionally there are convulsive movements of the face and the extremities, but no premonitory cry, and no involuntary emission of the urine. He does not, moreover, bite his tongue, nor is there, on his recovery, any nausea or vomiting. A laryngoscopic examination made by Dr. Krishaber did not lead to the discovery of any lesion either in the larynx or trachea. Such was the situation of M. G. when he came under the observation of M. Charcot, in December, 1878. This physician prescribed bromide of potassium in large doses, and flying blisters to the regions of the larynx; and after three months of this treatment the attacks completely disappeared."

The reader will have noticed in what relationship the above facts stand to each other. The phenomena which justify the appellation of "vertigo" being given to them, have been constantly accompanied by other phenomena to which the qualification "laryngeal" may be legitimately applied. In fact the sensation of tickling and of heat, which, along with the cough, proceed apparently from the larynx, have in all cases preceded the fall of the patient, and his loss of consciousness. The latter symptom seems to be a constant characteristic of what may be called the "great attacks" (*grandes attaques*); it is only wanting in the less severe cases, and where the attacks are incomplete. In the great attacks the existence of some convulsive phenomena, localised in the face or in one or more of the extremities, appear to be a frequent complication. In one case the convulsive symptoms assumed the form of a partial attack of epilepsy (case of Dr. W.) and the patient could observe, in some measure, the development of the first phases of the attack. The loss of consciousness follows quickly after the appearance of the *aura laryngea;* it is of short duration; a few seconds or minutes after the fall the patient regains his senses, and he gets up, very little confusion in his ideas being noticeable, and such as there is being rapidly dissipated. The end of the attack is not marked, as in the case of labyrinthine vertigo, by nausea and vomiting; and during the attack there is not, to the best of our knowledge, any biting of the tongue (*a*), or involuntary discharge of urine, as is so frequently the case in epilepsy.

Such are the more important facts that have as yet been observed with regard to the symptomatology of laryngeal vertigo. Without wishing to forecast the future, we may even now affirm that the symptoms grouped under this appellation constitute a clinically distinct form of disease, and that it will hereafter be possible by certain characteristic features to practically separate them from those that are allied to it. Thus, to cite but one example, the vertigo *ab aure læsa*, is generally announced by a brusque exaggeration of certain auditory sensations, such as those of humming, hissing, &c. The patient does not lose consciousness when he falls, and he is able to relate what has happened to him as well as if he had been suddenly pushed down by the hand of a stranger. Usually he falls directly forwards upon his face, more rarely on his back or on his side (*b*); and the end of the attack is more often followed by nausea and vomiting. We may add, moreover, that its somewhat necessary subordination to the laryngeal symptoms should distinguish the form of vertigo under consideration from the different forms of the epileptic *petit mal*, to which it otherwise bears no slight resemblance.

According to the foregoing observations laryngeal vertigo appears to be more or less directly consequent upon laryngo-bronchial affections, developed under the influence of local causes, or depending upon a peculiar diathesis, such as gout and rheumatism. But it is not always so. The observation of Dr. Sommerbrodt shows that analogous phenomena may arise from the presence of a polypus in the larynx; while, on the other hand, M. Charcot has also demonstrated the fact that all the symptoms which he attributes to laryngeal vertigo, may be observed in patients suffering from *locomotor ataxy*, or that this may constitute one of the varieties of those *crises laryngées tabétiques*, of which Dr. Féréol was the first to give a description (*c*).

In conclusion, we must state that at present "laryngeal vertigo" can only be considered as a group of symptoms, the pathogenic theory of which must be reserved for a future time. Undoubtedly the premonitory symptoms of the attack seem to show that the larynx or upper part of the trachea is the starting point of all the phenomena above described. We might, moreover, get some information from experimental observation, especially that which has been made on the effects of exciting in the lower animals, the superior laryngeal nerve (*d*), but in our opinion we should still be unable to find by that means full explanation of the phenomena under consideration.

Whatever the nature of the affection may be, revulsive applications to the region of the larynx, cauterisation of the pharynx, and the administration of large doses of bromide of potassium, appear to have cured the complaint in every case in which they were tried, those arising from the presence of a polypus excepted.

(*a*) In Dr. Sommerbrodt's case it is stated that the patient often bit his tongue.

Special.

STRIPLING RECRUITS.

THE material of which an army is composed, and the physical capacity of the recruit enlisted for the practice of war, should, without doubt, be regarded as objects of high national concern. In England it has been the uniform rule of those upon whom the duty has devolved, to offer sound advice in the matter of recruiting, to insist upon a due attention being given to the physical qualifications of the recruit, and the proper age at which he should be enlisted, otherwise it would be hopeless to look for effi-

Digitized by Google

ciency and a fair amount of exemption from disease. Successive Directors-General have always endeavoured to place these facts prominently before the War Office, but it would almost appear, without having made a lasting impression upon those in authority. That this is so, will be gathered from "a War Office Return," moved for in May last by Lord Straithnairn, and just now issued. From this document we learn that the War Office has continually received complaints from commanding officers "of the extreme youth and physical incapacity of the troops under their command;" but, which we presume, have not received much attention, and the consequence is that, as in South Africa, we are continually hearing of some sad breakdown.

If the authorities at the War Office have no confidence in the medical department of the army, they should visit the museum at Netley, and there see in hundreds of prepared specimens the evil consequences of a vicious and costly system of trying to make soldiers out of stripling recruits.

It is perfectly hopeless to expect striplings, long before growth is completed, and cartilage is consolidated into bone, to be physically equal to duties of barrack life, let alone that of a foreign climate and field of war. It has been most emphatically shown by military surgeons, "that stripling soldiers fill the hospitals and not the ranks." "I must give it," says Sir James McGrigor, "as my opinion, formed upon observation and experience, that it is very prejudicial to the efficiency of the service to admit lads, or very young men; for these are not only quite unequal to the fatigues of war, but their constitutions not being as yet firmly established, they are almost certain to suffer greatly from change of climate, and to become sickly even in the ordinary course of service." In Continental armies, in which troops have been hitherto almost exclusively employed in their native climate, strong objections have been urged to young recruits. It was said in derision of the Prince of Condé's army, that it would be "a fine army when it came of age." A similar sarcasm would not be entirely out of place with regard to our own army, for by the common consent of those in command, we find that the recruits enlisted are, for the most part, unfit for the duties of peace or war.

Sir Thomas Steele, K.C.B., reports: "There is no disguising the fact that a great many of our soldiers are too young to stand the hardships of active service," and he quotes the reports of the medical officers respecting the march on the return to Aldershot from Windsor, wherein they say that "the strain on the young soldiers had been so great that a large proportion of them would have succumbed had their exertions been prolonged." Lord Chelmsford reports from Aldershot at the end of 1877, before he left England for Africa, that, "with young soldiers and young non-commissioned officers forming the large proportion of the strength of a regiment the difficulties of command are very much increased." Sir J. Garvock, G.C.B., reports "That there was much more insubordination than formerly, and this he says is due to the fact that, whereas, when he entered the service the recruit, on joining, finds himself amongst comrades whose habits of discipline were fully formed; now, on the contrary, he is surrounded by untrained and unruly boys." General Sir C. Van Straubenzee reports from Malta "that the recruits were too slight and too young, and that they would be certain to give in after a short period of rough work and exposure." Lieut.-General Lord A. Russell reports from Dover, "that crime had increased owing partly to the want of experience, and non-commissioned officers, but more particularly to the large proportion of mere boys who have no idea of discipline, and are quite unequal to the hard work of soldiering." These views are shared in by every officer of experience, and who, one and all, condemn in the severest terms the present method of recruiting the army. To persist in such a course is to court disaster whenever and wherever our troops may be sent to operate. It is to be expected, however, that this return will open the eyes of the War Office to the fact that, by continuing to enlist boys and sending them out to fill up the ranks, they will but encumber the hospitals and the roadsides.

TRUE HUMANITARIAN WORK FOR ANTI-VIVISECTIONISTS.

Persons with leisure and energy which they do not care to expend in idle talk upon vivisection cruelties and the teachings of science, things about which they generally display a lamentable amount of ignorance, will do well to follow the good example of a truly humane lady, Mrs. Burton, who we see has been most successful in her endeavours to lessen the every-day cruelties practised upon our "poor relations."

This English lady, who for some time past has resided at Trieste, by her own efforts, and with a true womanly earnestness in a good cause, has succeeded in bringing about a great change for the better in the treatment of dumb animals. This has been effected, not by putting the law in force against offenders, but by kind words and the distribution of rewards amongst those who evince a desire to be kind to the brute creation.

The moral effect was seen in the crowds of bright faces and the clean holiday dress of those who came to wintess the distribution of the prizes and diplomas to the successful candidates, and which took place in the Town Hall, "Il Ridotta" before the Mayor, municipality, and the rest of the great people of Trieste. The sum distributed amounted to 1,125 florins; and this was given away in prizes ranging from ten to thirty florins. The band of a regiment stationed in the town contributed to the pleasure of the day, and as each man and woman, for there were several of the latter, walked up to receive his or her prize, gave a great flourish of trumpets. The list of prize-takers was a tolerably long one, and comprised fifteen cabmen, seven tram and omnibus men, six drivers of long trucks with two horses, called *carodori*, two with one horse, seven with two oxen, and five with one ox. Then came three drivers of pony carriages, four mule drivers, three vendors of fowls, three slaughter-house men, two farriers, nine policemen, and three candidates for humane inventions, one of which was for the transport of live fowls, and two for a less barbarous means of catching stray dogs than the lasso. Two of the prizemen were received with greater applause than the rest—one, a cripple, crawling along the ground by means of two bits of wood. We have seen the same kind of cripple in our London streets. This was a respectable looking lad with a kindly face. He appeared to "swarm up" the horse, there is really no other way of expressing his mode of getting to his work; and he grooms him so kindly and tenderly, and never avenges himself, as a bad disposed boy would, on the beast for his own natural misfortune. The other was also a cripple, who always fed his horse before himself, and when he only earned enough for one he gave it to the animal, because, as he says, "the horse earns a living for both."

At the conclusion of the distribution Mrs. Burton addressed the assembled multitude in words replete with good sense and generous sympathies. She thanked the drivers of public vehicles generally for showing a desire to treat their horses with more kindness than heretofore; but she added, "I am not yet satisfied. I must have a great improvement made in night cabs, for all the worn out horses are sent out at night, and drivers lash them cruelly when public opinion is asleep. And then as to the slaughter-houses, the only places in Trieste that are safe from any intrusion, a good deal of cruelty takes place. I want to know if it is not possible to prevent men from using oaths and being brutal. Just imagine! we have had cases of goughing out horses' eyes, beating an ox to death, and cutting up a cat alive. Then there is the cruelty practised by those who send poultry to market, as well as a host of others, less excusable and of

Digitized by Google

a very shocking nature, but which require to be sternly suppressed."

There is, indeed, as Mrs. Burton very truly said, a wide field of usefulness open, and in a thoroughly good cause for those who earnestly desire to see physical suffering lessened, whether the result of wantonness, carelessness, or other cause, and which we see hourly and daily going on around us and inflicted upon dumb animals, enslaved by us and worked to death for our comfort and pleasure. Or even more often, and in a less inseparable way, perhaps, wound, lacerate, torture, and mutilate, for the gratification of the palate; or worse still hunt and tear to death for the amusement of killing in sport. Yes! Let those who now wilfully waste much time and money in an ignorant and ungenerous endeavour to stop the progress of science turn their attention to the amelioration of the numberless kinds of cruelties practised by thousands of thoughtless and vicious people both in town and country, and try to do something towards humanising, moulding, and elevating men and women to that higher level marked out for us by the Great Founder of our Faith.

Copy of Circular Letter to Surgeons of County Infirmaries acting as Medical Officers of Gaols.

General Prisons Board, Dublin Castle,
8th July, 1879.

SIR,—Adverting to the circular of the 3rd of May, addressed to you and other surgeons of county infirmaries acting as medical officers of gaols, I am to inform you that the Board are advised that the said officers may be regarded as prison officers within the terms of the 27th section of the General Prisons (Ireland) Act, 1877.

I have further to acquaint you that the Lords Commissioners of Her Majesty's Treasury have sanctioned the following arrangement as regards the remuneration of the medical officers of gaols appointed previous to the passing of the Act of 1877, viz., that they should have the option of undertaking the duties of compounding medicines in addition to their duties of medical officer, and to be paid according to a general scale approved by the Treasury, or in the event of any such medical officers being unwilling to undertake the duty of compounding medicines, that the salary of any such officer should be individually considered according to the circumstances of the case.

Under the foregoing arrangement, if you are prepared to undertake the duty of compounding medicines in addition to your duty as medical officer, you will be entitled to a salary of £....., and I shall feel obliged by your informing me whether you are willing to accept these terms and conditions, or if you prefer to continue to discharge the office as at present, *i.e.*, without being required to compound medicines, at such salary as may be hereafter fixed by the Treasury.

I am, &c.,
(Signed) JOHN BARLOW, Vice-Chairman.

The foregoing return and its letter is but a piece with the meanness already displayed by the petty autocrats of the Irish Prisons Board, who, after a futile attempt to force upon the prison surgeons duties which they well knew those officers had no right to discharge, now seek by threats to force those officers to abandon their rights, and perform these duties.

The letter of Mr. Charles Bourke (for it is his, and not the chairman's) is capable of only one interpretation. It says plainly to the Prison Surgeons—"We know that it is not your duty to dispense medicines unless you are properly paid for that duty, and we don't intend to pay you properly; but if you refuse to do what we order you—rightly or wrongly, we will cut your salary down to a pittance." The Prisons Board offers a number of the surgeons £40 a-year for the largely increased duties imposed upon them by the new Act, if they consent to compound the medicines, for which duty alone the salary would be barely adequate, and it attempts to force them to accept such a sum by threatening to make it less, or nothing if it be refused. Such a policy is worthy of a Connaught board of guardians, but hardly reputable in a public department; and we are quite confident that, if the surgeons who have been so insulted elect to fling back the £40 at Mr. Bourke's feet, they will receive at the hands of Parliament and Government something more nearly approaching to justice than the Prisons Board offers.

Department of Lunacy.

CONDITION OF LUNACY IN ENGLAND.

THE Report of the Commissioners in Lunacy, to which we have alluded in a previous number, is one of the best issued for many a year. It not only contains the usually dry statistical tables, with the changes that have taken place in the County Asylum Hospitals and other institutions for the insanh, but is replete with valuable remarks on certain matters of general interest, which have been made subjects for discussion during the year. We allude to private asylums in particular. At the beginning of the year there were registered on the commissioners' books 69,885 persons of unsound mind, distributed in the various institutions for their reception. Of this number by far the largest number was in county and borough asylums, and

Digitized by Google

2,476 persons were confined in metropolitan licensed houses, and 2,169 in provincial. There were also 202 Chancery lunatics, but which are not included in the general statistical list. By comparing the number of persons of unsound mind during the last ten years, we find that in 1869 there were 36,762 lunatics out of a population of 19,686,701; whereas at the present time there are 69,885 out of a population of 25,165,336, showing a gradual and progressive increase of lunacy during this period. Of the tabulated causes for lunacy we find intemperance at the top of the stated causes. It will be an interesting fact to compare the causes of insanity this year with next, as the Habitual Drunkard's Act will come into force at the commencement of the year, and will doubtless help to prevent intemperance from exerting its fearful ravages to the extent it has been doing at the present time. The total number of patients admitted into the various asylums and hospitals for the insane during the past year was 6,666 males and 6,643 females, making in all 13,309, out of which the cause of the insanity could not be determined in 3,035 of the cases. This is very unsatisfactory. It frequently happens that the friends are loath to assign an attributable cause for the lunacy, especially when there is any hereditary predisposition to mental disorder. As far as our experience goes, we are of opinion that in every case of insanity a distinct cause can always be traced; it is therefore surprising that in such a large proportion of cases the cause should remain undetermined. It is also to be regretted that out of 4,715 patients who died, post-mortem examinations were only made in 2,349 instances. In the existing ignorance of our knowledge of mental pathology and the localisation of brain lesions, we think that post-mortem examinations should be made in all cases dying in asylums or hospitals for the insane. We regret to have to announce an unusual number of suicides in asylums. This appears to us to be the result, in many instances of the non-use of restraint. The Report contains lengthened accounts of the various county asylums and hospitals, and enters minutely into minor details. With regard to the remarks on private asylums, as well as on other matters in connection with the Report, we must leave for another article.

THE Secretary of St. Mark's Hospital for Fistula, was arrested last week, and charged before the Lord Mayor of London for forgery. Cases were proved against him of misappropriating the funds of the charity by these means, and he was committed for trial.

IN the principal foreign cities the rates of mortality, according to the most recent weekly returns, were—In Calcutta 22, Bombay 29, Madras 31; Paris 24; Brussels 28; Amsterdam 20, Rotterdam 17; The Hague 22; Copenhagen 23; Stockholm 21; Christiania 23; St. Petersburgh 32; Berlin 33, Hamburg 27, Dresden 29, Breslau 33, Munich 37, Vienna 23, Buda-Pesth 34; Rome 27; Naples 31, Turin 27; Alexandria 47; New York 28; Brooklyn 24, Philadelphia 20, and Baltimore 20 per 1,000 of the population. Small-pox caused 22 deaths in Paris.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, SEPTEMBER 17, 1879.

RECENT REPORTS ON CERTAIN OUTBREAKS OF DIPHTHERIA AND ENTERIC FEVER.

ALTHOUGH the prevalence of enteric fever is unquestionably, and of diphtheria, possibly owing to defective drainage and other causes of sewage contaminations, two or three Reports sent in to the Local Government Board show how difficult it is in some cases to trace those diseases to their proper origin.

As regards diphtheria, Dr. Cory's investigations into the origin of an outbreak in Cranfield and other villages of the Ampthill District, were not attended with much success. Certainly, the sanitary arrangements of the villages inspected were anything but satisfactory. The villages are all on the Oxford clay; the rain as it falls remains long in the ditches and pools, the latter being numerous, and called *moats*. These moats are in many cases contaminated by the leakage from badly-constructed cesspits, some receiving the small drains conveying the slops from the houses. Pigsties also abound and add their share to the contents of the moats. Drainage, answering any sanitary purpose, there was none. It was found, too, that at Lower Shelton a case of diphtheria had broken out in a house which was in juxtaposition to a moat, which, in rainy seasons, receives the floating contents of a cesspool about five yards distant, the cesspool and the moat at such times being one water; while all the earlier cases at Cranfield occurred at the south-east of the village, where there is a ditch much polluted by the drainage from cesspits and pigsties. Still, as regards the "origin and spread of this out-

Digitized by Google

break," Dr. Cory reports that "the long interval that had elapsed since the occurrence of the first cases at Cranfield, and the constant communication held between that village and Bedford, where this disease has been prevalent for the last two years, have thrown great difficulties in the way of this important part of the inquiry, and have rendered any exact account impossible." It would seem, in fact, as though sewage contaminations act more as a nidus or medium by which the germs of diphtheria are developed or spread, than as, *per se*, the essential cause of the disease. For "as regards the influence of insanitary conditions," Dr. Cory very justly remarks that "the sanitary conditions, bad as they were at the time of the outbreak, both in the parishes of Cranfield and Marston, yet were not so bad, I am informed, as they have been previously; nevertheless, no deaths had been registered in either parish from diphtheria since the 18th March, 1872, until the present outbreak." This fact is not only true of many outbreaks of diphtheria, but also of the origin and propagation of many other infectious diseases, such for instance as small-pox. And, hence we hear people exclaiming before the sanitary inspector, and not without some show of reason, "I don't believe that the drainage (or the water) has anything to do with it, for here we have lived for years, drinking the same water and smelling the same stinks, and yet have never suffered from such a fever before!" we, however, know well that bad drainage has a good deal "to do with it," although, perhaps, sanitarians often overlook the probability of there being, in many cases, some other factor at work besides that of bad drainage, and of filth in all its Protean shapes. Nor was Dr. Cory able to discover any causal connection between this outbreak and school attendance, or the milk supply, or diseases of animals. One instance to which he refers shows how difficult it is sometimes to trace the origin of an isolated case of diphtheria. Hearing that two fresh cases had occurred after his departure, he returned and found that one of these was at Broad Green, a detached portion of the village of Cranfield, which had not suffered hitherto from the disease. A house-to-house inspection showed that, out of a population of 124, not a single case of throat illness existed among them, except the one reported. The case was that of a boy, æt. 5, who was taken ill on the 3rd of May, previous to which he had been quite well. He went to school at Cranfield on the 1st May. On the 30th April he went into Bedford with his uncle, where he remained a short time, and partook of food with milk. The mother said that at home he never had milk, or very rarely so; and the water used for drinking purposes had been obtained from the rain-water-butt outside the house. Of course as the disease was prevalent at Bedford the boy might have contracted it at that place, but there is no evidence to show that the milk he drank was contaminated, or that he had been near any sewage emanations.

Turning now to Dr. Thorne Thorne's report of a recent outbreak of diphtheria in the parish of Wickford, in the Billericay Rural Sanitary District, Essex, we have fresh evidence of some causal connection between defective sewerage and diphtheria. The village of Wickford, says Dr. Thorne, is fortunate in having a wholesome water-supply, but the means of drainage are of the worst description. It was found that the first child attacked had been residing at a cottage which has within a few feet of it an offensive privy with pit, to the foul emanations from which were attributed two previous attacks of "sore-throat;" and Dr. Thorne draws the general conclusion "that the circumstances under which the disease arose and spread are precisely those which are so well known to be associated with the fatal spread of infectious and preventable diseases." But the fact that "the conditions of drainage and of excrement disposal in the village of Wickford have long been such as to call for remedy," coupled with the fact that a similar outbreak had not occurred in the village for some considerable time, suggest the question whether, as regards the origin of this particular outbreak, there was not some other factor at work besides that of bad drainage. That, speaking generally, the insanitary condition of the village has long been a prolific *fomenter*, if not actual source, of infectious disease, has been amply proved by the reports of the Registrar-General with regard to the high death-rate in this district and the frequent prevalence of fever and diarrhœa.

There is not so much difficulty in accounting for outbreaks of *enteric fever* as there is in tracing to their source attacks of diphtheria. In Dr. Airy's recent investigation into the causes of an outbreak of enteric fever in Chichester, he came to the conclusion that, although some cases might have arisen from the escape of poisonous air from the covered branch of a stream called the Levant, and which had been specifically polluted by a previous outbreak of typhoid fever; yet "the facts relating to special incidence of fever on customers of a particular dairy are such as could not be explained on the hypothesis that the outbreak was due, as a whole, to sewer-air or any other cause than infected milk." The actual mode in which the milk became infected was more questionable, but his inquiries led him to point out a possible cause of milk contamination to which, as far as we know, little attention has been hitherto directed. For, on going from the dairy to the meadows where the milkman's five cows were pasturing, he found that the water the milkman used for washing the udder of the cow he is about to milk was taken from the Levant stream. Having cleansed the udder and his own hands he rapidly wipes them with his apron and proceeds with his milking. In this way an extremely minute portion of contaminated water may become mixed with the milk in the can. "Whether so minute a quantity of the poison could so rapidly impart its poisonous properties to the milk as to cause enteric fever in so large a proportion of those who drank of it, is," says Dr. Airy, "a question which I must leave open." Nevertheless, the author of this report has done well to point out a hitherto unrecognised way in which milk straight from the cow may become contaminated with the contagium of typhoid fever. With regard to Dr. Blaxall's report upon an epidemic of enteric fever in the village of Selborne, Hants, all we need observe is, that the reporter came to the conclusion (1) that the introduction of the fever into Selborne was propably due to importation from an infected locality by a woman who was herself slightly affected with the disease; and (2) that the subsequent outbreak and spread of the disease might be regarded as the result of the foul privies and impure water-supplies

having become specifically contaminated by the evacuations passed by persons suffering from enteric fever.

Lastly, we cannot say that the investigations described in those reports lend any support to the "pythogenic" theory of the origin of typhoid fever. On the supposition that this fever may originate, *de novo*, in the drinking of water, or the breathing of air, contaminated by sewage emanations, it is difficult to understand how either Selborne or Chichester could ever be free from the disease. The latter city has the credit of being full of wells and full of cesspools, and the porous gravelly nature of the soil gives every facility for the soakage of filth from the cesspools into the wells. It is notorious that this often happens, much of the well-water being wholly unusable. And as regards Selborne, the village is said to be virtually unprovided with drainage, abounding in foul privies, and in wells whose water was contaminated by the drainage from the privies. In one place the extent of the soakage of the soil with sewage might be inferred from the fact that, on cleansing a school-privy after the lapse of eight or nine years, the contents were found to be dry, the liquid matters having leaked away.

IRISH SANITATION UNDER THE PUBLIC HEALTH ACT OF 1878.—II.

We expressed last week our great dissatisfaction at the view taken almost unanimously by Irish sanitary authorities of their responsibilities under the new Public Health Act, and our extreme disappointment that the Irish Local Government Board had encouraged the disposition of those authorities to render the Act a nullity, and to obstruct sanitation and cleanliness.

Recapitulating the proceedings of the Local Government Board for Ireland since the passing of the Act of 1874, we pointed out how that department, moved by the well-known hostility of its Vice-President, Sir Alfred Power, had persistently and energetically used its executive position to defeat the purpose for which the law was made, and to counteract the wishes of the Parliament which made it. We showed how, with that object the Local Government Board refused to permit sanitary authorities to pay their officers fair salaries—had refused to provide any supervision of the performance of their duties by those officers or by the authorities themselves—had deprived the "medical superintendent officer of health," who was constituted by the Act, of all influence by illegally naming him a "consulting" officer invested with no duties unless when "consulted" by the sanitary authority—had tried to break down the influence of the "medical officer of health" by, again illegally, naming him "sanitary officer," and, finally, had knowingly permitted the law, which it was their duty to enforce, to be laughed at and disregarded, and the sanitation of Ireland to remain unimproved. We did not enter upon this history for the purpose of discrediting the Irish Local Government Board—though it certainly has that effect—but to make it understood by the public, the policy which, we deeply regret to see, has outlived Sir Alfred Power's administration, and which has made itself manifest in the recent acts of the Board with respect to the Act of 1878.

We do no need to produce evidence of the purpose or the effect of that policy. Everyone who knows the Irish sanitary system, knows that its purpose was to shirk responsibility, to save the State funds, and to keep clear of a collision with the guardians and other patrons of dirt throughout the country, and that its effect has been to saddle the Irish ratepayers with an outlay of £14,000 a-year, for which hardly any value is received, and to bring the law and the commands of Parliament into open contempt and avowed disregard. We certainly hoped that, with the exit of Sir Alfred Power, and upon the direct instruction of a Select Committee of the House of Commons, the policy of the Board would undergo an alteration. We have been disappointed. At first the Board took the course of simply ignoring the new Act, and omitting to act upon it, or to inform either sanitary authorities or officers of the changes of the law, and of the new duties imposed on them. Then, being pressed to move, it positively refused to do so. Being coerced by legal opinion and Parliamentary pressure, it, at length, caved in, and issued its circular.

We extract a few paragraphs from that document.

Whereas by the eleventh section of the Act it is enacted that every medical officer of a dispensary district shall be a sanitary officer for such district, or for such part thereof as he shall personally be in charge of, under the title of medical officer of health, and that every sanitary authority shall appoint in addition such other sanitary officers, including a medical superintendent officer of health when deemed necessary, as the Local Government Board shall in each case direct.

And whereas by the said eleventh section it is further provided that the Local Government Board shall assign to the medical officers of health and to the other sanitary officers, if any, and to the medical superintendent officer of health, if such an officer be appointed for the sanitary district, their respective duties and functions in the discovery or inspection or removal of nuisances, in the supply of pure water, in the making or repairing of sewers and drains, or in generally aiding the administration of the sanitary laws within the district.

Now we, the Local Government Board for Ireland, do hereby order and direct, &c.

Appointment of Sanitary Officers, and Tenure of Office.—The sanitary authority shall, when directed by the Local Government Board, appoint one consulting sanitary officer, or one medical superintendent officer of health, and for either of these offices every medical officer of the union, including the workhouse medical officer or officers, shall be eligible, and also, subject to the approval of the Local Government Board, any other duly qualified medical practitioner.
